deindustrialisation, SMI filled the gap to some extent. SMEs expanded under the export-oriented strategy pursued since mid-80s.

The share of industrial output in GDP which had increased steadily from 19 per cent in the 1960s to 23 per cent in the 1970s declined thereafter to 20 per cent in 1983. The economy recovered in the late 80s and by 1990-91 the share of manufacturing in GDP was back to 23 per cent (as against 8 per cent in agriculture). Manufacturing accounted for 11 per cent of the total employment in 1990-91 as against 27 per cent in agriculture.

The size categories of industry in Mexico are defined as follows: a micro-enterprise is one with employment up to 15 persons and gross income/total sales below 110 times the annual minimum wage (equivalent to $ 1,75,000 in June 1992); a small enterprise is one with employment below 100 persons and income/sales below 1,115 times annual minimum wage; a medium enterprise is one with employment below 250 and income/sales below 2,010 times the annual minimum wage. The non-government institution in charge of the promotion of micro-enterprises, Asesoria Dinamica a Microempresas (ADMIC), however, has a more clear-cut definition, viz, Micro-enterprises (5 or less workers), Small enterprises (6-100 workers) and medium enterprises (101-250 workers).

Table 16 illustrates the relative importance of micro, small and medium enterprises. While they account for 98 per cent of the number of enterprises, employment provided by them is about 50 per cent of the total, but value added is only 41.5 per cent of the total. Of the three categories, the order of importance is small (1), medium (2) and micro (3) in relation to employment and income.

The distribution of SMI establishments and employment by economic sectors shows a concentration in five branches: food products (20.7 per cent); metal products (17.5 per cent), apparel and other textiles (10.2 per cent), printing and publishing (7.0 per cent) and footwear (5.7 per cent). The share of SMI in the output of different products—arranged in order of the extent of the share—and the domestic input coefficients are given in Table 17.

The larger the share of SMI in output, there is also a larger domestic integration of the industry. In other words, a larger share of SMI is related to a larger domestic input coefficient.

In the Federal district, about 75 per cent of micro-enterprises employ 5 or less persons, 80 per cent have a sole proprietor, and 93 per cent were oriented to domestic markets. They mainly compete with each other in a highly segmented market, operating in 66 per cent of the cases on a cash basis.

The situation is somewhat different for micro-enterprises located in the US-Mexico borders. These have a stronger export-orientation and roughly half of them produce for the foreign market. They have informal with sub-contractors and credit arrangements with the medium- and large-scale Maquiladora industry (plants set up in border regions by American and other companies which assemble imported products, tax-free, for immediate re-export duty-free except on the value added in Mexico).

Until the oil boom of the late 1970s and more particularly until the debt crisis of the mid-80s, Mexico followed an Import Substitution Industrialisation (ISI) policy, involving protectionism and licensing and in practice favouring large-scale industries to earn monopoly profits through providing preferential access to resources and through subsidisation. Although there was a programme for SMI development, it was marginal until the adoption of the Export Orientation Strategy (EOS) in the mid-80s.

It is only very recently that Mexico has developed an integrated programme for development of micro, small and medium (MSM) enterprises. Financing programmes have been there since the 50s, but these were benefiting the larger of the MSM enterprises. These have recently been made specifically oriented to different sizes of enterprises under the Federal Law for the Development of Micro-Industry of 1988 and its successor of July 1991. In addition, there are programmes from Non-Government Organisations (NGOs). These programmes will be outlined below.

Programmes for MSM enterprises have been set up by

—Ministry of Commerce and Industrial Development (SECOFI).

—Nacional Financiera (NAFIN).

—National Solidary Programme (PRONASOL).

—Inter-American Development Bank (IDB).

—Asesoria Dinamica a Microempresas (ADMIC).

The specific objectives of the SECOFI programme for 1991-94 are to (i) promote growth in both domestic and foreign markets through improved forms of purchasing, production and commercialisation; (ii) increase the levels of technology and quality; (iii) strengthen deregulation, decentralisation and simplify administrative measures; (iv) encourage development in the regions through deconcentration taking into account environmental considerations; (v) promote productive and long-term employment, based on the lower investment requirements per job created; and (vi) promote investment in social sector manufacturing activities. The main strategic mechanisms that are to be promoted include: formation of entrepreneurial groupings and associations in areas of credit, purchasing and commercialisation such as credit unions, limited liability companies and common purchasing centres as well as joint marketing, subcontracting and public procurement arrangements; promotion of technological services through the creation of a national industrial technology consultation service involving a variety of institutions including LANFI (Laboratorios Nacionales de Fomento Industriel), CONTAT (Consejo Nacional de Ciencia y Technologia) and other R and D and educational institutions and centres; total quality control; business management and training; financing and investment promotion through the development of financial intermediaries supported primarily by National Financera (NAFIN) and programmes such as the National Solidarity Programme; and others aimed at agro-industry, deregulation and decentralisation. As regards technological services, LANFI currently provides services at 50 per cent discount to micro-enterprises and 25 per cent discount to small enterprises.

SECOFI has also set up in 1991 two mixed commissions: Comision Mixta para la Promocion de las Exportaciones (COMPEX) for promoting exports and Comision Mixta para la Modernizacion de la Industria, Micro, Pequene y Mediane (COMIN) to assist modernisation. COMIN is a forum where entrepreneurs can present problems to be solved within 10 days; some 400 out of 900 cases submitted have been so resolved. For micro enterprises the Federal Law for the Development of Micro industry and Handicraft Activity (July 1991) foresees the establishment of a special Intersecretarial Commission. It proposes (a) fiscal, financial, technical assistance and commercialisation support; and (b) administrative simplification for the establishment of such enterprises.

In the area of industrial training for micro and small enterprises a joint programme (CIMO or Capacitacion Industriel de Mano de Obra) is being implemented using 70 per cent World Bank finance and 30 per cent contribution by industrial chambers, associations and enterprises.

NAFIN, the most active institution in granting preferential credits to micro and small enterprises, instituted a programme in 1990 for the Micro and Small Enterprise (PROMYP), to channelise specialised credits to these establishments through commercial banks and other financial intermediaries such as credit unions. Within this programme, specialised support facility exists for micro enterprises which have not had access to bank credit. The credit available covers working capital, machinery, equipment and plant and is backed 100 per cent by NAFIN up to a maximum of 480 million Pesos. NAFIN credits are extended through trust funds (a mixed fund of the State and NAFIN) known as Programma de Apyo a le Micro-industrie (PROMICRO) and meant to support micro industry. Almost 60 per cent of NAFIN credit in 1991 was allocated to the micro and small industry programme.

PRONOSAL (The National Solidary Programme) assists underprivileged groups through a system of matching grants to groups of producers in depressed areas pro-

vided through the National Fund for Support to Solidarity Enterprises (FONAES) established in December 1991. FONAES operates through NAFIN and its regional funds, which provide the technical and financial monitoring and backstopping.

The Inter-American Development Bank (IDB) has since 1978 provided soft loans of a maximum of US $ 5,00,000 for each micro/small enterprise through non-profit intermediaries, e g, co-operatives, associations and foundations. In 1991 Mexico received US$2.5 million through 5 projects. These are long-term loans for a period of 20 to 25 years, repayable in local currency. The IDB's experience indicates that programmes concentrating on the widest possible coverage (the so-called 'minimalist' programmes) could achieve results as good as programmes which focus more on training or technical assistance. The main lesson which it has drawn is that micro enterprise credit programmes should be managed as a business and should be separated from philanthropic activities. The bottleneck has been the limited capacity of NGOs to manage the programme.

ADMIC, the largest non-government institution in Mexico that provides direct assistance to micro-enterprises, covers eight states (in the centre and north), and from 1980 to mid-1991 provided credit to about 7,300 micro-enterprises, mostly in the last four years. ADMIC's main source of credit is NAFIN, with which it has established a trust fund of US$6.7 million. It has also received an IDB credit under the IDB small loans programme. ADMIC's loans tend to start below $500. In addition to credit, it also provides technical assistance and training.

Fundacion Mexicana para el Desarrollo Rural (FMDR) is the other major NGO in Mexico. It is a federation or network of autonomous foundations or centres which operate in a decentralised manner in the field of rural development. FMDR aims at promoting the creation of such centres. It provides them certain services and facilities and access to institutionalised credit (NAFIN, IDB).

Mexico's comprehensive programme for promoting and assisting MSM industries is of recent origin. Mexico's joining NAFTA (North American Free Trade Area—US, Canada, Mexico) is not likely to affect micro-enterprise catering to local markets. On the other hand, it will provide further opportunities to them as well as to MSM in export orientation of industries through linkages with larger firms as well as foreign enterprises and multinationals. Regional and local institutional arrangements will have to be strengthened, small and medium enterprises encouraged to be upgraded technologically and advantages of clustering or collective agglomeration realised by all the three segments—micro, small and medium.

Conclusion

Mexico's programme is of recent origin. The specific attention paid to micro-enterprises is noteworthy for other countries. Assistance is carried to the local level through arrangements with NGOs and co-operatives of enterprises. Funding is provided through multiple participation: national development bank, regional or state governments, NGOs, associations and commercial banks. Provision of credit and services has been decentralised through intermediation by financial and regional agencies. Provision has been made for venture capital financing, separation of commercial loans from grants, R and D and technology development. The Ministry of Industry has created joint commissions to co-ordinate the activities of the large number of agencies involved in the programme, which has not been in existence for long enough to provide an evaluation of experience.

III
Lessons for India

There are wide variations in the size-structure and size-composition of enterprises between countries, even among the countries of more or less the same level of economic development. This is due to the interplay of historical, legal, institutional, cultural, social and economic factors which are specific to countries or regions. A conclusion of country case studies is that the size of enterprises or establishments does not crucially determine business performance measured either in economic or social terms. Instead, business performance depends decisively on organisational structure and on the public and private policies which influence their development. Rapid changes in technology and management practices and increasing role of services are revitalising the small-scale sector all over the globe including industrialised countries. It is amply clear that in the development process SMI will continue to play a significant role, based on competition, productivity and efficiency.

While the Indian small industry programme from the mid-50s to the mid-60s was based on direct technical assistance in identifying opportunities and markets, in techno-economic viability of size, in appropriate but efficient technology, and in promotion of new entrepreneurship, it soon degenerated into a lobby—like its counterpart the private large industry sector—for currying government favours in reservations, tax exemptions, licences and quotas for scarce materials and foreign exchange, subsidised loans, etc, thus stifling technological change and sheltering sub-quality and spurious manufacturing. The industry sector, including the small-scale sector, finds it difficult to get out of past distortions and from the embrace of politicians and bureaucrats, who in turn want to continue to license and regulate. To take only the garments and leather goods subsectors, while exports are rapidly expanding, the western foreign buyer, like the earlier Russian buyer, has to implement a tight quality inspection programme, with frequent visits to factories in India, to assure acceptable quality; and yet the percentage of rejects is considerable, as seen in their diversion to the domestic market. To take another example of the jewellery and diamond trade, not only are exports net of imports of raw diamonds and gold, small; training is provided under not so uptodate working conditions and tools and as yet low wages, and in industry with high value added. Adapting to economic reforms in a globalising economy demands a drastic change in mind-set, in work culture and attitudes towards business ethics, zero-defects culture, striving for continuous skill upgradation and for excellence.

The quantity and quality of infrastructure and services provided, particularly in Northern India, leave much to be desired and undoubtedly affect adversely the operation of small enterprises. To the factors mentioned in the last paragraph should be added the irresponsible attitudes of labour, bank, telecom and government employees and their unions. Since the new technology of flexible specialisation demands the widespread use of computer and of telecom networking, and since these are achieved through skill development as well as through close and co-operative working relationships with providers of other goods and services, with R and D institutions, universities, training institutions, information channels, etc, brought together in clusters or collective agglomerations such as industrial districts or parks, the Indian small business culture of the individual loner is no longer robust. The change in mind-set required is indeed revolutionary and might take another generation to fructify, if serious efforts commence now. Meanwhile we should probably take full advantage of traditional capitalistic mass production methods using cheap unskilled labour to derive advantages of scale economies.

Statistics on small-scale industrial enterprises are notoriously inadequate in India because of overlapping definitions for regulatory and assistance programmes, changing coverage, exclusion of self-employed or own-account enterprises and no-reporting of closures or mortalities. A guesstimate is that 30 million people are on own-account manufacturing, (including village and town artisans and craftsmen), 10 million employed in the small-scale industry sector (both factory and non-factory) and about 5 million in large-scale manufacturing industry. Roughly 50 per cent of manufacturing output is from small industry. The rate of growth of output seems to have declined both in large and small industry since the mid-70s; in the second half of the 80s the rate of growth was 9.2 per cent for large industry, but only 5.2 per cent for small industry. While no data are available the share of small manufacturing output supplied to large industry, institutional buyers

and export houses, as against direct supply to domestic markets, appears to have considerably increased. While no data are readily available, it would also appear that a considerable number of small enterprises have expanded into medium and large categories, especially in garments, leather, food processing and engineering (auto parts and other machinery tools and components).

Liberalisation of the economy and the strengthening of market friendly and competitive influences, do not, and should not, mean a *laissez-faire* policy particularly as regards industrialisation and economic development. A long-term planning and perspective for growth of and structural changes in the small-scale sector is essential. The examples of Japan, South Korea and Malaysia are most relevant. The government has to take the leading role in close co-operation with private business and industry in a 10-year projection of India's role in the world perspective and the detailed measures required to achieve the targets formulated.

The industrial structure and its size distribution have to be looked upon as a continuum of different sizes co-existing as competitive and viable units. Growth and expansion and establishment of new units as well as closure of sick or bankrupt enterprises have to take place. This integrated structure should also contemplate meaningfully linked enterprises in the services, construction and trade sectors.

Most of the country experiences underline the vital role of the state and other public/institutional entities in the promotion and development of SSI. In Japan special banks and financing institutions, with regular sources of funds, have been established to meet the requirements of small enterprises. Programmes for modernisation, technological upgradation, quality-adherence have been formulated and undertaken by government or government-supported agencies in Japan. In the US local and state governments and institutions established by them and by associations of business have assisted in planning industrial and infrastructural facilities, industrial estates, R and D facilities and links with universities and consultants. Venture capital financing has also been provided for. In Germany, France, Austria, etc, the craft system has been legally based and self-governing institutional arrangements have been encouraged and assisted by government agencies, for provision of training, R and D and improvement of productivity. In Italy collective agglomeration in regional centres specialising in specific products and services has been assisted by local governments, industry associations, research institutions, banks and consultancy firms.

Except for micro or tiny enterprises, other small and medium enterprise categories are usually able to take advantage of services provided through existing market network and commercially operated institutions, including large enterprises, which often provide better quality and more cost-effective services than are possible from government-operated agencies. It is thus the very small firms (micro or tiny) which are disadvantaged in access to resources and services. Government efforts should, therefore, focus on this category (employing say to 10-20 or less workers) and on disadvantaged groups, e g., prospective entrepreneurs in backward or rural areas, or on backward classes or on women. Experiences of China, Malaysia, Mexico and the US are especially relevant in this connection. There is need for specific institutional arrangements and separate funding in association with national, regional and local governments, private and voluntary organisations. Assistance needs to reach the enterprise through decentralisation and intermediation (under a variety of arrangements). Venture capital financing, separation of commercial from grant type of requirements, and provision for dissemination of information, continuous training and upgrading, R and D, monitoring, etc, needs to be made.

While licensing and regulation by a single central authority stifles growth and dynamism, provision of facilities in a decentralised manner, through local authorities and industry associations in growth centres, hi-tech industrial estates, etc, is necessary for the development of SSEs. A few specific suggestions are indicated as follows.

R and D in many countries tends more and more to be carried out in public research institutes, universities, etc, and there is need to provide for linkages and transfer mechanisms to small enterprises.

Financing should be provided preferably—as in Japan—by separate institutions catering to small enterprises. Such small business banks in dispersed locations could develop close client relationships and also be able to link up with informal channels of capital and credit.

Collective agglomerations in similar or related products and trades (either of the Italian-type or the US research park-type) has been found to provide external economies of scale and scope and to contribute to the success of small business. These are akin to what were called functional industrial estates, single trade industrial estates and ancillary industrial estates in India in the 50s and 60s. In the planning of mini growth centres, growth centres and hi-tech industrial estates, the advantages of collective agglomeration should be sought to be realised in practical terms.

The trend towards closer and greater relationships between large enterprises and small enterprises is likely to be strengthened. A programme is needed to encourage independence of small sub-contractors and reduction of exploitation by eliminating or removing unfavourable rates of payment, delayed payments, etc. Small enterprises should themselves organise for this purpose and build up countervailing power, with government and legislative support.

Total quality control and zero-defects culture should be spread through associations, trade unions, productivity and managerial organisations, etc.

A time-bound programme is needed for disseminating and promoting the use of computers and modern telecommunications in small enterprises.

An action-oriented research programme on the flexible manufacturing system and its application to small-scale enterprises might be undertaken by an institution e g, the Confederation of Indian Industry (CII), in close co-operation with specialised industry sector research institutes, e g, in leather, mechanical engineering, ceramics, food, etc.

However difficult it may be under Indian conditions, it should be stressed that the beneficial longer-term institutional arrangements for small enterprises lie in 'bottom-up' organisation of communities of small businesses to build up support systems for themselves, rather than dependence on larger enterprises or on government agencies undertaking 'top-down' programmes.

Where Are the Entrepreneurs?
What the Data Reveal for Tamil Nadu

Padmini Swaminathan

While maintaining its position as one of the three leading industrial states of the country, Tamil Nadu has nevertheless over the years lost considerable ground and many opportunities. This paper attempts to understand the factors underlying the loss of dynamism of Tamil Nadu's industrial economy.

THE success of the reform measures initiated in the country since the middle of the 80s depends to a large extent on the performance of the private sector in the economy. On the assumption that the entrepreneurial ability and capability should get reflected in data depicting existing industrial activity and intentions to invest, we have attempted an examination of such data. We have confined our examination to the state of Tamil Nadu *vis-a-vis* the western states of Maharashtra and Gujarat. While maintaining its status as one of the three leading industrial states of the country, Tamil Nadu has, neverthless, over the years, lost considerable ground ahd opportunities. We attribute this largely to a combination of two factors: (a) the low risk taking capacity of the existing established business houses combined with an inability to diversify into new and unchartered areas, and (b) the inability of the state in Tamil Nadu to create an atmosphere conducive to the emergence of small and medium entrepreneurs on a large scale.

There is no disputing the fact that Tamil Nadu is one among the leading industrialised states of the country. Several indicators bear this out. Data in terms of share in number of factories, number of employees, value of output and net value added (for the registered manufacturing factory sector) show that Tamil Nadu has remained within the top four states (Table 1). The weighty impress of such data notwithstanding the opinion is widely and frequently expressed that the pace of industrial growth in the state has slackened considerably in recent years.

Many look back to the early 60s when industry in the state forged ahead, when some large central projects were started and the expansion in the private sector was also marked, especially in the automobile and auto-ancillary industries. The growth in the small-scale sector also started at this time together with the clustering of such units in and around Madras city and Coimbatore. In contrast to the euphoria that prevailed then, a psychology of defeatism began to take over since the mid-70s. The sluggishness of the industrial growth seems to stem from the early 1980s; more important, an examination of the industrial structure reveals since the late 70s a failure to diversify both within broad industry groups and away from them.

This study is an attempt to understand in some depth the factors underlying the loss of dynamism in the industrial climate currently characterising the Tamil Nadu industrial economy. A comparison with Gujarat and Maharashtra, particulary, shows very starkly at various levels the absence of a spirited competitive approach to tackling the industrial problems of the state. More important, both at the political and at the operational level the culture of communication, consultation and interaction between the various actors making up the *dramatis personae* of the industrial economy of the state (so vital to the dynamic functioning of the economy), has not been nurtured—the consequences of which the state is now reaping. While an academic exercise can draw out the implications of such lack of communication between the different parties the concrete operationalisation of such process cannot be legislated. Barring certain guidelines delinealing very basic ground rules of operation, a culture of very strong conventions and a functioning bureaucracy that is effective has to be built up, which art the states of Maharashtra and Gujarat seem to have perfected to the advantage of their economies. The experience of dynamic growth in Maharashtra and Gujarat cannot be reduced to just historical and natural advantages but

has a lot to do with the aggressive manner in which the state governments in tandem with the corporate sector have been able to set a pace of continuing growth.

The ordinal ranking of states given in Table 1 cannot however indicate the magnitude of the gap that separates Tamil Nadu from the top state in the order of ranking, nor the direction in which this gap is moving over time, that is, whether at an increasing or decreasing pace. It is important to emphasise in this context that, keeping pace and/or overtaking the current top industrialised state in the country is not being advocated as a goal/end in itself, nor does this by itself have any virtue. And yet, given the present changes in the industrial policy of the country, a slowing down/ sluggishness in private industrial activity in the state is symptomatic of a loss of dynamism which is disconcerting and needs to be looked into.

Analysis of the Problem

The data that we have assembled here from several (published) sources give an idea of the nature and pattern of industrial activity in the three states of Gujarat, Maharashtra and Tamil Nadu. The deceptiveness of an ordinal ranking (wherein Tamil Nadu is shown to have fared quite well in terms of certain indicators) becomes very apparent when data pertaining to specific industry groups are examined.

Appendix I gives the share of three important states in the total value of gross ouput and net value added in each of 23 major industry groups. The data clearly vindicate Maharashtra as the most diversified and an important contributor to 21 out of 23 major industry groups. Tamil Nadu is an important contributor to 10 out of the 23 industry groups. What is however significant from our point of view is the fact that Tamil Nadu ranks first in two industrial categories, namely, Cotton Textiles and Leather and Leather Products. This domination of traditional lines of activity with weak performance in other lines of activity gets corroborated further when data pertaining to changes in net value added and value of output are examined for specific industry groups (Appendix II and III)

The industry categories in which Tamil Nadu has shown an almost consistent increase in net value added and value of output between 1979-80 and 1987-88 include the following:

(1) Beverages, Tobacco and Tobacco Producis (Group 22)
(2) Cotton Textiles (Group 23)
(3) Textile Products (Group 26)
(4) Leather and Leather Products (Group 29)
(5) Non-metallic Mineral Products (Group 32)
(6) Machinery, Machine Tools and Parts (Group 35)

Industrial categories in which Tamil Nadu has shown a clear decline in both net value added and value of output between 1979-80 and 1987-88 include:

(1) Synthetic Fibres (Group 24)
(2) Chemical and Chemical Products (Group 31)
(3) Transport Equipment and Parts (Group 37)

Industrial categories in which Tamil Nadu has shown a decline in net value added but a marginal increase in value of output between 1979-80 and 1987-88 include:

(1) Paper and Paper Products (Group 28)
(2) Basic Metals and Alloys (Group 33)
(3) Metal Products and Parts (Group 34)
(4) Electrical Machinery and Parts (Group 36)

The data also reveal that, while Maharashtra's share (among the three states) has come down in many of the industries, the industrial base in Maharashtra is still quite large and strong with shares exceeding 50 per cent in most of the groups.

Gujarat has grown at the expense of both Maharashtra and Tamil Nadu in quite a few of the upcoming and growing industries, namely,

Group 34—Metal Products and Parts except Machinery and Transport Equipment

Group 31—Chemical and Chemical Products

Group 36—Electrical Machinery and Parts

Group 33—Basic Metals and Alloys'

What comes out clearly from the above analysis is that diversification (both within broad industry groups and away from them) has not been a strong point of the Tamil Nadu industrial structure. Further if one examines the industry groups where the share of Tamil Nadu has clearly declined, particularly, industry groups 24, 31, 36, 37—these are precisely the industries where large investments are the order of the day; these are also the industries which spawn the growth of many related items thus imparting to industrial activity a momentum of its own. And these are also the industry groups (except industry group 37) where Gujarat has entered into direct competition with Maharashtra leaving Tamil Nadu far behind in the race.

Over the years the share of Tamil Nadu in total central investment has either remained constant or increased only marginally (Table 2). It may be argued that in relatively developed states (and Tamil Nadu is one of them) one would expect a decline in central investment with greater attention going to the relatively backward states. Hence the low share in central investment should not by itself be taken as an indicator of declining industrial activity. What needs to be noted in this context is that there has been no change in the position of Maharashtra which continues to rank first as far as share in total central investment is concerned. The decline in central investment by itself would not be a cause for alarm had it been compensated by, or were it to be compensated by, say, investment in joint sector and/or private sector projects in the state. It is to an examination of such data that we will now turn.

Investments Envisaged

(a) It would be interesting to examine the projects coming up in the three states against the above background. For the analysis that follows we have used data compiled by the Centre for Monitoring Indian Economy in their document entitled *Shape of Things to Come*. In the first place it needs to be noted that the total investment envisaged in Tamil Nadu is of the order of Rs 18,857 crore as compared to Maharashtra's Rs 43,609 crore, Gujarat's Rs 42,882 crore and Andhra Pradesh's Rs 31,316 crore. (Details in Table 3.)

(b) The investment envisaged in the manufacturing sector of Tamil Nadu as compared to all-India works out to 6.35 per cent which is way below Maharashtra and Gujarat, the top two in terms of quantum of investment

(c) Among large projects involving an investment of Rs 500 crore and above, Tamil Nadu has only 5 projects involving an investment of Rs 6,196 crore which works out to 4.89 per cent of the total investment in such large projects at the all-India level (Table 4).

(d) Of the total investment envisaged in the private sector of the country, Tamil Nadu's share is only 5 per cent against Maharashtra's 28 per cent, Gujarat's 11 per cent and Andhra Pradesh's 9 per cent (Table 5).

(e) Appendix IV provides details of investment in specific industry groups together with the parties to the investment programme (government, joint sector, private sector etc). The data for Tamil Nadu has been extracted in Table 5.

Taking the industry groups 28, 31, 33, 36 and 37 in which (in terms of net value added) Tamil Nadu has shown a clear decline in terms of net value added, we find that only 37.46 per cent of the total investment envisaged in these industries is in the private sector, the rest being in the government and joint sector. Given the record of performance of both these latter organisations there is nothing very encouraging in the emerging industrial scenario as far as Tamil Nadu is concerned.

Share in Institutional Finance

A further corroboration of the comparatively low key level of private and public sector industrial activity in Tamil Nadu can be had from the sanctions and disbursements made by all-India financial institutions. We present Tables 7 to 10 extracted from the data provided by these institutions.

Among the financial institutions, IDBI's share forms the single largest component in each of the states—more than 50 per cent in the case of Gujarat, and Tamil Nadu and 42 per cent in the case of Maharashtra. A break-up of IDBI's project finance schemes statewise and sectorwise reveals Tamil Nadu's low share as compared to Maharashtra and Gujarat, and a particularly dismal picture as far as projects in the private sector are concerned (Table 8).

Mention was made earlier of very few large projects (of Rs 500 crore and above) emerging on the industrial horizon of Tamil Nadu. A similar picture emerges when one calculates the average size of projects (public, private, joint, etc), financed by IDBI in the state. The disparity in the average amount of assistance sanctioned was particularly marked in respect of private sector projects (Table 10).

The data put out by the financial institutions clearly bring out that recourse to institutional finance by industry in Tamil Nadu is at a comparatively low level. This in turn would imply that projects conceived in Tamil Nadu are by and large being financed by resources generated from within and/or by borrowings elsewhere. This phenomenon to a large extent explains why the average size of projects coming up in Tamil Nadu is not very large as compared to Maharashtra and Gujarat.

A related aspect is the relative under-development of commercial sophistication in Tamil Nadu measured in terms of the adoption of the corporate form of business. Further, the preference of savers in Tamil Nadu—and in the southern region generally—has traditionally favoured non-financial assets. This bias has persisted to some extent despite the massive branch expansion by banks and the introduction of a wide variety of new savings media. The growth

in bank deposits, for instance, is not commensurate with the spread of banking or the long exposure that a state like Tamil Nadu has had to commercial banking For their part many industrialists in Tamil Nadu prefer close-holding of share capital This type of savings and investment psychology places a very low premium on risk taking The combined effect of all these features is to reduce the capital market activity in the state to low proportions

State Promotional Activity

Underlying and complementing private industrial activity in the states of Maharashtra and Gujarat is the strong presence of their respective state governments discernible in the scale and magnitude of promotional activities undertaken by them Thanks to the chairman, State Industries Promotion Corporation of Tamil Nadu (SIPCOT), we have been able to obtain detailed information giving (for SIPCOT estates) the number of units in production those closed, yet to commence, etc

Even a casual perusal of the data brings out very clearly the low scale of activity in SIPCOT estates, particularly the meagre investment of Rs 35,543 lakh made by SIPCOT's functioning units One cannot help asking why a body like SIPCOT, which has been in existence for 20 years could not have done better in terms of the number of units in existence under its aegis and within this of the number of units in production (Tables 13 (a) and 13 (b)

Concluding Remarks

Our data show that, as compared to Maharashtra and Gujarat, private investment forthcoming in Tamil Nadu is low, further, we have also seen that, while there has been a consolidation and even substantial growth in certain 'traditional' lines of business, there is not much going into (and even less private investment in) 'modern 'growing' industries On the other hand, the backbone of the Gujarat and Maharashtra economy seem to be their private sector In the changing industrial scenario of the country, with greater emphasis being placed on the private sector to spur economic growth in the country, this stagnation /sluggish performance of the private sector in the state could have severe long-term implications One indicator of this is the high unemployment figures that Tamil Nadu has, another indicator is the marginal increase in private sector employment in manufacturing (If it is argued, as some have done, that the primary aim of industry is not to provide employment, then the question of how the population of the state/country is to take care of itself still remains)

Our reading of the situation runs some-

Table 10 Project Finance Scheme—Average Size of Project Cost and Assistance Sanctioned IDBI

trial estates and other industry-related promotional activities have managed to expand the entrepreneurial base of their economies to encompass especially those not belonging to already established business groups/houses In the process they have also been able to attract entrepreneurs from all over The combination of an inherently dynamic entrepreneurial class willing to assume risks and an aggressive state government tuning its promotional activities to facilitate the setting up of industries has imparted considerable dynamism to the economies of Maharashtra and Gujarat

It would not be wrong to state that in contrast to the situation in states such as Maharashtra and Gujarat entrepreneurship in Tamil Nadu is characterised by a pronounced timidity There appears to be an endemic inability to assume risks and conceive of and implement large projects Such development on a larger scale that has taken place in recent years is insular and inbred with the same few business houses

oming up with expansion and fresh proosals. The entrepreneurial base at the evel of medium and large industries is yet o expand to include new classes of people. Inder such circumstances one would have xpected the state to intervene in a more ffective manner. On the contrary the style f functioning of the state has, over the ears, not only alienated the established usiness classes but, worse, it has deterred ne significant emergence of new entrepreeurial classes. The textile products indusy group and leather products industry roup (where Tamil Nadu ranks first) are eally small pockets characterised by virant entrepreneurial activity with minimal nput from the state government.

The tendency to appoint politicians to e top positions of state level promotional gencies has not been in the interest of the tate at all. Further (and it could be a onsequence of this phenomenon), the freuent shifts at the top executive levels has evented, among other things,

(a) continuity/stability in policy,

(b) strong conventions in modalities of nctioning being established,

(c) innovative measures being tried out ecause of constant fear of change, and

(d) accountability being fixed for nonrformance since sufficient period for rformance was never given.

Without labouring the point further we sh to emphasise that, the creation of a vourable' climate for industry cannot d with periodic announcements of introduction policies bringing in more institus and/or concessions and subsidies. In se we have not even identified our ic problem to be able to address it. Our alysis has pointed out, among other ngs, the decline in share (in Net Value Added) of Tamil Nadu in quite a few important industry groups. Assuming the validity of our argument the question then arises on what basis have 'thrust areas' in subsequent industrial policies been identified? Who is to give these industries a thrust? and what kind of thrust is being contemplated?

The low key performance of the private sector is only one part of the story. What is also conspicuous by its absence is a particular quality of leadership and a certain measure of aggressiveness necessary to convert handicaps/disadvantages into opportunities. At present the interaction between government and industry is at a very superficial level which does not allow for the fruition of any objective since to a large extent the bulk of the private sector does not seem to talk in one voice and approach the government with concrete/operationally feasible proposals.

[This paper is based on a study sponsored by the Madras Chamber of Commerce, Madras, towards the end of 1991. A version of the study was presented at a seminar organised by and held at the Entrepreneurship Development Institute, Ahmedabad in March 1994. I am grateful to the participants at the seminar whose comments have helped in bringing out this revised version.]

New Economic Policy, Workplace and Human Development

Prayag Mehta

The new economic policy (NEP) is being implemented in the country with the claim to make the Indian industry more 'competitive'. Such competitiveness has, however, to be obtained in the society and at the workplace where the productive energy of the people has to be released for greater innovativeness and creativity. With the growing unemployment in the country and the threatened 'exit' and 'downsizing' which is likely to result under privatisation, the society, as a whole, and the workplace, in particular, may have to suffer moral and mental health problems. These would suck into the self-esteem and self-efficacy of workers and would, thus, directly hit their skills, capability and human development.

I
Introduction

THE new economic policy (NEP) and its structural adjustment programme profess to make Indian industry more competitive—both domestically and globally. There is now emphasis on reduction of public sector expenditure by disinvestment of government share and on shifting public sector from being a model employer to a model profit-earner. Such a policy is likely to have adverse effect on the country's workforce of some 306.8 million, i e, 37.8 per cent of the total population. Some 90 per cent of the workforce is engaged in the unorganised sector and only less than 10 per cent in the organised sector. Two-third of it, i e, 18.96 million of the organised workforce of about 26.75 million persons, was employed with the public sector and the rest, i e, 7.69 million persons with the private sector.[1]

The policy of deregulation, liberalisation and disinvestment of public sector share is likely to result in its privatisation. The social dimensions of the public sector policy are being diluted and much more weightage is being given to the profit criterion in memorandum of understanding (MoU) between the administrative ministry and the given public sector enterprise. This implies to banking and insurance industry as various committees have suggested their restructuring.[2] The public sector employees including officers and managers, are, therefore, naturally agitated as they apprehend loss of job security and retrenchment at their workplace as a result of these new macro-economic policies.[3]

The apprehensions of the organised sector employees have to be viewed in the larger context of growing unemployment in the country. As is well known, the growth in population in urban areas, for example, between 1983 and 1987-88 was 18.7 per cent whereas the growth in employment was only 16.1 per cent. In rural areas, the corresponding figures were 7.4 per cent and 4.2 per cent during the same period. Thus, the growth rate in employment has been decreasing for the last several years. The rate of self-employment has declined in rural areas and increased in urban areas with increase in casual labour in both urban and rural areas. Growth of employment in the organised sector accounted for only 8 per cent showing decline in employment in this sector. The gap between the growth in economy and the growth rate in employment has thus been widening for the last several years.[4]

In addition to the widespread unemployment, insecurity in the organised sector has been reinforced as managers have been consciously minimising the number of regular workers and replacing them by non-regular workers on low wages. Despite legal protection, the companies have found ways to shut down by using various methods such as precipitating strikes and/or lock-outs, stopping supply of water or power and even repayment of bank loans, thus forcing the plant to close down.[5] In such a context, it is quite understandable that, the workers and even officers and managers, in both public and private sector, feel greatly concerned with the NEP. Such a macro-economic situation and the micro-level apprehensions are likely to have profound impact on the workplace.

It appears somewhat contradictory to talk of human resource development at the workplace under such a situation. As the NEP and the externally imposed conditionalities are being implemented (in India and several other countries) there has been during the same time, an increasing stress on human development, which has been stimulated by the recent UNDP Human Development Reports.[6] Public Action and wider societal participation are the core of human development, which are adversely affected by socio-economic conditions, particularly when proper state interventions are lacking.[7]

In this paper, we take a brief look at the implications of the NEP for work, functioning of the workplace, quality of work-life and mental health of workers and others and examine whether the new policy would release creativity and innovativeness for competitive excellence, as is being claimed.

II
Work, Mental Health and Quality of Life

There has been a long tradition of research on job-satisfaction at workplace in western countries and also in India. Indian studies have highlighted the importance of objective economic factors like salary, living conditions and job security and subjective factors like sense of satisfaction with such socio-economic factors. Conversely, employees in relatively lower income group with lower job security and those who perceived their income and economic conditions as not satisfactory showed low satisfaction in life and at work.[8]

Work and Mental Health

Satisfaction at workplace has long been associated with some important symptoms of mental health. Feelings of helplessness, withdrawal from and alienation at work and sense of pessimism among assembly-line workers have been found to be associated with lack of influence over future course of their lives. In craft like industries, such as printing, where the workers still had high degree of personal control over their work having highly internalised standards of workmanship—the workers showed higher degree of self-esteem and self-worth. Such workers also showed greater interest in social and political institutions of the community.[9]

Thus, the long accumulated experience shows that the work environment in industry where worker can use only few abilities and exercise little or no control over his work may result in decreasing sense of self-efficacy and initiative. Such cumulative effect over a period of time may influence employee's view of themselves, their self-esteem, satisfaction in life and indeed the meaning of work.[10]

Several studies including some longitudinal studies of work satisfaction have revealed it as one of the strongest predictors of longevity.[11] The second-best predictor was the overall happiness. These two socio-psychological measures predicted longevity

ltter th in the rating by a physician l lings developed at the workplace and in coune to work situation therefore emerged i an important measure of health and sickness [1] Job satisfaction low self esteem occupational stress rapid change in employment incongruity between job status and other aspects of life such as high educational attainment but low job satisfaction lack of stability security and support in the job environment have been identified as high risk factors in this connection

Thus, as Kornhauzer pointed out long ago, "persistent failure and frustration bring lowered self esteem and dissatisfaction with life often accompanied by anxiety, social alienation and withdrawal, in narrowing of goals and curtailing aspirations—in short poor mental health" [13]

Workplace Participation Industrial Democracy

The foregoing discussions suggest a very important relationship between democracy in society and democracy at work Liberal social thoughts propounded in 19th and early 20th centuries have contributed to the concept of industrial democracy Following which, it was suggested that trade unions could work as co managers of industry It was further suggested that democracy should be applied to workshop where the workers could elect and control their managers insofar as production process was concerned [14]

Such liberal thoughts were however greatly resisted by the entrenched vested interests As a result, participative approach and democratic management have continued to come under fire from them Work democracy is hardest to reconcile with exploitative practices [15]

The economic crises of 1970s and 1980s in western countries particularly in the US ...ging profile of labour force and new socio-political values stimulated the concept of industrial democracy and democracy at the workplace Workers resistance of managerial control various participatory movements like women movements student movements, etc, had heightened the consciousness for democratisation at the workplace Literature, national and international seminars and conferences—all contributed to dramatic urge for workers participation increasing consciousness for better work environment for safety and health and for general well being of the workers These created the awareness that change was required at the workplace and not in workers [1]

In India, there has been persistent talk about people s participation in development and workers participation in management The Second Five Year Plan recommended the introduction of workers participation and involvement for the purposeful implementation of the plan It was visualised that such a measure would help promote productivity for the general benefit of the employees as well the community and for satisfying the workers' desire for self-expression leading to better industrial relations and increased co operation [17]

The idea of workers participation in management has indeed a chequered history in India beginning with the introduction of statutory Works Committee under the Industrial Disputes Act, 1947 A survey showed that in 1968, Joint Management Councils (JMC) were functioning only in 131 out of about 18,000 enterprises in the country [18] The National Commission on Labour also found that there was not much support for the institution of Works Committees or JMC Among other causes, the failure of such forums was due to lack of interest and opposition of the employers [19]

Such disappointing experience probably led to the Article 43A of the Constitution making workers' participation as one of the directive principles of the state policy Subsequently a bill for this purpose was introduced in the parliament in 1990, which is still pending [20] With the role of state being diluted under the new policy and private enterprises and employers getting the upper hand under privatisation, the fate of the bill and of workers' participation in decision making at the workplace can very well be imagined

Quality of Work-Life

Studies of job satisfaction and job-design led to movement for quality of work life in western countries and also in India [21] Such a movement was spurred by studies which identified certain important characteristics of work organisation which tend to lower the quality of life Such factors include single job design and fragmentation of job to fit man in simple division of work, supervisors keeping a watch over men glued to single job tendency to enforce compliance by various methods including manipulation and coercion and job fragmentation in order to reduce cost of training and skill upgradation In such a work situation man becomes an extension of machine [22]

Mental health aspects of work, particularly its negative factors and the importance of quality of work life in promoting human development gave fillip to social planning at the enterprise level It is widely believed that an enterprise should at least serve two main purposes (i) it should produce goods and services in most efficient and economic ways and (ii) it should provide meaningful work situation to its employees for their personal growth and self-fulfilment [23] These social and work values gave further boost to the movement for workers' participation industrial democracy and quality of work life

The new economic policy, by its overemphasis on privatisation and profits and under-play of the role of state, has moved away from social development goals Such a radical shift is likely to undermine the social objectives of work and the movement for quality of work life with deleterious consequences as the case studies briefly discussed in Section V suggest for the workplace as well as human development [24]

III
Self-Action, Motivation and Empowerment

People's involvement in initiating self action and their participation in such projects facilitate their human development by releasing their morale and motivation In such autonomous situations, people take initiative for obtaining literacy, voluntary prohibition, wells and irrigation, primary education, vocational training, social and political awareness and for fighting against moneylenders and corrupt public officials [25] Review of several such participatory projects in several countries shows that people are not only able to improve their skills and access to productive resources but they also succeed in enhancing dignity and status of their labour [26] They, thus, move away from being pawns in the hands of their superiors and dominators to becoming actors in improving and managing their lives [27]

Participation and Empowerment

Self action and participation at the workplace, like self-action in socio economic programmes, release their productive energy and empower them Analysis of disempowering conditions and managers' enabling strategies for enhancing workers' self-efficacy enhance the process of their empowerment [28] However it is not just sharing of information and consultation, but active participation and self action, which accelerate workers' motivation and empowerment [29] These, i e, participation and empowerment, in turn are essential ingredients of human development Thus, analysis of conditions leading to powerlessness implementation of suitable managerial strategies information sharing with subordinates for enhancing their self-efficacy, providing subordinates with empowering experience such as strengthening their personal efficacy, and activisation of behaviours like initiative and persistence for accomplishing basic objectives enhance workers' (and also managers') empowerment Both objective and subjective conditions interact at the workplace in promoting such a development and the people's well-being and quality of life [30]

Success experience at challenging jobs, enable people to stretch, develop their skills and prepare them for complex tasks Such learning promotes a sense of self-confidence It also helps them in acquiring a positive self-image Such capability development is the core of human development As people (at workplace) and in civic matters participate, gain success experience, enhance personal

and social efficacy and acquire new skills They also learn a new sense of hopefulness [31]

Collective Action

There are now several examples in India where employees have taken collective initiative in order to solve problems such as industrial sickness For instance in one sick plant engaged in manufacture of engineering equipment, the management was unwilling to restore the sick factory while the workers were keen to begin production The workers then took the initiative and prepared an action plan to achieve a growth rate of 10 per cent They succeeded in putting the plant in proper operation and in getting profit in the first year of its operation itself [32]

Some studies of public sector in our country show that workers, particularly skilled workers, as well as some managers have a need for social achievement oriented influence, which motivates collective action in them [33] Such needs are also reflected in the workers' takeover of sick plants and people s self-action for development as mentioned above They feel challenged and motivated to act on the environment for social achievement Such tasks facilitate the release of their 'collective creativity' [34]

Such psychological needs for co operation collective action and social achievement could be usefully activated for obtaining readiness for public good, better quality of life for the society, for environment protection and sustainable development and for raising productivity for the benefit of all Acting in collaboration with each other beyond the state's reach' as Friedmann has argued, 'they can work for collective self improvement' [35] Learning to work together with each other rather than against each other, is not just important for productivity at the workplace In fact, it is "one of the essential elements for survival of human civilisation It is essential that people develop "greater sense of co-operation, of community, ability to work together for the common good, not simply for personal aggrandisement" [36]

An increasing body of empirical as well as theoretical research thus, shows that, though common people possess adequate internal resources for obtaining good life for themselves as well as for the society, this is vitiated by cut-throat competition As discussed in Section V, profit grabbing corporations, high-powered advertising, unbridled consumerism and various other such institutions tend to vitiate the natural human tendency to help each other for achieving a common cause and such other social goals

Structural conditions that fail to meet such needs of co-operation and sharing also create pathologies at the workplace [37] Such violation of basic needs raises important ethical questions about retardation of human potential and promotion of stress and illness at the workplace [38] Some of the motivational theories did not work at the workplace because they tended to under estimate the seriousness of this social problem Some of the management techniques in this respect tend to increase hostility and indifference and disrupt work group solidarities Some such efforts are based on simple pleasure pain and input output calculations [39] In such a situation workers tend to ask what is in it for me They tend to lose their sense of community and become more and more individualistic Competitive attitudes of managers and supervisors create a situation of—one against all- resulting in a self perpetuating cycle of suspicion blaming and reprisal [40]

Such an individualistic and hostile situation at the workplace in combination with all—pervading aggressive and utopian advertising and the consequent consumerism—encourage self aggrandisement populist hedonism and compulsive accumulation Under such profit seeking, competitive and individualistic situation as obtaining in some developed countries as discussed below (Section V) and now being perused in our country under the NEP people lose their ability and readiness for collective solution of common problems and sensibility for the idea of common cause and public interest against private gain [41]

IV
Behavioural Tendencies in Industrial Sector

Any group of people be it in economic political social or business sector tend to develop certain characteristics and tendencies over a period of time There are certain historical determinants of such behaviours Our industry particularly some traditional business houses, show some such tendencies which are reflected in their day-to day business behaviour The NEP will have to reckon with them some of which might be further strengthened/reinforced by it with serious consequences for functioning of the workplace

The new economic policy's functioning on the ground, therefore, has to be understood in the perspective of such behavioural tendencies observed in our industrial sector Some such noticeable characteristics are briefly described below·

Tendencies to Safeguard Private Funds and Spend Public Money The internal resource generation among the private companies themselves has been small and assistance from the public financial institutions and capital market has been quite heavy The tendency is to safeguard their own money and spend the public funds This is reflected in increasing sickness in small industry sector It is estimated that bank funds amounting to Rs 2,141 crore have been locked in 2,40,570 small-scale sick units [42] Case studies of industrial sickness as processed and settled by the Board for Industrial and Financial Reconstruction (BIFR) till end of 1991 corroborate such a tendency Out of 472 such case studies, as many as 239 cases of sickness were caused by mismanagement This included diversion of working capital to other projects purchase of defective equipment deliberate dishonesty and fraud

Low Risk Taking Industrialists/business houses tend to seek maximum profits in the shortest possible time Such a tendency is shown by their eagerness to tie up with foreign manufacturers in order to dominate the market under conditions of low volume demand While profit making is desirable for future growth and development of industry it seems to have become a value in itself When profit becomes end in itself means hardly matter [44]

There are various ways of maximising profits It could be obtained by speculation or by trade or by manufacture The latter is a risky enterprise where gestation period is longer margin is low and profit depends upon the turnover The enterprise of manufacture therefore requires long term perspective proper planning readiness to take moderate risk Entrepreneurship really lies in floating such enterprises where creativity and innovativeness[45] are required and there profit is only an evidence of success and achievement [46] Short term perspective, hunger for quick profits and inability to cope with the vast money power of the MNCs and their aggressive instinct to take over the local companies drive our industry to either sell or become junior partners [47] In this sense, the liberalisation policy to allow multinationals to acquire 51 per cent share reinforces the tendency for trading among the Indian companies Such a situation suits the multinational corporations They not only get a ready market but reputed companies to market their goods in the country Such a tendency has far-reaching implications for the future industrial growth in the country

Negative Image of Labour The industry tends to look upon labour and labour laws merely as cost components bereft of anything else There is a lack of human angle in this respect They have a negative image of labour as uneducated unskilled, unmotivated for work tend, therefore, good for nothing [48] As a result, they tend to think of retrenchment as almost the first option for cutting costs, etc

Low Regard for Research and Development The R and D efforts in Indian industry have been very meagre There is hardly any R and D infrastructure in the private sector The country has only some R and D structure as sponsored by the government which also is now facing funds crunch There have been cases where the government has discouraged indigenously created superior technology by giving preference to foreign multinational corporations The industry is now being asked to compete without much infrastructure [49] For example, the R and D budget of one merican car manufacturer was more

than the entire turnover of Indian auto industry. What kind of competitive R and D facilities can be set up when the turnover of the entire Indian industry is less than R and D budget of one major international player.

The Indian industry has also not been anticipating technological change. It has shown low initiative in this regard. It has been more reactive and less pro-active. Research and technology development, however, need an initiatory process.[50]

Manipulative Rather than Competitive and Innovative: Ours has been a mixed economy where both, public and private sectors had important roles. (The NEP seeks to change this pattern in favour of private sector.) However, the private sector has been mostly negative of the public sector. Instead of co-operating with it in the interest of the country and for common cause, the private sector has tried to paint the public sector as only black and evil.[51] On the other hand, the private sector's own accountability for the investing public, customers, workers, society and even for the company itself has been rather low.[52] Such a negative attitude has prevented the industry to develop healthy competition for excellence. Instead, such attitudes have fuelled manipulativeness (and corruption) resulting in lack of proper achievement ethos in the country.

Low Pride in Indian Products: The dependence on foreign technology and charm of foreign goods is also reflected in the tendency to advertise and sell the Indian products in the name of foreign collaboration. For example, shaving blades are advertised for Swedish technology, shoes are advertised as made with Italian know-how or pressure-cookers with American technology. Such a tendency percolates to the market where the consumers also consider Indian goods as of poor quality unless these are manufactured with foreign collaboration and know-how. Foreign brand names, thus, gain additional prestige. As a result, there is a lack of pride for the Indian products with adverse socio-economic consequences for the country. This tendency is likely to be further strengthened in face of the financial and market power of the MNCs.

Need to Understand Tendencies: There is a need to understand the behavioural characteristics of industry, and to identify historical and structural antecedents which shape such behaviours. This is all the more important now when the industry is being deregulated and liberalised with primacy being given to the market forces. The moot question is whether the NEP would weaken the above tendencies or reinforce and further strengthen them. Such behavioural tendencies interacting with the macro-economic changes would have great bearing on work and the workplace with far-reaching social and political implications. Some of these are briefly discussed in the following section.

Liberalisation, Downsizing and Demoralisation

Competitive work organisations tend to release the energy of their members as long as they compete for creative work methods and innovative products. However, when they compete for making only quick profits, they create depressing, aggressive and hostile work climate between and within organisations. They tend to be driven by coercive practices without humane consideration. Macro-economic and organisational conditions during 1980s and early 1990s in the US and Great Britain provide interesting case studies in this connection from which we can learn a lot.

Rightsizing, 'Restructuring' and 'Downsizing' were the corporate slogans in the 1980s and 1990s in the US. "America has been driven by a single-minded mission to gut itself of 'excess workers'. It was supposed to be the fastest and easiest way to cut business cost, be more competitive and raise profits"... "There is mounting evidence that such a labour policy is back firing. Studies now show that a number of companies that trimmed their workforces not only failed to see a rebound in earnings but found their ability to compete eroded further".[53] Such companies were blaming their over-staffed workforce for bringing down profits. "But that's not the real problem" as reported by a research institute".[54] "These companies lost out competitively because they did not change their products". One of the obvious effects of downsizing was that the employees, who survived, were forced to work longer and harder. In February 1993, the manufacturing work week in the US stretched to 41.5 hours—the longest in 27 years. As Baumohl remarked "the resulting increase in stress leads to discontent, lowers creativity and undermines corporate loyalty".[55] A study by the American Management Association in 1992 showed, of more than 500 firms surveyed that had cut jobs since 1987, more than 75 per cent reported that employee morale had collapsed. Two-thirds of the companies showed no increase in efficiency at all and less than half saw any improvements in profits.[56] However, as a result of downsizing, solid middle class jobs have disappeared in record numbers and are being replaced by low wage jobs. Many of these jobs earn wages which are below the official poverty line.[57]

A commentator recently reported that "Britain this winter is sunk in doubt and debt, gloom and drift. A country beguiled not long ago by Margaret Thatcher's vision of an "enterprise culture seems to be a post-industrial Slough of Despond".[58] Some of the socio-psychological effects of the Thatcherite economic policy can be briefly summarised as follows: (i) The unemployment rate in 1993 was about 11 per cent with nearly three million people out of work. Several industries including banks and other business have shedded thousands of jobs. (ii) A depressing loss of idealism has invaded the society. The student rooms at universities of Oxford and Cambridge and London suburbs also have been hit by such loss of idealism. This has left Britons greatly aggrieved because they have long cherished such national institutions and a common culture. (iii) The permanently jobless youth have taken to crimes and vandalism. Some of them do not feel any pinch of conscience in stealing several times a day. (iv) The Thatcher government had overfuelled the boom phenomenon. In fact, it had corroded the society with 'grab-the-money ethic'. (v) Values of public good and common purpose have been greatly damaged by ideological attack on them during 1980s. This has resulted in a general moral decay. (vi) Gains of productivity in the British industry have been achieved largely by sacrificing jobs rather than by boosting output through innovative work.[59]

The general moral and social decay and the new ethic of grabbing money and making fast profit has affected the workplace. Public opinion surveys have revealed that nearly 50 per cent of the working Britons would like to emigrate as many of them apprehend that Britain would become a worse country to live in.[60]

Work and Political Participation—Then and Now

Years ago, Almond and Verba found that, "The belief in one's competence was a key political attitude. The self-confident citizen appear to be the democratic citizen. Not only does he think he can participate, he thinks others ought to participate as well".[61] They found 67 per cent of the American sample showing some sense of political efficacy. Two in every three US citizen, therefore, thought that they could influence national and local government decisions.[62] In this respect, they found participation at the local government level and "opportunities to participate in decisions at one's place of work" of crucial significance for development of sense of political efficacy. Such participation provides a training ground to foster a sense of competence, that, then, spreads to the national level. They further found, "the structure of authority at the workplace is probably the most significant and salient structure of that kind which the average man finds himself in daily contact".[63]

Some 30 years later, the Markle Commission found that the American citizen was now not a full and active participant in the electoral process.[64] Their findings created an apprehension about the American political system. They found that, "public indifference, lack of knowledge and political apathy are all time high".[65] The commission further stated that the election campaigns tended to trivialise the political process which strongly

contributed to conviction that "politics is a cynical unsavoury business".[66]

Consequences of downsizing and restructuring by cutting jobs as mentioned above and a large number of studies of workplace and industrial democracy obtaining in the US provide some answer to the weakening of political culture there.[67] A review of such studies some years ago found autonomy at the workplace as the key variable in work satisfaction. Reviewing more than 100 studies, the task force came to the conclusion that, "What workers want most is to become masters of their immediate environments and to feel that their work and they themselves are important—the twin ingredients of self-esteem".[68] Interestingly, such studies further revealed that, for the society, quality of jobs will be greatly beneficial in avoiding some of the large costs now being incurred. They are the cost of such job-related pathologies such as political alienation, violent aggression against others, alcoholism and drug abuse, mental depression and assortment of physical illness, inadequate performance in the school and a large number of welfare families than there need be.[69]

It was found that, "those workers with jobs that measure high on variety, autonomy and use of skills were found to be low on measures of political and personal alienation.[70] The best independent predictors of work alienation were: hierarchical work organisation with little discretion in pace and schedule; a blocked and chaotic career; and a stage in the life cycle that put "squeeze" on the worker.[71] They also found evidence of increasing dissatisfaction with jobs and increasing discontent among the middle managers, that tended to spread throughout the organisation.[72]

A striking evidence of work, political and personal alienation was provided recently by a survey of adult literacy in America. The survey showed that roughly 90 million Americans over age 16 years—almost half of the total population in this category—are, as far as most workplaces are concerned, basically unfit for employment. The worst news from the survey was when asked if they could read or write well, 71 per cent of those in the bottom grade said 'yes'. Most of them do not know that they do not know.[73] The survey clearly showed inadequate school performance, accumulated over years.

Thus, under the Impact of Reaganomics during 1980s and early 1990s, as mentioned above, the American work culture and social life were further dissipated, resulting in greater work as well as political alienation and apathy.

Socio-economic and cultural impact of growing unemployment and the tendency of industry to 'downsize', i e, retrench people and shed jobs, are common features in England and the US. One of the striking lessons for us in India is that shedding jobs does not help productivity. On the other hand, those who are left behind at the workplace get tense and demoralised. They lose their work commitment and become low-risk-taking and less innovative. Growing unemployment and social unrest release divisive, manipulative and immoral forces in the society which affect the social life including education and the workplace negatively. Thus, privatisation and liberalisation which the new economic policy is stressing as new 'mantras' may achieve just the opposite of 'competitiveness'. It may demoralise the society and seriously damage the very core of the cherished values of co-operation, sharing, savings, long-term perspective, challenge and risk-taking, creative problem solving and innovativeness which are essential for achieving competitive excellence.

VI
Policy of Self-Reliance: Challenge of Excellence at Workplace

Experience from other countries, including developed industrialised countries like the US and Great Britain, thus suggests that, liberalisation, deregulation and privatisation may release socially and morally disruptive forces in the country. These may promote grab-the-money ethic, driving people to seek personal interest by hook or by crook without caring for common cause. Unbridled consumerism being ruthlessly promoted by MNCs, on one hand, and unsatisfied needs on the other, could breed and accelerate crimes and create explosive social unrest. Under such a economic dispensation, social sector of education, health, skill formation, public sanitation, etc, are likely to get a setback. Such a scenario therefore would not be conducive to enriching the workplace and to enhancing the rate of human development in the country.

Competition for excellence and quality involves organisation, capability and concern for achievement. In other words, it largely depends on our own resources rather than borrowed money and imported technology. Such a competitive spirit requires readiness to take risk for achievement, initiative, sense of independence, sense of self-esteem, sense of vigilance and anticipation, readiness to give and take help, pride in one's own product and productive, social and personal action. Further, a democratic work-design is required to release and actualise such needs and potential at the workplace.[74]

The goal of national self-reliance and national pride have the potential for releasing strong motivation for excellence and for competing for quality and success at the workplace. We have plenty of such experience in the country where scientists, engineers and skilled manpower social activists and others have achieved great success in highly competitive situations.[75] This is best illustrated by achievements in the fields of nuclear energy and space application. For various commercial and political reasons, the country was denied access to foreign technology and know-how in these fields. This wa obviously done to prevent India from com peting with the advanced western countrie particularly the US. Our defence and nuclea scientists converted this situation into a chal lenge which released their innovativenes and creativity. They have been able to achiev remarkable success as indicated by launch ing of Prithvi and Agni. This technology wa developed with foresight, planning an organisational skills. The defence establish ment was transformed into an institute o higher performance and quality to functio with missionary zeal.[76]

Such competitiveness has to be develope on the basis of a sound organisational cultur of excellence, collaboration and co-opera tion, where there is readiness to invest energ and resources with long-term perspectiv and mission orientation. As discussed abov the new economic policy is not likely t release national pride and mission-orienta tion. On the contrary, it would create powe ful social contradictions and further wide and divide the society into handful of ric elites and large masses of poor people.

Technology May Fragment Work

In the US, technology is replacing skille labour for reasons like efficiency, compet tiveness, etc. As a result, workers are bein deskilled and labour is down graded.[77] This being done by a design in order to cut cost an achieve what has been described as 'jobles growth'.[78] Such use of hi-tech follows modern version of Taylorism[79] where wo is fragmented and workers are hired accor ing to the simple task. Such breaking up work demands low skills and workers g paid accordingly.[80] Technology is thus bein used to downgrade the quality of work and prevent workers from getting organise Workers thereby lose control to machin and systems and become powerless at th workplace. Such a manufacturing syste transforms the very concept of work and th nature of workplace, where there is a ve little scope for work, what to talk of creativi and competition, for the workers.

We have a long tradition of plural thinki in our cultural heritage. Globalisation a aggressive marketing of goods, services a communication seek to impose sameness taste, values and thinking.[81] This, in tu would impose unitary frame of referenc the workplace. Conflict of points of view a divergence of opinion help in promoti reflective intelligence among the member Thus, varying points of view play an imp tant functional role at the workplace fostering a culture of tolerance and criti examination.

The movement for restructuring the wo place for better quality of work life and provide greater job satisfaction would t be directly hit by the new economic poli Downsizing which is a very important cor late of privatisation would weaken self-e

cy, self-esteem sense of co operation and ncern for social achievement and excel ice among large body of workers Such a enario would, therefore downgrade phys il and mental health of the people both nong those who are likely to be retrenched d also among those who would survive at e workplace

Work is inextricably bound with human istence It is necessary for self-develop- ent as well as development of society ntent and context of work should there e promote rather than damage human dig- y Every human being has a right of access and use of resources of nature—common operty of humanity Historical experience nfirms the priority of labour over capital iich is acquired through work in order that nay serve work in future Workers there e have certain rights including the right to rk whose content and context including e superior-subordinate relationship, do not at employees as an 'instrument' of produc n but accord to them their due rights as mary efficient cause of production with e right and duty to take such initiative uch one would, if one were self-employed [83] State and industry have, thus, social re- onsibility to provide adequate work and oper work design and organisation There t need, therefore, to critically analyse NEP d the industrial policy to see whether such actices would promote productive haviour, higher job satisfaction, overall provement of work life and whether these consistent with the dignity of employees human beings and morality of work Blind d unconcerned implementation of the new licies, simply because some international nding agencies and multinational corpora- ns want it, could decelerate human devel- ment and play havoc with the workplace, lustry and the society as a whole

Notes

For some basic statistics see CMIE (1992)

For proposed reforms in banking and finan- cial system, see Government of India (1991) for reforms in insurance sector see Govern ment of India (1994)

The apprehended privatisation of banking and insurance sector has led to widespread discontent among the employees including officers and managers These issues have brought together all the major trade unions irrespective of their political affiliation to protest against a common cause privatisation of financial sector About 15 lakh employees are reported to have gone on one day strike on April 8, 1994 (*The Times of India* New Delhi April 6 and 9 1994)

For details see report on Economy and Employment A Growing Concern' *The Eco nomic Times*, New Delhi September 30 1991

For details see Satyanarayan (1992)

The United Nations Development Programme (UNDP) have been publishing Human Develop ment Reports and Human Development Index (HDI) for various countries in the world The HDI is based on life expectancy at birth adult literacy mean years of schooling educational attainment real GDP per capita and adjusted real GDP per capita India ranked 134 in 173 countries See UNDP (1993) also see UNDP (1990) and (1992)

7 UNDP (1993 21 22)

8 For example see Ganguli (1954) Veeraraghavan (1960) Lahiri (1965) Mehta (1978)

9 In a classical study Blauner found that the routinised automobile work environment and this assembly plant contributed little to the individual s self esteem The workers there showed cynical attitude towards authority and the institutional system The printing industry was however different See Blauner (1964 166 78) also see Gartman (1979) for the impact of assembly line and controls on skill and capability development of workers

10 There is a substantial body of research in behavioural science on the impact of such organisational factors on the individual See for example Argyris (1964, 1973) Mortimer (1979) Gecas and Seff (1987) and for review of related studies see Gecas (1989) for review of Indian studies, see Rao (1978)

11 For an important study of longevity see Palmore (1969) and for review of related studies see O Toole (1973 76 78)

12 Ibid 79

13 In a well known study Kornhauzhar (1965) found that 40 per cent of the 407 auto workers had some symptoms of mental health prob lem The key correlation was between mental health and job satisfaction Kornhauzhar's quotation is taken from O'Toole (1973 84) also see Schwalbe (1986) for psychological consequences of alienated labour

14 See Cole s classic paper on this subject (1913 65)

15 Many years ago UNESCO had sponsored a project on application of behavioural research to promoting participatory approaches and democratic management It was found that employers given to exploitative practices found it difficult to reconcile with democratisation at workplace See Likert and Hayes (1957)

16 For review of such social movements and collective efforts promoting the need for democratisation at workplace and a push for such democratisation during that period from youth in the US, see O'Toole (1973 43 50)

17 Government of India (1956)

18 For functioning of Joint Councils, see a report by Government of India, Labour Bureau (1975a)

19 This commission appointed by the govern ment of India reviewed the functioning of workers' participation in Indian industry (along with other issues on labour relations) See Government of India (1969)

20 Functioning of workers' participation in India has been critiqued from time to time at various national seminars Experience of non-func- tioning of various government schemes led to the introduction of Participation of Workers in Management Bill (No XXVIII) of 1990 in parliament This bill followed Article 43A of the Constitution making workers' participa tion as one of the directive principles of the state policy Article 43A reads as follows 43A Participation of Workers in Manage ment of Industries—The State shall take steps by suitable legislation or any other way to secure the participation of workers in man agement of undertakings establishments or other organisations engaged in any industry' For details of the Bill of 1990 and other related papers see NLLA (1990) Also of historical importance are other government schemes of workers' participation, see Government of India (1975 1977 1983)

21 Several studies are available on movement for quality of work life and work redesign in western countries For example see Herbst (1962) Blumberg (1968), Emery and Thorsrud (1970) Thorsrud (1972), Herbst (1974) O Toole (1975), NFTU LO (1975) Several Indian studies are also available See for ex ample Rice (1958) De (1984), Dayal (1977), Kanawati et al (1981) Some of these are discussed in Mehta (1992)

22 For review of such negative factors which tend to retard quality of life, see O'Toole (1973 94 97)

23 For increasing importance of social goals, other than economic goals in economic activities and at workplace, see EEC (1975), IRG (1981) It has been argued that 'human flourishing needs proper social conditions See Radin (1987)

24 Three dimensions of human development relate to capability, longevity and educational attainment Capability of acquiring knowledge and of participating in the life of community depends on access to resources needed for decent standard of living State interventions can make all the difference in accelerating the rate of human development irrespective of income status of community For discussion and data see UNDP (1993 9 20)

25 For discussion of such case studies involving people s self action for social achievement goals see Mehta (1994)

26 For review of such participatory projects enhancing dignity and status of labour in several poor communities, see Rehman (1987) Wiganaraja (1989)

27 Considerable experience exist in India where collective action on the part of the poor have helped them to acquire positive self image and actor role for themselves See Mehta (1983 1994)

28 For review of research on empowerment process at the work place, and for techniques of promoting such empowerment, see Conger and Kanungo (1989)

29 For discussion of the role of participation and empowerment in accelerating the rate of human development see UNDP (1993 21)

30 See Conger and Kanungo (1988) and Mehta (1994a)

31 For capability development, see Sen (1990) and for discussion of objective and subjective conditions in inculcation of sense of helpless ness and hopefulness, see Seligman (1975), Zimmerman (1990) and Wallerstein (1993)

32 For this success story, see Srinivas (1989) For review of some similar projects where work- ers have taken over sick plants, see report by Sriniwasan et al (1992)

33 For elaboration of the concepts of needs for social achievement and influence and for rel- evant findings, see Mehta (1994a)

34 For discussion of creativity in organisation, see Khandwalla (1984 30-32)

35 Friedmann (1992 70)

36 Bowen et al (1979 115)

37 For review of research on need for co-opera- tion and other related needs and their func tioning at the workplace, and for pathologies when structural conditions fail to meet such needs, see Turner (1988) Also see Mead (1934/1964) for his concept on 'social behaviourism' and Baldwin (1986) for dis- cussion of Mead's theory of co-operation

38 For discussion of ethical questions concerning alienation and empowerment at the work place see Kanungo (1992)

39 For discussion of issues concerning non-func- tioning of motivation theories at the work- place see Fitzgerald (1986)

40 For some empirical evidence of such self-perpetuating cycle, see a case study of coal industry in Mehta (1994a)

41 For discussion of issues concerning public interest as against private gain under capitalist economy, see Bell (1976).

42 For data on rising sickness in small-scale industry, see a report by Saxena (1991).

43 For discussion of case studies of industrial sickness as processed by BIFR, see Narayanan (1994). A study in 1979 revealed that mismanagement including diversion of funds accounted for 52 per cent of this malady while labour trouble accounted for only 2 per cent. See Herald Review (1985).

44 For discussion of such tendencies in Indian industry, see Vyasulu (1993). Sau notes in this connection (1994:938) that, "our corporate sector had demonstrated a profound fancy for speculation. Public sector enterprises have not lagged behind in this respect".

45 Entrepreneurship has been defined as a creative response and innovation. For discussion of such concepts, see Schumpeter (1947).

46 Psychological dimensions of entrepreneurship and need for achievement suggest that the real motive-force in development is the concern to improve and expand rather than the concern to make profits. The term profit suggests that the motive is tied with a particular economic system, i e, capitalism, whereas it operates as well in a communist or socialist state. For elaboration and discussion, see McClelland (1961); also see McClelland and Winter (1969:9-15).

47 For discussion of trading and moneylending background of big industrialists in India, see Chaudhary (1975:140-43).

48 For discussion of such negative images among the public sector managers, see Mehta (1977, 1994a) and for attitudes of private sector and approach of Federation of Indian Chambers of Commerce and Industry (FICCI) and Associated Chambers of Commerce and Industry of India (ASSOCHAM) toward labour, see news-analysis by Kingshuk Nag (1994). They think, without deployment of labour, productivity cannot be raised.

49 For discussion of how competitive indigenous state of art technology was undermined by seekers of imported technology and by state interventions in favour of import of technology as against fully competitive Indian technology, see Ram Chandran (1991).

50 For discussion of issues concerning technology development and R and D in India, see a report by Raote (1992). Competitive advantage requires firms working in related areas of technology and industrial culture that invests in R and D constantly, for discussion, see Porter (1990).

51 The private sector industry is desperate for privatisation of the public sector undertakings. They think without privatisation, units like steel and petroleum cannot be efficient. See Nag (1994). Such criticism and negative attitudes ignore the fact that Steel Authority of India (SAIL), Oil and Natural Gas Commission (ONGC) and National Thermal Power Corporation (NTPC) showed record profits and high efficiency during 1993-94. For reports see *The Times of India*, New Delhi, April 2, 6 and 8, 1994 respectively for performance of these companies.

52 See Narayanan *op cit*. The great security scam of 1991-92 reflected lack of accountability on the part of various sectors in the industry to the investing public and to their own companies, see various reports on securities, transactions of banks, other financial institutions [Reserve Bank of India 1993] and on irregularities in securities and banking transactions, see report of the Joint Parliamentary Committee [JPC 1993].

53 For downsizing in American firms, see, report by Baumohl (1993:46).

54 Remarks by Gerald Celente of the Trends Research Institute quoted in Baumohl (ibid:46)

55 Baumohl (ibid:46).

56 American Management Association Study (1992) quoted in Baumohl (ibid:46)

57 For unemployment scenario in the US and its social consequences, see Dembo and Morehouse (1992).

58 See a report by Walsh (1993:16) on worsening social-economic conditions in Britain.

Assessing Firms' Capabilities: Theory and Measurement

A Study of Indian Pharmaceutical Industry

Sumit K Majumdar

This paper has two objectives. First, the author describes an empirical approach to the assessment of intra-firm capabilities. Firms can acquire and configure resources. These are key building-blocks of firms' strategy as assumed in the emerging resource or capability-based view of strategic behaviour and performance analysis. However, the way resources are utilised are the principal causes of firms' success in attaining economic outcomes. While the process of resource utilisation is invisible, the use of data envelopment analysis (DEA) highlights firms' 'revealed' success in resource utilisation and co-ordination of activities, and DEA is described in detail. Second, empirical analyses of the capabilities and performance patterns of a group of firms in the Indian pharmaceutical industry are carried out.

I
Introduction

THE assessment of performance, and why firms might differ in performance, is one of the central issues in strategic management research. Performance differences arise because firms may have strategically positioned themselves in product markets, and are thus able to exploit the benefits of niche exploitation and high market share. By their choices as to which industries to participate in, which strategic groups to belong to, and what generic strategies to adopt [Porter 1980], firms can be protected by the barriers to entry and mobility that exist, and which define their strategic domains. This is the positioning view of strategy.

Concomitantly, firms are also conceptualised as bundles of key resources and capabilities, [Penrose 1959]. They possess heterogeneous skills which enable them to acquire, configure and utilise resources. Such skills give them idiosyncratic advantages which are often non-imitable. Such non-imitability arises because skills are not only firm specific and, therefore, idiosyncratic, but are also tacit. It is these tacit skills which raise barriers to imitation, and this is the primary argument from a competency or capabilities-based view of strategy.

There are three reasons to how idiosyncratic advantages can arise. Firms may have the ability to successfully acquire key resources by superior factor-market strategies, and then configure these resources into unique organisational forms [Prahalad and Hamel 1990]. However, the acquisition and configuration of resources, while not instantly imitable, is certainly imitable by other firms after a short lag. Then, strategic advantages arising out of such skills may be transient. Barriers to imitation arising out of such causes can afford only short-term protection. The key reason why firms may develop long-term successful barriers to imitation is because of their co-ordination capabilities.

The co-ordination capabilities firms possess is one of the central reasons why sustainable strategic performance differences arise among firms. However, co-ordination capability measurement is not an easy task. To understand if there truly are differences in co-ordination capabilities within firms is one of the first analytical tasks in contemporary strategic performance research. It is a first-order task; only thereafter can second-order explanations of why strategic performance differences exist among firms be attempted.

In this paper I illustrate the use of a recent technique called data envelopment analysis (DEA) which enables comparative co-ordination capability assessment to be carried out among a group of firms. Such analysis helps in understanding both the magnitude of strategic performance differences among firms, and why these differences arise. I use a sample of nine firms from the Indian pharmaceutical industry to empirically illustrate the technique, and I carry out two analyses. First, I compute the firm-level performance measure for these firms for the year 1990 only to illustrate the use of DEA. Second, I compute performance measures of these firms for four time periods: 1987, 1988, 1989 and 1990 to assess whether there are timewise differences in their capabilities.

II
Why Co-Ordination Capabilities Matter?

I briefly comment on why co-ordination capabilities matter to firms. Firms possess resources, material and intangible, which are utilised to undertake discrete activities, as Porter (1991) has suggested. Resource utilisation leads to their transformation in complex ways, which then creates value addition. The transformation takes place through linkages between various activities. How linkages between various activities are formed, how inter-dependencies are identified and exploited, and how these bring uniqueness and determinateness to a firm's operations is what co-ordination entails. Co-ordination is the principal intra-firm capability that generates successful outcomes, and it is the critical higher-order translation of lower-order routines, whereby activities are converted into major outcomes.

A key issue is, what is being co-ordinated? Firms are composed of bundles of resources. These resources are not only physical resources, but human resources which come together in a socially-complex way. The social-complexity of these resources arises because human beings own their labour and volunteer it towards firms' activities. Because human beings differ so widely in skills and abilities, there is cause-and-effect ambiguity in how socially-complex intangible resources, particularly human resources, interact with physical resources. The orchestration of this interaction process is what co-ordination entails. The components of the co-ordination process are invisible. Co-ordination, as orchestration of interaction between physical and human resources, thus exploits both technical and behavioural interdependencies.

Technical interdependencies are visible; physical linkages and conversion rates can be identified for a group of tangible assets. Human interdependencies are not visible, and the concatenation of technical plus human interdependencies requires the use of complex and invisible sets of routines. These higher-order routines enable activities to take place and firm-level outcomes to be generated. Thus, co-ordination is a key strategic process, but it is invisible. However, resource utilisation is a visible outcome, and the superiority of one firm's resource utilisation patterns enables us to evaluate whether its co-ordination capabilities are better or worse than its peers.

The argument I make is similar to the use of revealed preferences in the analysis of

consumers' utilities. A person's utility preferences can never be absolutely measured or known. However, from the choice of goods or services that she makes, we can indirectly infer what bundle of utilities she seeks to obtain. Prima facie, if a firm is successful at resource utilisation, it is better at the co-ordination of functional and strategic tasks and activities.

III
Data Envelopment Analysis

Data envelopment analysis (DEA) is a linear programming based technique that converts multiple output and input measures into a single comprehensive measure of firm-level performance. This is attained by the construction of an empirically-based production or resource conversion frontier, and by the identification of peer groups. The philosophy behind DEA is predicated by the fact that, in the theory of the firm I have based my conceptual arguments on, a frontier transformation function empirically captures the underlying processes defining firms' activities. Maximum possible output given inputs, or minimum inputs required given outputs, can be specified for production-oriented data. Other functions can be: a cost function describing the minimum cost of producing certain outputs, or a profit function, describing the maximum profit attainable, given outputs, input prices and technology.

A common feature of each function is optimality, whereby a minimum or maximum value attainable is calculated, and each function defines a frontier. The use of a frontier model can, first, define what performance levels are feasible for a set of firms making up an empirical population. Second, deviations from the frontier can be interpreted as a manifestation of inabilities to be managerially competent. Third, time-series information about the distance of each firm from the frontier over time yields insights about what is the rate and direction of change in its resource utilisation patterns. In other words, are its managerial or strategic co-ordination capabilities getting better, or worse, and by how much?

From a pragmatic perspective, DEA is an ideal tool in strategic performance analysis. An ideal or optimal strategic performance measure can never be specified, given the heterogeneity of prices, technologies and management capabilities. No one way of how best to do things can ever be specified, since there is causal ambiguity in how firms operate. However, with data on what firms have done, empirical functions can be derived based on what is actually attainable among a group of firms. Using the results, assessment of which are the seemingly managerially competent firms is possible. If firms differ, the quantum of such difference can be gauged, and data on 'revealed' co-ordinating capabilities among firms can be derived.

DEA Model and Definition

DEA is a performance measurement tool which is useful for uncovering patterns of dynamic performance. Using only observed output and input data for firms, the DEA algorithm calculates an ex-post measure of how efficient each observation was in converting inputs to outputs. This is accomplished by the construction of an empirically-based production frontier, and by evaluating each observation against others which are included in the data set. I do not do an extensive technical analysis of all the models feasible with DEA. While I do describe the DEA technique, the aim is to highlight the practical qualities. See Charnes, Cooper, Lewin and Seiford (1993) for codification of the various models possible, and the notation associated with each.

Dynamic performance patterns arise from changing production relationships over time, so that resource utilisation patterns show a rising trend. However, to empirically document the numerous changes in such relationships for the population of firms that can make up an industrial sector is a herculean task. In estimation of performance patterns, using algorithms that make no assumptions about the functional form of the production relationship or underlying technologies, other than convexity and piecewise linearity, the DEA programme factors in the impact that non-observable changes in production relationships have on observed efficiency patterns. If scores are rising over time, then it is prima facie, first-order, evidence that firms are responding to changing conditions and doing things better. While it is not easily empirically observable as to how things are being done differently, changing performance outcomes over time can point to changes taking place in intra-firm capabilities.

Following the classic work of Farrell (1957), two main paradigms have developed in the construction of performance frontiers, the parametric approach and the non-parametric approach. The advantage of the non-parametric approach is that no functional form needs to be imposed on the data and it can handle multiple outputs; however, frontier construction is sensitive to data contamination. The data need not be quantitative, and qualitative measures can be used as inputs or constraints. Concomitantly, real and physical values can be used at the same time as outputs or inputs, because the objective is not to estimate functional parameters but a relative measure of performance. Conversely, the parametric approach handles noise, but imposes an explicit and restrictive functional form for technology, and its use is restricted to the single output situation. See Bauer (1990) and Seiford and Thrall (1990) for descriptions of frontier estimation functions and DEA.

As developed by Charnes, Cooper and Rhodes (1978) [CCR], Farrell's output-input measure of performance is generalised to a multiple output-input case by means of a fractional mathematical programme, where the ratio of the weighted outputs to weighted inputs (an efficiency ratio) for each firm-level observation being evaluated is maximised. There are a total of n firm-level observations being evaluated. The data used for each observation j (where j are the observations: j=1, 2, ... k....n) are as follows: each observation consumes varying amounts of m different inputs to produce s different outputs. Specifically, observation j consumes $X_j = \{x_{ij}\}$ of inputs (i = 1,....m) and produces amounts $Y_j = \{y_{rj}\}$ of outputs (r = 1,....s). It is assumed that $x_{ij} > 0$ and $y_{rj} > 0$. The s x n matrix of output measures is denoted by Y and the m x n matrix of input measures is denoted by X.

For the k^{th} observation (among the j total observations) for which efficiency is being evaluated, the objective of the empirical exercise is to maximise the value of h_k which is the ratio of multiple outputs to multiple inputs, and the values of u and v; this function is expressed as:

$$h_k(u, v) = \sum_{r=1}^{s} u_r y_{rk} \Big/ \sum_{i=1}^{m} v_i x_{ik} \qquad (1)$$

In the above expression, h_k is a ratio measure of performance as to how efficient each observation was with regard to converting a set of inputs jointly and simultaneously into a set of outputs. For each k^{th} observation, y_{rk} are the multiple outputs which result from the conversion of x_{ik} inputs; u_r and v_i are weights which are calculated as values to be assigned to each output and input in order to maximise the efficiency rating, h_k, of the observation being evaluated.

The DEA procedure takes each observation's idiosyncrasies into account in the computation of its relative efficiency score. The set of weights (u_r, v_i) are implicit internal valuation schemes which are empirically determined by the algorithm, and may vary from observation to observation; for a firm which has multiple observations over time, they can vary over each period of time. This is based on a determination of which of the inputs a particular observation is particularly adept at in utilising, or which of the outputs it is particularly adept at in generating, based on data. By assigning high weights to those input and output variables which an observation seems to be more adept at in utilising, or in generating, and low weights to others, the algorithm attempts to

maximise the observed performance of each observation in light of its particular revealed capabilities. DEA may also be viewed as an extension of total factor productivity (TFP) calculations; it is as if each observation were to select the weights (i e, prices in a TFP calculation) that would present it in the best possible light, subject to the condition that the set of prices so selected does not give any other observation an efficiency ratio greater than unity.

Without any more constraints (1) is unbounded. Additional technological constraints are introduced with respect to every other firm-level observation to reflect the condition that the efficiency ratio be less than or equal to unity, or in other words, no observation can be super-efficient. The mathematical programming problem that results is:

$$\max h_k(u, v) = \sum_{r=1}^{s} u_r y_{rk} / \sum_{v=1}^{m} v_i x_{ik} \quad (2)$$

$$\text{subject to: } \sum_{r=1}^{s} u_r y_{rj} / \sum_{i=1}^{m} v_i x_{ij} \leq 1$$

$$(\text{for } j = 1, 2, \ldots 0, \ldots n) \quad (3)$$

$$u_r > 0 \quad (\text{for } r = 1, 2, \ldots s) \quad (4)$$

$$v_i > 0 \quad (\text{for } i = 1, 2, \ldots m) \quad (5)$$

The constraint in (3), therefore, ensures that the ratio measure of performance is not greater than one for any observation in the entire observation set, while the constraints in (4) and (5) are positivity constraints and are strictly greater than zero. (2) to (5) is a linear fractional programming problem, non-convex and difficult to solve. To do so, the fractional programme in (2) can be translated into a linear programme using the transformation developed in Charnes and Cooper (1962). Specifically, the transformation involves computation of two new variables:

$$\mu = \frac{u}{vx_k} \text{ and } \upsilon = \frac{v}{vx_k}$$

and to make the fractional programming problem a linear programming problem. The linear programming problem for the k[th] observation being evaluated now is:

$$\max w_k(\mu, \upsilon) = \sum_{r=1}^{s} \mu_r y_{rk} / \sum_{i=1}^{m} \upsilon_i x_{ik} \quad (6)$$

$$\text{subject to: } \sum_{i=1}^{m} \upsilon_i x_{ik} = 1 \quad (7)$$

$$\sum_{r=1}^{s} \mu_r y_{rj} - \sum_{i=1}^{m} \upsilon_i x_{ij} \leq 1 \; (j=1, 2, \ldots k, \ldots n) \quad (8)$$

$$\mu_r > 0 \; (r = 1, 2, \ldots s) \quad (9)$$

$$\upsilon_i > 0 \; (i = 1, 2, \ldots m) \quad (10)$$

In (6) now w_k is the objective function value for the observation being evaluated. In the LP in (6) the weighted sum of outputs that can be obtained is sought to be maximised, subject to the constraint that the weighted sum of inputs equals unity in (7). (8) is a constraint postulating that outputs cannot be less than inputs, and (9) and (10) are positivity constraints.

In (6), w_k is the objective function value which is the efficiency score to be calculated for the k[th] observation being evaluated. Each DEA model seeks to determine which subsets of the n observations determine parts of an envelopment surface. In the LP formulation the optimal value (optimal =*) of w_k^* is an efficiency indicator which measures the distance a particular firm-level observation lies from the frontier. The k[th] firm-level observation is efficient if $w_k^* = 1$ in (6). This observation is inefficient if it does not lie on the frontier or $w_k^* < 1$. The optimisation process in (6) is repeated n times, once for each firm-level observation for which efficiency is to be evaluated. In other words, the LP is solved with $(X_k, Y_k) = (X_j, Y_j)$ for $j = 1,2,\ldots k,. n$ Each time the optimisation is carried out data for other observations form part of the constraint set. The objective function values obtained partition the data-set into two parts: one consisting of efficient observations and the other consisting of observations which are inefficient and where $w_k^* < 1$.

Each firm that is rated as efficient is used to define an efficiency frontier, and firms not so efficient are evaluated by comparison with a hypothetical firm that is on the frontier, and which has the same output or input mix as the firm being compared. Then, the efficiency of the firm being compared is the ratio of the actual output levels to that of the hypothetical firm. One or several efficient firms having similar output or input mixes, and most similar in their operating characteristics relative to a firm being compared, can form the referent set and contribute in different percentages to the construction of the hypothetical firm against which a non-efficient firm is compared, A key assumption is that substitutability exists between any pair of inputs, and any pair of outputs, and the hypothetical firm's characteristics are realistically attainable. The use of significantly lumpy inputs, or where outputs are lumpy, can violate this assumption.

The choice of variables is also important, because the programme makes no a priori distinction between any two outputs or inputs. All variables that are in the programme have an equal opportunity to influence reported efficiency, and the definition and selection of variables to be included is important. However, DEA has one major attribute in that it places no restrictions on the functional form of the production relationships. The aim of optimisation is not to estimate structural parameters. The only assumptions made are that of piecewise linearity and convexity of the frontier, and that the underlying transformation model involves converting a set of inputs jointly and simultaneously into a set of outputs. Therefore, even attributes of the environment, or qualitative attributes of the production process can be included as input variables.

The efficiency of a firm does not decrease with the addition of a new variable to an already existing model; however, the proportion of firms that are rated as efficient will tend to increase, since there are more facets on which a given set of firms can now be efficient. A model with a large number of variables is one that may fail to have any discriminatory power between firms, because most firms will tend to be rated efficient. Hence, proper a priori choice of variables is vital in any DEA study.

For purposes of analysing managerial performance, the output of a DEA programme provides several aids. First, the relative efficiency measure gives an indication of how well each firm is performing relative to its potential. Since the best firms have to score 1, on a scale of 0 to 1, the difference in scores gives management policy-makers an idea of the scope of improvement possible, if any is required. Second, the identity of firms which form the referent set for a firm being evaluated gives an indication of which firms are closest to it in terms of operating characteristics. Further analyses can be based on following best practices of these referent firms. Third, the values of slack variables give an indication of the particular inputs that a non-efficient firm may have trouble conserving, or of the particular outputs that a firm may have trouble in augmenting. Thus, attention in subsequent follow-up analyses can focus on specific areas, rather than managerial resources being wasted in looking at all areas of a firm's operations including those which are non-critical.

Design of the data-set decides whether the optimisation in (6) to (10) is static or dynamic. All n observations can be taken for a particular year only. Thus, optimisation for the k[th] firm is done with respect to its cohorts for that particular year only. Information on several firms for several years can also be amalgamated to form a pooled cross-sectional time-series data set. In such a data set, when optimisation of each firm's score is carried out the comparator firm-level observations are those belonging to different time-periods, and there is comparison over time of the relative efficiency of each such firm. A comparison of relative efficiency characteristics for each of the j observations is carried out with respect to observations belonging to the same year as the compared observation, as well as with respect to those

observations belonging to different years. Therefore, within the DEA framework dynamic optimisation analysis can also be carried out.

The advantage of DEA lies in its approach. DEA is a methodology-oriented to frontiers rather than central tendencies. DEA optimizes for each individual firm-level observation, in place of overall aggregates and the single optimisation normally performed in statistical regressions [Seiford and Thrall 1990]. This attribute is particularly critical. In regressions where cross-sectional time-series data are pooled, the statistical package generates a single set of parameters for the entire data set. DEA, on the other hand, generates observationwise parameters; in dynamic analysis there is the certainty of knowledge that these parameters have been derived after a comparison of that observation with respect to observations which belong to other time-periods. Hence, inferences of dynamic efficiency patterns are feasible.

In extending the CCR model, Banker, Charnes and Cooper (1984) [BCC] show that the CCR efficiency score can be broken up into a measure of scale efficiency, and another for pure technical, or managerial efficiency given the scale of operations each observation is presently at. This is achieved by assuming that variable returns to scale exist for firms, and adding a variable k in the objective function in (6). The result of adding this variable is that hyperplanes for each observation do not pass through the origin, unlike in the CCR model where all hyperplanes go through the origin because constant returns to scale are assumed. In the constraint set, this variable is unconstrained in that it can take on values which are either negative (increasing returns to scale may exist), or 0 (constant returns to scale may exist) or positive (decreasing returns to scale may exist) for each k^{th} observation.

Empirical Analyses of the Indian Pharmaceutical Industry

I use data for a set of nine firms for the year 1990 to illustrate how DEA is useful as a tool for assessment of intra-firm co-ordination capabilities. Thereafter, I use data for these firms for three earlier years: 1987, 1988 and 1989. In conjunction with cross-sectional data analysis carried out for the year 1990, DEA is also shown to be useful in analysing dynamic strategic performance trends.

The choice of outputs and inputs is critical in any DEA based study. Prior work in the study of schools [Sengupta and Sfeir 1988] has used as output the achievement score of 6th grade pupils, while inputs were average teacher salary, proportion of Anglo-American pupils, average class size and parental socio-economic background. A study of steam-electricity generating plants [Banker 1984] has used net generation and peak demand as outputs, while inputs used were plant costs, labour and related costs, and fuel consumption. Recently, DEA has also been used to make a comprehensive assessment of the impact of market liberalisation on firm performance in the US telecommunications industry [Majumdar 1994]. Two basic models were estimated. In one of the input-conserving (cost-minimising) model outputs were total number of local calls and total number of toll calls; the inputs were maintenance and depreciation expenses, traffic, commercial and general office expenses, and other expenses. In one output-augmentation (revenue-maximising) model, the outputs were: total local revenue, total toll revenues, and total access and other revenue, while the inputs were: the total number of switches, total number of access lines, and the total number of employees.

DEA is a technique which allows for flexibility in use of data; by that token it is also extremely sensitive to data contamination and outliers. In this study, I use as output: the value added by operations of each firm. The inputs I use are: gross fixed capital, net working capital and the total number of employees in each firm. The data are derived from a Centre for Monitoring the Indian Economy (CMIE) publication titled *Data on Large Business Units* published in July 1992. Other firms in the Indian pharmaceutical industry did not report all data fully. I use the BCC method of estimation, since the performance score yielded by that algorithm is a pure measure of latent co-ordination capabilities in firms, irrespective of whether scale economies exist or not. I estimate input-oriented models of performance, since the knowledge of how much input slack there is can be a significant factor in strategic decision-making, and what facets of firms' operations need greater co-ordination.

The nine firms chosen are: E Merck and Company India, a private sector firm which is the subsidiary of a Germany-based drug multinational; Bengal Chemical and Pharmaceutical Works, and Bengal Immunity Company, both of which were erstwhile private sector firms established early this century as the first pharmaceutical manufacturers in India using Indian business expertise and technological know-how, but were taken over by the central government when they ran into severe difficulties; Hindustan Antibiotics, the first major bulk-drug manufacturing firm set up in the public sector, with assistance from the UN, to manufacture penicillin and other primary bulk drugs; Indian Drugs and Pharmaceuticals (IDPL), the second major public sector enterprise to be set up; Smith Stanistreet another former private sector firm which failed and was taken over by the government; Rajasthan Drugs and Pharmaceuticals, a public sector (state-owned) firm jointly promoted by the state government of Rajasthan and IDPL; Sandoz India, a private sector firm, and a subsidiary of one of the world's largest drug multinationals; and UP Drugs and Pharmaceuticals, a public sector firm jointly promoted by the state government of UP and IDPL. There is a wide variety of firms represented in the sample, and data on inputs and outputs for the year 1990 are given in Table 1. There is wide heterogeneity in origins, size, ownership patterns and presumed capabilities, but all these firms are in the same line of business.

Table 2. Performance Scores for 1990—Input Conserving Model

Firm studied	Performance Score
E Merck and Company India	0.8838
Bengal Chemicals and Pharmaceutical Works	0 5430
Bengal Immunity Company	0.7461
Hindustan Antibiotics	0.6855
Indian Drugs and Pharmaceuticals	1.0000
Smith Stanistreet	0.5429
Rajasthan Drugs and Pharmaceuticals	1.0000
Sandoz India	1.0000
UP Drugs and Pharmaceuticals	0.6994

Table 1: Actual Inputs and Outputs—Sample of Firms for 1990

Firm	Inputs			Output
	Fixed Capital (Rs crore)	Working Capital (Rs crore)	Employees (Number)	Value Added (Rs crore)
E Merck and Company India	38.11	48.08	1854	18.10
Bengal Chemicals and Pharmaceutical Works	9.72	12.37	1752	2.16
Bengal Immunity Company	6.84	8.04	1688	1.84
Hindustan Antibiotics	62.69	93.91	2634	27.85
Indian Drugs and Pharmaceuticals	152.09	164 38	12256	41.15
Smith Stanistreet	3.54	7.99	1020	1.10
Rajasthan Drugs and Pharmaceuticals	1.22	3.35	140	0.66
Sandoz India	48.84	80.11	2055	-34.86
UP Drugs and Pharmaceuticals	1.84	4.79	358	0.38

IV
Results from Cross-Sectional DEA Analysis

I first undertake a cross-sectional analysis of the performance of the nine firms for the year 1990. The results of the firm-level performance analyses are given in Table 2.

Of the nine firms evaluated in 1990, there are three best performers which define the frontier with a score of 1. They are Indian Drugs and Pharmaceuticals, Rajasthan Drugs and Pharmaceuticals, and Sandoz India. Each firm is of a different size; Indian Drugs and Pharmaceuticals is the largest, while Sandoz is medium sized and Rajasthan Drugs and Pharmaceuticals is tiny, relatively speaking. The BCC procedure which captures pure managerial efficiency, irrespective of scale consideration, has been used, and a widely divergent variety of firms in size are shown to be the most competent.

Among the seven non-efficient firms, the worst performers are Bengal Chemical and Pharmaceutical Works, and Smith Stanistreet. Both are turn-of-the-century firms, which were taken over by the government in the late 1970s and early 1980s, under the Industries Development and Regulation Act of 1951, for mismanagement. Their relative performance shows them still to be the worst in performance. The other public sector firms are not superior performers either In increasing score-order are. Hindustan Antibiotics, UP Drugs and Pharmaceuticals, and Bengal Immunity Company How incentives in government owned firms are structured seems very critical to the way latent capabilities are co-ordinated and resources utilised. Public sector ownership, on the whole, generates slack and inefficiency as the data, prima facie, reveal. Conversely, while E Merck, a private sector firm, is not a superior performer, its score of .884 places it, at least, at the top of the non-efficient firms' category.

Reference Set Analysis

In the linear programming formulation, the efficient firms form a referent set for calculating the performance scores of the non-efficient firms. For each firm which is a non-optimal performer, one or more firms similar in operational capabilities are identified, and the actual proportion by which each such optimal or efficient firm influences one which is non-optimal is given. Results related to this aspect for the non-optimal firms are given in Table 3

For E Merck the referent set firms are Rajasthan Drugs and Sandoz Both almost equally influence E Merck's performance score. E Merck and Company manufactures both prescription and over-the-counter products. Its activities and abilities are broadly similar to both firms in its referent set: that of Rajasthan Drugs' prescription drug orientation and the non-prescription skills of Sandoz. Bengal Chemical and Bengal Immunity are both smaller scale public sector units (volume manufacturers of key bulk drugs as well as prescription drugs). Hence, it is not surprising that Rajasthan Drugs, which is a smaller, but optimal, public sector firm, is the closest in capabilities to these firms. Hindustan Antibiotics is a public sector firm; hence, there are similarities in its operational capabilities with Rajasthan Drugs and Pharmaceuticals. However, it is a large organisation, making bulk drugs and using high-technology, and there is a much closer affinity to the operations of Sandoz. Sandoz, therefore, primarily makes up its referent set.

Of the other firms, each of the best, or efficient, firms have only themselves as fully dominating their referent sets. The empirical procedures also yield data which suggest that there are other firms similar to themselves; however, the influence of those firms on the efficient firms will be zero. For example, in the case of Indian Drugs and Pharmaceuticals it is a best performer; thus, in its referent set it is compared 100 per cent to itself. However, Sandoz is also similar to IDPL in its operational capabilities to it, given the activities Sandoz undertakes. Therefore, both IDPL and Sandoz form the referent set for IDPL However, given IDPL is efficient (score=1), the proportion influenced by Sandoz is zero. Nevertheless, the performance of Sandoz provides a useful benchmark for future performance evaluation of IDPL. For the other non-efficient firms in the data-set, Rajasthan Drugs is the primary referent firm. It is a small public sector unit and its operations are, therefore, most similar to those of Smith Stanistreet and UP Drugs and Pharmaceuticals.

Input Slack Analysis

Solution of the input conserving DEA programme also yields details of the maximum amount of inputs any non-optimal firm is to use, if it is to be as efficient as the others in its referent set. The optimal firms, of course, have no input slack. Details of the input slack are given in Table 4. The target input is what the firm in question ought to have consumed if it was to be rated efficient. The slack is the actual input consumed minus the target input a firm ought to have consumed

As is evidenced, the best firms, Indian Drugs and Pharmaceuticals, Rajasthan Drugs and Pharmaceuticals and Sandoz have input slack of zero E Merck is the better firm among the non-optimal performers, and its slack is relatively the least. While it does use excess plant and equipment (see the slack in gross fixed capital), its use of working capital is relatively better than the use of its fixed capital Hence, its co-ordination of current day-to-day operations seems more competent than management of its long-term operations, pharmaceutical industry operations need significant quantities of deferred (long-term) expenditures, for example, in R and D activities, and this is one area where E Merck, with its ostensibly superior foreign capabilities, can pay more attention to

If the worst firms, Bengal Chemical and Pharmaceutical Works or Smith Stanistreet are assessed next, large quantities of slack are shown to exist in resource utilisation. Not only can both firms halve their inputs of physical and working capital and attain the

Table 3 Referent Sets for Individual Firms, 1990

Firm Studied	Influential firm	Proportion Influenced
E Merck and Company India	Rajasthan Drugs	49
	Sandoz	51
Bengal Chemical and Pharmaceutical Works	Rajasthan Drugs	96
	Sandoz	04
Bengal Immunity Company	Rajasthan Drugs	97
	Sandoz	03
Hindustan Antibiotics	Rajasthan Drugs	20
	Sandoz	80
Indian Drugs and Pharmaceuticals	IDPL	1 00
	Sandoz	.00
Smith Stanistreet	Rajasthan Drugs	99
	Sandoz	01
Rajasthan Drugs and Pharmaceuticals	Rajasthan Drugs	1 00
	Sandoz	00
Sandoz India	IDPL	00
	Sandoz	1 00
UP Drugs and Pharmaceuticals	Rajasthan Drugs	1 00

same value added if their managerial capabilities are up to par, but there is maximum slack in the utilisation of employees. Overmanning is significant. Admittedly, this is a well known fact about many public enterprises. But the specific quantum of overmanning has been estimated. Bengal Chemicals can reduce almost 1,500 employees and not feel the pinch; Smith Stanistreet can reduce over 850 members of its workforce and attain the same output. These reductions are over 80 per cent of the work-force for each firm. Losing such a large number of employees will not in any way impair output, and can improve efficiency of these firms.

A bird's-eye view analysis of Table 4 shows that among all the non-efficient firms there is significant slack in how human capital is utilised. Clearly, if co-ordination capabilities were enhanced, and better quality effort extracted from employees towards enhancing outputs, significantly better results would ensue. Of the seven non-optimal firms, at least four of these: Bengal Chemical and Pharmaceutical Works, Bengal Immunity Company, Smith Stanistreet and UP Drugs and Pharmaceuticals have huge surpluses in human capital. While the evidenee is not surprising, what is worrying is the quantum of the surplus. The surplus in each case is more than double the number required for each firm to be as efficient as their compatriots. The employee surplus percentages are 451 per cent, 719 per cent, 521 per cent and 156 per cent of the optimal numbers needed in each firm respectively. Recollect also that for these four firms, the primary referent firm (Table 3) is Rajasthan Drugs and Pharmaceuticals, a public sector firm. Hence, it is not as if these firms are being compared with the larger branches of multinational firms operating in India, which may possess different behavioural predilections. The four firms are compared with their public sector sibling, where similar behavioural predilections can be expected to exist.

Continuing the bird's-eye view analysis further, it seems that all the nine pharmaceutical firms studied are more adept in co-ordinating day-to-day business activities which involve the use of working capital. These activities include operations such as sales and receivables management, distribution and stock management, and supplier management which also includes the management of payables. Conversely, production and development activities, involving the use of fixed and long-term oriented capital stock, are less successfully managed. The primary evidence to support such an assertion is in Table 4, where estimates for the relative proportion of slack to actual input of both gross fixed capital and net working capital are provided. Among the inefficient firms, in each and every case the lowest percentage of slack to actual input usage is in working capital. As regards the percentage of slack in use of physical capital, E Merck has the least percentage of such slack, while the other firms are quite profligate with the use of their capital resources.

Performance Analysis over Time

While DEA is useful for a cross-sectional assessment of co-ordination capabilities, it is equally useful for the assessment of dynamie performance changes. I use DEA to undertake such an assessment, for the nine firms for four years: 1987, 1988, 1989 and 1990. The aim is to uncover the changing patterns of performance for each firm. Results are given in Table 5.

Of the three firms that made up the referent set for the year 1990 in this analysis, only two are actually efficient in 1990 as the dynamic analysis shows. Remember now that we have data for all four years in the optimisation programme. Hence, the non-optimal firm for 1990 in this analysis, Rajasthan Drugs, is being compared against all firms in all years for the primary estimation. Of the three efficient firms in 1990, Indian Drugs and Pharmaceuticals was a gross non-performer in 1987, but in each succeeding year has improved its performance till in 1990 it was a frontier-defining firm. Rajasthan Drugs started out as a frontier-definer in 1987 and 1988, but its performance slipped a bit in 1989 and 1990. Sandoz was, on the other hand, a significant non-performer in 1987 and 1988, compared to its frontier-defining status for both 1989 and 1990.

Among the other firms which are non-efficient, the pattern of performance as revealed by the data is equally interesting.

Table 4: Target Inputs and Slack in Input Usage Among Inefficient Firms, 1990

Firm	Inputs	Fixed Capital	Working Capital	Employees
E Merck and Company India	Target	25.50	42 49	1116.54
	Slack	12 61	5.59	737.46
	Percentage of Slack to Target	49.55	13.16	66 05
Bengal Chemicals and Pharmaceutical Works	Target	3.31	6.72	323.99
	Slack	6.41	5.65	1464.01
	Percentage of Slack to Target	193.66	84.08	451.87
Bengal Immunity Company	Target	2.86	6.00	206.07
	Slack	3.98	2.64	1481.93
	Percentage of Slack to Target	139.16	44.00	719.14
Hindustan Antibiotics	Target	39.08	64.38	1662.48
	Slack	23.61	29.53	971.52
	Percentage of Slack to Target	60.41	45 87	58.48
Indian Drugs and Pharmaceuticals	Target	152.09	164.38	12256.00
	Slack	0 00	0.00	0.00
Smith Stanistreet	Target	1.83	4.34	164.64
	Slack	1.71	3.65	855.36
	Percentage of Slack to Target	93.44	84.10	519.54
Rajasthan Drugs and Pharmaceuticals	Target	1.22	3.35	140.00
	Slack	0.00	0.00	0.00
Sandoz India	Target	48.84	80.11	2053.00
	Slack	0.00	0.00	0.00
UP Drugs and Pharmaceuticals	Target	1.22	3.35	140.00
	Slack	0.62	1.44	218.00
	Percentage of Slack to Target	50.82	42.99	155.71

Table 5: Performance Score Trends Over Time

Firm	Performance Score			
	1987	1988	1989	1990
E Merck and Company India	.996	1.000	.886	.819
Bengal Chemicals and Pharmaceutical Works	.191	.186	.287	.363
Bengal Immunity Company	.603	.501	.411	.484
Hindustan Antibiotics	.788	.850	.855	.675
Indian Drugs and Pharmaceuticals	.098	.672	.789	1.000
Smith Stanistreet	.874	.704	.582	.409
Rajasthan Drugs and Pharmaceuticals	1.000	1.000	.966	.971
Sandoz India	.789	.770	1.000	1.000
UP Drugs and Pharmaceuticals	1.000	.626	.652	.603

E Merck was a highly efficient firm, almost a frontier-definer in 1987 and a frontier-definer in 1988, but slipped in its performance in 1989 and 1990. Such trends can be a warning signal to management to start paying attention to the way business is being currently managed. Bengal Chemical's performance is the worst of all firms in this four-year analysis, but it shows a rising trend in its performance score over the period 1987 to 1990. Take-over by the government may have revived its flagging performance.

However, similar comments cannot be made about the performance trends of Bengal Immunity and Smith Stanistreet. Between 1987 and 1990, the performance of both slipped, if not so precipitously for Bengal Immunity, precipitously enough for Smith Stanistreet as to call into question its continuation as an economic entity. Though such performance trends may be thought of as aberrations, questions as to the continued ability of these firms to survive can be raised when slack in resource utilisation, as earlier analysed, is also considered.

Finally, the performance of the two other companies studied bear commentary. Hindustan Antibiotics, as the leading large public sector unit, was set up to make bulk drugs and products for which private sector investment would not be forthcoming. It is not in the primary business of making and selling consumer-oriented products. There are public-good considerations involved in the operations of Hindustan Antibiotics. While its performance has never been stellar, it has been a reasonably adequate performer, with scores of .788 in 1987, .850 in 1988 and .855 in 1989. However, there has been a marked decline in its performance in the period to 1990. Similarly, UP Drugs was a frontier definer in 1987, but its performance slipped badly in 1988, and has stayed at almost the same levels thereafter.

Clearly, these are signals for firms' management that major slip-ups have occurred over time. There may be exogenous factors such as government-imposed price controls which keep revenue streams from growing while costs keep on increasing. Nevertheless, a comparison with firms in similar circumstances, such as Indian Drugs and Pharmaceuticals and Rajasthan Drugs and Pharmaceuticals which are currently doing well, may reveal the existence of lacunae in the way Hindustan Antibiotics and UP Drugs and Pharmaceuticals have recently been managed.

V
Conclusion

In this paper I have shown how intra-firm strategic performance assessment can be carried out using the data envelopment analysis. Firms are repertoires of resources, skills and capabilities, and it is their prowess and uniqueness in co-ordinating resources and capabilities which yields first-order strategic advantage. DEA enables the existence of such co-ordination capabilities to be revealed. I empirically demonstrate co-ordination capability assessment for a group of nine firms in the Indian Pharmaceutical industry both on a cross-sectional basis, and over a four-year period of time.

Given the context of the firms, which is the Indian pharmaceutical industry, DEA procedures have revealed that public sector firms are poor performers compared to their private sector counterparts. Admittedly, there are many impression-based writings which have hypothesised why public sector firms may be poor performers. However, the precise extent to which performance is poor can be assessed using DEA. Since DEA yields first-order performance data, further research is possible using several other explanatory variables for second-order analyses. In the case of the pharmaceutical firms, such second-order explanatory variables that I have used are not quantitative. Rather the explanations are based on brief assessments of the history of each of these firms. The firms which have turned out to be very poor performers are those which were taken over by the government for mismanagement.

However, not all public sector firms are poor performers. IDPL, after an initial bad spell in 1987, showed that it could turn the corner quite effectively and by 1990 was a frontier-defining firm. While this study is constrained by lack of adequate private sector firm data, of the two such firms studied one, E Merck, is not a frontier-defining firm, while the other, Sandoz, is such a firm. Even among private sector firms significant performance differences arise, though both ostensibly have access to superior technological capabilities of their parents.

Finally, the use of DEA reveals the specific areas of operations in which firms are able to utilise their resources better. The pharmaceutical firms seem more adept at day-to-day transactions management. Their working capital management skills seem intrinsically superior, compared to skills in utilising physical assets. Though complex production capabilities, and the propensities to use research-based high-technology items, are conducive to success in this industry, the firms studied do not seem to possess skills in these areas. Similarly, there are shortfalls in utilising human capital. Admittedly, the large employee numbers can be due to historical causes. Nevertheless, it is one resource many firms can shed without any detriment to output. Conversely, if all employees can be fully utilised, then there can be substantial augmentation of output for these firms.

Merchant Banking under SEBI Guidelines

Sankar De
Sushil Khanna

This paper examines the economic and financial implications of some of the regulations introduced by the new Securities and Exchange Board of India (SEBI) through the guidelines it has periodically issued. The regulations apply to investment or merchant banking services required for corporate issues of long-term securities in India. The authors find that some implications of the guidelines may be in conflict with the professed objective of the current economic policy to induce the corporate sector to raise external funds from private investors. Further, the guidelines may be self-defeating in that they may result in less, *rather than more, information for the investing public about the typically unobservable quality of a new issue.*

Introduction

THE Securities and Exchange Board of India (SEBI), established as an administrative body in April 1988, became a statutory body in January 1992. The transformation was formalised by an Act of the Indian parliament in April 1992. The Act charged the SEBI, the first national regulatory body in India with comprehensive statutory powers over practically all aspects of capital market operations, "to protect the interests of the investors and to promote the development of, and to regulate, the securities markets by such measures as it thinks fit".[1]

To see the significance of the above charges, one has to take note of two major developments in Indian capital markets in recent years, one on the side of supply and the other on the side of demand. The last decade has witnessed a tremendous growth in the markets, aided in more recent years by the new economic policy of liberalisation introduced by the Indian government. On the other hand, the same economic policy, incorporating gradual introduction of free market principles, has created an unprecedented demand for private risk capital in industry and commerce. Traditionally, the Indian corporate sector has relied excessively on certain special financial institutions owned and/or controlled by the government for its long-term capital needs. While the institutions, which include Industrial Development Bank of India (IDBI), Industrial Finance Corporation of India (IFCI), Industrial Credit and Investment Corporation of India (ICICI), and a number of other national and state-level agencies, often provided funds to the private sector corporations on concessional terms, they themselves received in turn considerable concessional finance from the Reserve Bank of India.[2] To break this circle of subsidised financing, the new economic policy encourages the corporations to raise resources increasingly from private investors.[3] In this context, the promotion and development of the capital markets as well as facilitation of public participation in those markets by ensuring orderly disclosure of information about the borrowing corporations and other forms of investor protection were naturally recognised as two very important goals for the national regulatory body.

In this study, we examine the economic and financial implications of some of the regulations introduced by the SEBI, through the guidelines it has periodically issued, in execution of its responsibilities. The regulations in question apply to investment or merchant banking services required for corporate issues of long-term securities in India. It has been suggested in the financial press that the SEBI guidelines are in the process of making the current investment banking scenario in India fundamentally different from the past. In our analysis, we are concerned with determining whether the changes being effected by the regulations are consistent with the twin goals of capital market development and investor protection.

We proceed as follows. In Section II of this paper, we place the subject of the present study in its context and discuss certain institutional features of merchant banking relating to issues of long-term corporate securities. In the process, we draw attention to some merchant banking practices which differ between the US and India. In Section III, we discuss the implications of the choice of merchant banking services by the issuing corporations in the context of existing models proposed by De and Nabar (1991b, 1992). The models recognise the fact that the new issues markets are typically prone, perhaps more so in developing capital markets such as in India, to problems of asymmetric information between the issuing corporations and the investing public. As a result, the process of certification of prospective issues by merchant bankers, an aspect of merchant banking which in actual practice is very important for the regulatory authorities, plays a central role in the models. In Section IV, we examine the provisions of the SEBI guidelines in question in terms of the implications of the models. We find that some possible implications of the guidelines may be in conflict with the professed objective of the current economic policy of the Indian government to induce the corporate sector to raise external funds from private investors. More seriously, we find that the guidelines may be self-defeating in the sense that they may result in less, rather than more, information for the investing public about the typically unobservable quality of a new issue. In Section V, we present our recommendations and conclusions.

Several aspects of the study merit attention. The efficacy of government interventions has been studied extensively, in general terms as well as in the specific context of the historical experience of various countries, in certain other spheres, most notably in foreign trade but, to the best of our knowledge, not in capital markets under asymmetric information. It is hoped that in this respect the present study will add useful insights to the ongoing debate between government interventionists and proponents of market forces. We hope, further, that the study has useful observations to offer on the development and promotion of capital markets in India and in other countries similarly situated. In particular, we make the observation that promotion of capital market efficiency and enhancement of investor protection are often compatible and not conflicting goals. This is surely the case when capital market efficiency consists in reduction of asymmetric information between the issuing corporations and the investing public. Usually, the latter are better protected as they are more informed. This insight plays a major role in our recommendations.

II
Offering Methods

In raising capital with long-term securities, public corporations have the choice of broadly three methods of offering them for sale: public issues, rights issues, and private placements. In the first method, which has been by far the most important mode of raising long-term capital in the US and more important than the other two methods also in India,[4] the management of the issuing corporation offers the new issue to the investing public in general. The process involved is usually elaborate and often complex. As a result, the issuing corporation hires one or more merchant banking companies to manage the issue, including its origination, marketing, and distribution.

A very important part of the process of origination is the investigation and certification of the new issue provided by the merchant banker (usually by the lead merchant banker in case more than one banker are involved). Typically, the merchant banker is required to verify the content of the issue prospectus released by the issuing corporation and to exercise 'due diligence' in the process.

In the US courts of law, due diligence has been interpreted as the kind of diligence which a reasonable person will bring to bear on his personal financial matters. Normally, s require the merchant banker to furnish a due diligence certificate before they grant their approval to the issue. In India, provision of this certificate by lead merchant bankers involved in an issue is mandatory under the new guidelines for merchant banking activities.[5] In fact, the SEBI has prescribed a standard format for this certificate. The format, which has been revised several times, has been effective in its present version since January 1, 1992.

Even when no explicit certificate is either required or furnished, the certification implicit in an offering managed by an investment banker may be important. The quality of the new issue, which is often not evident to the investing public, may appear to be certified or vetted by the merchant banker concerned who is perceived to back it with his reputation. The quality certification aspect of the investment banking process has been noted in general terms as well as in the context of the US capital markets [Baron 1982; Beatty and Ritter; Booth and Smith 1986; De and Nabar 1991a, 1991b, 1992; Hansen 1986; and Rock 1986].

In trying to market the new issue, the merchant banker performs a number of different functions, including selection of advertisements, bankers, collection centres, and brokers. None of them, however, compares in importance with the task of securing underwriting arrangements for the issue. Under a typical underwriting arrangement in India, the underwriter (or a consortium of underwriters if the issue is sizeable, which may include, in addition to the merchant bankers themselves,[6] public financial institutions and approved commercial banks, insurance companies, and stockbrokers) undertakes to accept a specified number of shares in the event the public do not subscribe to them. The number of shares, thus underwritten, constitutes his accepted devolvement.[7]

Typically, the responsibilities of the merchant banker extend to the distribution of the new issue. In India, the distribution-related responsibilities of the merchant banker, including allotment of securities to the investors and timely refunds, have been formalised and incorporated in the new guidelines for merchant bankers. The guidelines clearly state that "the involvement of merchant bankers in an issue should continue at least until the completion of the essential steps".[8] In all, the responsibilities of merchant bankers under the new guidelines in force in India extend all the way from verification of material facts disclosed in the prospectus for the new issue under their management to the completion of all the issue formalities, including timely despatch of securities/refunds.

Under the second method of issuing long-term securities, namely, a rights issue, the corporation offers the new common stock directly to its current shareholders. To start with, each shareholder is given a 'right' to subscribe to a *pro rata* amount of the new offering at a fixed subscription price over a specified, usually short, subscription period. The shareholder has the option to exercise his subscription rights himself or sell the rights to others.[9]

How do the two methods, public issue and rights issue, compare with each other? The two relevant criteria in this connection are, as in any issue of this nature, relative benefits and costs of the two methods. On the side of benefits, a public issue carries with it the merchant banker's certification. On the other hand, a rights issue, being sold directly to the existing shareholders of the corporation, does not need to be managed by a merchant banker, in which case it is not screened for quality either (though in India the SEBI has made management by a lead merchant banker mandatory for a rights issue exceeding a certain size; more on this point in Section IV of this article below). However, there are costs to merchant banking services, and they can be significant. In India, the existing government regulations permit total merchant banking fees for an issue to go up to 0.5 per cent of the first Rs 25 crore of the issue proceeds and to 0.2 per cent of any additional amount.

A significant benefit to be considered in this connection is the degree of effectiveness with which either method ensures that the issue is successful in raising the target amount of capital. A public issue with full underwriting, of course, carries a guarantee of total success. This guarantee is absolute unless the underwriters involved in the issue default on their accepted devolvement. However, the underwriters provide this guarantee for a usually substantial commission. In India, under the current government regulations the ceiling rate for underwriting commission is 2.5 per cent of the underwriter's commitments. This amount, comparable to an insurance premium, is payable regardless of the number of shares eventually taken up by the underwriter. In addition, brokers to the issue selected by the lead merchant banker can charge up to 1.5 per cent of the value of the equity sold through them. However, since some shares of the new issue may be directly sold by the issuing corporation, the total brokerage costs of the issue may be less than 1.5 per cent of the issue proceeds.

By contrast the rights method can be equally reliable and, at the same time, cost the issuing company little or nothing. To see this point, let us note that the benefit to the current shareholders of the issuing company from holding the rights is the differential between the ex-rights price, that is, the market price per share after the rights are issued, and the subscription price of each new share. This benefit is positive as long as the ex-rights price exceeds the subscription price. Therefore, by setting the subscription price sufficiently low, this benefit can be made virtually certain, inducing the current shareholders to exercise their rights and take up the new issue. Equivalently, if a shareholde does not exercise his rights, or does not sel his rights to another shareholder who wil exercise the rights, his wealth is reduced b the market value of the rights. By making thi cost appropriately high through a sufficiently low subscription price, the probability o the failure of a rights issue can be mad arbitrarily small. Though there are a larg number of shares outstanding after the issue for any shareholder who exercises the right the *pro rata* ownership of the corporatio remains the same as before. There is n economic basis to suppose that the stock split effect of a rights offering by itself ca cause valuation losses and no empirica evidence to indicate that investors generall consider stock-splits as bad news. Further, i the entire new issue, for whatever reason, i not subscribed, a stand by underwriter can b contracted to take up the remaining shares a the end of the subscription period. Thoug this will require some cost, the resulting co will be considerably less than the underwriting cost for the full issue.

A new issue involves a number of othe usually smaller, expenses required fo advertising, printing and mailing of issu prospectus and share application form registration of shares, listing of the issue wit an exchange, and printing and mailing o share certificates and refund orders. Normall these expenses are also considerably highe for a public issue than for a rights issu According to the informal estimates supplie by the ICICI, one of the leading mercha banking houses in India, the other expense may add up to 3.5 per cent of the issu proceeds for a public issue of equity of Rs 5 crore and above. The corresponding figu for a rights issue of the same size is le definite but appears to be around 1.5 per cent.

On balance, if a corporation has the choic of raising a certain amount of long-ter capital through either a public issue or rights issue of long-term securities, the publi issue method will have the advantage c certification but, at the same time, enta appreciably higher costs. Since the 'sel insurance' of the success of a rights issue virtually costless, the difference in iss costs of a rights offering and a publ offering of the same size and same certain of issue success can be substantial. F example, for a Rs 50 crore offering of ne equity in India, the cost differential can be high as 6.6 per cent of the issue proceeds the rights offering is not managed by merchant banker, 0.6 per cent going towa merchant banking fees, 2.5 per cent towa underwriting commission, 1.5 per cent towa brokerage fees, and around 2 per cent bei accounted for by the other expense Documented evidence indicates that th differential is substantial, though somewh lower, also in the US capital markets.[11]

Conceivably, the differential between t actual total costs of the two issue methods even larger. There are implicit or indir costs associated with each method which a by their very nature, harder to estim

precisely. Even so, it would appear that they are, like direct costs, appreciably higher in the case of public issues. Although no systematic study on the subject has been undertaken in India, the existing studies in the US have identified principally two types of indirect costs associated with offerings of long-term securities: underpricing and negative reaction in the secondary market. Underpricing occurs when the offer price for the new issue is set below its true price or the price the market can bear. No matter why underpricing takes place,[12] underpricing cost adds to the direct floatation costs noted above. Measuring the extent of underpricing by the level of the offer price relative to the closing price on the day immediately following the offering, various studies have found that, on an average, underwritten issues of industrial corporations in the US are underpriced and that the magnitude of underpricing is statistically significant [Eckbo and Masulis 1989; Smith 1977]. Underpricing, however, is not an issue in the case of rights offerings as long as the rights are exercised, there being no change in the *pro rata* ownership of the corporation for the current shareholders. In fact, as we have discussed above, for a rights issue to be successful, the offer or subscription price must be lower than the ex-rights price.

The other component of indirect costs, namely, observed decline in the price of a corporation's outstanding stock in the secondary market consequent to the announcement of a new offering, can be very sizeable. The studies on the subject in the US have found that negative secondary market reaction to offerings of new equity by existing corporations is pervasive regardless of the offering method employed.[13] However, the negative market reaction to public offerings has been found to have twice the magnitude of the reaction to other offerings by industrial corporations [Asquith and Mullins 1986; Masulis and Korwar 1986; Eckbo and Masulis 1989]. In the case of offerings by public utilities also, market reaction appears to be more negative to underwritten offerings than to other offerings. Since the price decline is spread over all existing shares, the cost implications of an adverse market reaction can be huge. A 3 per cent decline attributable to the announcement of the new offering, which is the observed average decline for underwritten offerings by industrial corporations, translates into a loss equivalent to 30 per cent of the gross proceeds if the size of the new issue is about a tenth the size of the outstanding equity.

Although no systematic empirical study on the magnitude of either of the two types of indirect costs of new issues in India exists, there have been enough reports in the financial press, and many expressions of concern by the regulatory authorities, to suggest that underpricing is a persistent phenomenon. In fact, prior to the repeal of Capital Issues (Control) Act on May 29, 1992, the prescribed system of determining the price of new issues of equity was designed to make it significantly downward biased relative to actual market value.[14] The SEBI guidelines currently in force permit, within certain restrictions applicable largely to first public issues of new or existing private and closely held companies, 'free pricing' whereby the issuing company is empowered to decide on the issue price in consultation with the lead merchant banker.[15] The extent of underpricing under the new policy will probably go down and gravitate towards the level observed in other countries.

III
Choice of Offering Methods

As we have mentioned above, all documented evidence in the US indicates that, in spite of a substantial cost disadvantage, public issues are an overwhelmingly more popular method of raising long-term capital than rights issues. Although reliable data regarding patterns in security issues in India is scarce, on the basis of our existing evidence as well as conversations with corporate finance professionals it appears that public issues have been a more important capital raising method in India also. One of the present authors [De] has researched the probable causes of this apparently puzzling phenomenon in a general context and examined the implications of the general model for the US capital markets.

It has been recognised that markets for new issues are likely to have serious Akerlovian information asymmetry problems. It is in the nature of these markets that the issuers will know more about the quality of their issues than the outside investors. If anything, this problem is likely to be appreciably more acute in Indian capital markets than in their counterparts in the US. It makes sense to argue that in these markets the issuers will choose the offering method, out of the several available, which will be the best for them given the private information held by them.

Given asymmetric information in the markets for new issues, De and Nabar (1991b; 1992) have focused on the certification aspect of the underwriting process as being the key to the issuing corporation's choice of the offering method. They have noted that the public issue process has several distinct parts: namely, origination, certification, marketing and underwriting, and distribution of the new issue. However, all offerings require origination, marketing, and distribution. Further, as we have noted above, the insurance of issue success offered by underwriting, while undoubtedly important, has to be viewed in relation to the fact that a rights offering can provide virtually costless self-insurance. However, certification, which usually involves extensive investigation and audit of the issuing firm's activities, frequently with the help of legal, audit, and engineering experts from outside the corporation, is one function that appears to set public issues apart from the other offering methods. The other offering methods usually do not incorporate similar third-party evaluation. The value of this type of evaluation would be potentially high under asymmetric information between the managers and other insiders of the issuing corporation and all other investors including, perhaps, the current shareholders.[16]

In their work, De and Nabar postulate, realistically, that the certification process is noisy but efficient. Any or all of the components of what constitutes the investigation and audit of the issuing firm, including external opinion sought and obtained, can contribute to the noise in the merchant banker's evaluation. However, though a high quality issue may not always secure a favourable evaluation, or, for that matter, a low quality issue may not always obtain an unfavourable evaluation, the evaluation of a truly high quality issue is more likely to be favourable than the evaluation of a low quality issue.

In this setting, given imperfection of third-party evaluation, the issuing firm's choice of the offering method also has an information-transmitting role. The market beliefs and, consequently, market values in this model are conditioned by what the issuing firm conveys through its actions and what the merchant banker conveys through his findings.[17] Thus, if two types of firms (or, equivalently, issues), high quality and low quality, exist in the market though their respective quality levels are not directly observable to the outside world, and if they can freely choose between the two offering methods, two outcomes are possible: (1) if the cost differential between the two methods falls below a certain level, a pooling outcome in which all firms opt for merchant banking and the public issue process; and (2) for higher differentials, a semi-separating outcome in which all high quality firms opt for public issues while low quality firms follow a randomised strategy. High quality firms, with a higher likelihood of obtaining favourable certification for their offerings, expect to fetch a higher market value for their issues if they choose public offering. Since the certification process is noisy, some low quality firms also opt for public offering with a view to benefiting from the noise and possible misclassification. However, as more and more low quality firms choose public issues, the expected value of a low quality issue in this pool is diluted and, given a sufficiently high cost differential, is eventually no higher than what could be obtained from a rights issue which is uncertified. As a result, in the second equilibrium the low quality firms at the margin are indifferent as to the choice of the method and, consequently, randomise between the two issue methods. This result could be reinterpreted by saying that while a proportion of low quality firms choose public offering, the rest will choose the rights method. It can be shown that this proportion is unique, given the parameters of the system such as the differential between the costs of the two issue methods.

It should be noted that the second equilibrium is informationally more efficient

than the first equilibrium. In the second equilibrium, low quality firms are partially separated from high quality firms in that any firm making a rights offering is correctly identified as a low quality firm, while both types of firms may make public offerings. By contrast, in the first equilibrium there is no separation between firm types at all; all firms make an identical choice. The second equilibrium is also more consistent with empirical evidence than the first, since the rights method is used in practice to market a positive, though small, proportion of new issues. In terms of our analysis, it would appear that, empirically, relative costs of the two issue methods are appropriate for the second equilibrium to obtain.

IV

Implications of SEBI Guidelines

We now consider the implications of certain SEBI guidelines for the two offering methods in the light of our discussion in Sections II and III above.

In terms of the guidelines for merchant bankers issued by the government of India, ministry of finance in 1990,[18] all issues should be managed by at least one authorised merchant banker functioning as a sole manager or the lead manager. Subsequently, the SEBI has clarified that the guidelines cover public as well as rights issues, though in the case of rights issues of smaller size, implying issues of Rs 50 lakh or less, the issuing company will have the option to manage the issue itself or through a merchant banker.[19] Accordingly, for all issues above Rs 50 lakh management by an authorised merchant banker is mandatory. It may be noted that the guidelines in effect cover all issues, since rights issues smaller than Rs 50 lakh are exceedingly rare. In fact, in the month of November 1992, the last month for which this information is available, the smallest rights issue was exactly Rs 50 lakh, while the average issue size was as large as Rs 2,941.75 lakh.[20]

Separately, the SEBI has advised that in the case of rights issues lead managed by merchant bankers, they should submit a due diligence certificate to the SEBI. Together, the two guidelines have made merchant banker certification of effectively all rights issues mandatory in India. This is a marked departure from the regulations in other countries where rights issues typically do not require such certification.

Undoubtedly, the SEBI guidelines in this respect are well-intentioned and meant to enhance investor protection. However, they are open to problems of design as well as enforcement. In the usual set-up where more expensive public issues, managed by investment bankers, are certified for quality and the less expensive rights issues are not, the issuing company, by its deliberate act of opting for one or the other method, conveys valuable private information to the rest of the market. As outlined in Section III above, all other things being the same, a corporation with a high quality issue will be more inclined to seek certification than a low quality issue. However, since both public and rights issues require certification than a low quality issue. However, since both public and rights issues require certification by merchant bankers under the new SEBI guidelines, the only remaining difference of consequence between the two offering methods is the fact that public issues need costly underwriting for issue success while rights issues can virtually costlessly guarantee it. Separately, as part of its guidelines for disclosure and investor protection, the SEBI has made full underwriting mandatory for a public issue.[21] Hence, between a public issue with full underwriting and a rights issue of the same size, the differential in total issue costs will include the cost of full underwriting as well as the other costs which, as we have seen in Section II above, are also appreciably higher for a public offering. Provided all other things remain the same, this is likely to result in a shift of corporate preference from more expensive public issues to less expensive rights issues. One can think of two undesirable consequences of this development.

First, while in a public offering the issuing corporation seeks to approach the entire investing community, in a rights offering it focuses only on its current shareholders. A shift from the former method to the latter will be a regressive step in view of an important goal of the current financial sector reforms in India, namely, to have the corporate sector raise external funds increasingly from private investors and, in the process, achieve wider public participation in capital market activities. This goal, which has been articulated many times by various government sources, is intended to reduce the traditional dependence of the corporate sector in India on special financial institutions owned and/or controlled by the government, including the IFCI, ICICI, IDBI, and other national and state-level institutions, for the bulk of its long-term capital needs, often on concessional terms. As we have noted in Section I above, in the process the financial institutions have come to acquire considerable equity stakes in major Indian corporations. A recent survey of institutional holdings in the financial press indicates that the special financial institutions own between 35 per cent and 66 per cent of the equity in each of the 25 largest private corporations in India.[22] Under the circumstances, a rights offering by an Indian corporation involves, in a large measure, going back to the same financial institutions, and through them to the government, for more capital participation.

Another, and a potentially more serious, problem with this set of SEBI guidelines is that there is a very real possibility that they will result in making the capital markets in India informationally *less*, rather than more, efficient. In other words, their effect will be precisely the opposite of what the regulatory authorities have clearly intended to accomplish by requiring third-party certification of all offerings. With rights issues costing appreciably less than public issues while both types of issues carry the merchant banker's certification, the logic of the arguments in Section III above indicates that all issues will be rights issues and the resulting equilibrium will be a pooling equilibrium where the pool will consist of only rights offerings. However, as we have noted in Section III above, a pooling equilibrium is less informative than a semi-separating equilibrium where both types of offerings are made. While the latter equilibrium allows for partial separation between different types of issues in terms of quality, the former permits no differentiation at all. In this sense, the new situation is informationally less favourable for the investors than the normal scenario where only public offerings require certification, a feature which, coupled with a sufficiently high cost differential, results in a semi-separating equilibrium (see Section III above).

The argument behind the above observation can be stated as follows. A rights offering with certification offers as much as a public offering with full underwriting, but at a lower cost. As a result, the issuing corporation which would previously opt for a public offering now decide in favour of a rights issue. To that extent, there is no net change either in the total volume of certified offerings or in the information generated for the investing public. However, the low quality issues which previously would not go through the process of certification, the cost being too high in relation to the possible gains from misclassification, and would be recognised as low quality issues as a result have now access to certification through a low-cost rights offering. The certification process being imperfect, some of them wil

Table: New Capital Issues by Non-Government Public Limited Companies in India

(Volume in Rs crore)

	April 1989-March 1990*			April 1990-March 1991*			April 1991-March 1992*			March 1992-February 1993*		
	No	Volume	Per Cent	No	Volume	Per Cent	No	Volume	Per Cent	No	Volume	Per Cent

ecure a higher classification than they merit note that, for them, there is no corresponding isk of being misclassified lower than they leserve). To that extent, information available o the potential investors will be vitiated.

We have argued above that the SEBI uidelines on merchant banking are designed o induce a shift in corporate preference from ublic offering, which has traditionally been he major method of raising long-term capital n India, to rights offering and noted some irable implications of this developt. There are indications that, in a good the shift has already taken place. table presents evidence in support of this ervation. In 1991-92, there was a sharp crease in the share of rights offerings in the tal volume of new capital issues, from a ttle over a half to almost two-thirds. It may noted that 1991-92 was the first financial ar following the SEBI directive, issued in ptember 1990, which explicitly made anagement and certification by a lead erchant banker mandatory for all rights ferings. Preliminary evidence indicates that e share of rights offerings has gone up even gher in 1992-93. This increase is especially nificant in view of the fact that the total lume of new capital issues has itself creased considerably in each of these two ars. In its last annual survey of Indian pital markets, the RBI has highlighted this velopment, but has not attempted an alysis of the underlying reasons.[23]

ecommendations and Conclusions

The priorities of a national regulatory ncy like the SEBI may appear occasionally conflict with each other. Investor protecn and smooth and efficient functioning of ital markets are two examples of such rities. In a genuine conflict, one could l enough justification for the SEBI to phasise investor protection at the expense capital market efficiency. However, at a per level of understanding and analysis, a flict of this nature is often more illusory n real. In fact, in many cases what promotes ital market efficiency is also what mately enhances investor protection. This ainly is the case when market efficiency sists in reduction of asymmetric rmation between the management of the ing corporations who typically have ate information about the quality of issues and the rest of the market icipants who usually are not privy to it. lly, the latter are better protected as they more informed. This observation has two ications for regulatory action. First, a latory control on normal market hanisms initiated in the mistaken notion fering better protection to investors may unter-productive and, if so, should be led. Second, it is important to promote et mechanisms which improve capital et efficiency by mitigating asymmetric mation problems, because it ultimately s in sc under investor protection.

In our recommendations, we have been guided by these two considerations. A prime candidate for the application of the first principle is the SEBI guideline which has made management by a lead merchant banker and certification mandatory for rights issues. Though this particular SEBI guideline was, undoubtedly, intended to generate more information about the quality of the rights offerings, as we have discussed in Section IV above it is likely to have resulted in less information being available to the investors at large to help them in their investment decisions. To correct this problem, we recommend repeal of the regulation in question and suggest that management and certification by a lead merchant banker should not be required for rights issues. In other words, we recommend that, in this regard, the regulatory system in India resemble the system in the US and elsewhere.

The second consideration, namely to suggest measures which would reduce asymmetric information in capital markets and thereby enhance investor protection, has prompted us to look at a related SEBI guideline. This is the guideline (see note 30) which has made full underwriting mandatory for a public issue. The same guideline also lays down a minimum 90 per cent subscription rule. If an issuing company does not receive 90 per cent of the issue from public subscriptions plus accepted commitments from the underwriters within 120 days of the opening of the issue, the company is required to refund the subscribed amount. This part of the guideline is apparently based on the logic that unless a firm is able to raise a substantial part of the capital required for a project, it will not have sufficient funds to undertake the project, in which case it should refund the money which was contributed in the belief that the project will be undertaken. However, given mandatory full underwriting this part of the guideline will be triggered only if one or more underwriters renege on their accepted commitments. In this case the issuing company itself merits protection, not punishment.

In its present form, this guideline is unquestionably difficult to justify. The simultaneous imposition of mandatory full underwriting and 90 per cent subscription rule is not only unnecessary for investor protection, it also imposes significant avoidable costs on the issuing corporations and perhaps also on the regulatory authorities. However, suitably modified the guideline could be used to improve capital market efficiency, reduce offering costs for the issuing corporations and, at the same time, enhance investor protection by generating more reliable information about the quality of the issues. The following modification could be proposed. Continue the 90 per cent subscription rule but make it stronger and have the issuing corporations refund the subscriptions with a penalty, the amount of the penalty in each case being proportional to the extent of the shortfall from 90 per cent. Given this provision, underwriting could be made optional for the corpora... choice of the level of underwriting—low, high, or full as the case may be—would then signal their private information about the quality of their issues, a low level indicating a high quality. The corporations that are confident of a favourable market response to their offerings would benefit from this provision and save considerable issue costs now eaten up by underwriting fees. It may be recalled from our discussion in Section II above that the underwriting fees in India are based on the amount of the new offering being underwritten, and not on the amount, if any, being eventually picked up by the underwriters. A corporation which chooses underwriting for 10 per cent of its issue will have its underwriting costs reduced to 0.25 per cent of its issue proceeds from the present level of 2.5 per cent. Further, regulatory supervision would be necessary to ensure compliance with one requirement rather than the two under the current guidelines. This, too, would presumably result in cost savings for the corporations as well as the regulatory authorities. Finally, the provision of refund of subscriptions with a penalty based on the extent of the shortfall will constitute a check on the possible tendency of the issuing corporations to signal falsely, because the potential cost would be higher for low quality issues than for high quality ones.[24]

A distinguishing feature of the above recommendations is that they substitute, for the most part, market mechanisms for government regulations such as mandatory certification for rights issues and mandatory full underwriting for public issues. It may be noticed that we have recommended the substitutions not because we take the position that government interventions are in general inferior to market forces in achieving most economic objectives but because, in the present case, the SEBI's objective of improving disclosure of private information and investor protection can be achieved in an economically more efficient way through the market mechanisms suggested above. To make our case, it has not been necessary for us to appeal to any of the well known economic and extra-economic arguments which may be invoked against government interventions in general. Having said that, we must mention that at least one of them is very relevant to the present case. As Krueger (1984) has pointed out, a regulation, once introduced as a response to a real or perceived crisis, induces the regulated parties to attempt to circumvent it, which in turn motivates the regulatory authorities to intensify the regulation or introduce additional interventions. Since the regulations in the present case may fall short of their goals, it may very well result in escalation of controls and regulations. The experience with regulations in other sectors of the Indian economy provides little assurance that it will not happen.

Notes

[The authors thank the Centre for Management and Development Studies (CMDS) at the Indian

Institute of Management, Calcutta, for financial support for the study. They benefited from discussions with many representatives of financial institutions and regulatory authorities They are especially grateful to A Chowdhury (ANZ Grindlays Bank), K A Chaukar (ICICI), G R Ramakrishna (SEBI), R Ravimohan (OTC), and R Vishwanathan (SBI Capital Markets) for their detailed input. They also thank the seminar participants at the Indian Statistical Institute (Delhi), Delhi School of Economics, National Institute of Public Finance and Policy (Delhi), and the Indian Institute of Management (Calcutta) for their comments on earlier versions of this paper. None of them, however, is responsible for any of the views expressed in this paper]

1 The Securities and Exchange Board of India Act, 1992, Chapter IV
2 The annual survey of capital markets in India, undertaken by the Reserve Bank of India and published in its annual report, provides aggregative data on the subject
3 A very recent articulation of this goal is found in the Pre-Budget Economic Survey, presented to parliament in February 1993 by the ministry of finance, which recommends, among other things, that "the corporate sector will have to be encouraged to raise resources increasingly from the market"
4 82 per cent of all equity offerings by companies in the US during the period 1963-81 were public issues, the other 18 per cent being rights issues [Eckbo and Masulis 1989] Further, fully two-thirds of the rights issues had a 'stand-by' underwriting arrangement whereby they could be sold to the public at large if they were not taken up by the existing shareholders Corresponding data for India is available only for more recent years see Section IV
5 See Section 4(g) of the Guidelines for Merchant Bankers, dated April 9, 1990, issued by the ministry of finance and subsequent notifications on the subject by the SEBI See also our discussion in Section IV
6 To ensure a direct stake in the issue under their management, the lead merchant bankers are required under the new guidelines to accept a minimum of 5 per cent underwriting obligation in the issue (see the Guidelines for Merchant Bankers, Section 4(h), April 1, 1990, issued by the ministry of finance), subject to a ceiling The SEBI has subsequently decreed (notification No F8/III/MB/92-SEBI, January 2, 1992) that the outstanding commitments of any individual merchant banker should not exceed five times his net worth at any point in time
7 This mode of underwriting is comparable to what is known in the US as 'stand-by underwriting', in the sense that the underwriter stands by to see if the public will subscribe to the shares in the first place In terms of the underwriter's liability, this particular arrangement stands somewhere between a 'firm commitment underwriting' arrangement and a 'best efforts' arrangement As its name implies, under a firm commitment underwriting arrangement the underwriter provides an explicit guarantee, a firm commitment, that the issue will be marketed The underwriter actually purchases the new issue from the issuing corporation at an agreed-upon price and then offers it for sale to the investing public on his own account The spread between the price paid to the corporation and the offering price to the public constitutes the bulk of his compensation On the other hand under a 'best efforts' arrangement an investment bank, without guaranteeing any results, undertakes to sell as many of the new shares as possible at an agreed-upon price It should be noted that neither of the above two underwriting arrangements are prevalent in India By contrast, however, firm commitment underwriting is by far the most popular mode of public issues in the US, accounting for as much as 82 per cent of all public issues and 88 per cent of all underwritten issues 'Best efforts' arrangements are, on the other hand, used exclusively to market initial public offerings of small companies
8 See Sections 4(i) and 4(j) of the Guidelines for Merchant Bankers, April 9, 1990, issued by the ministry of finance
9 As its name implies, a rights issue with a stand-by underwriting arrangement is a cross between the two methods Like the rights method this method offers privileged subscription rights to the current shareholders However, under this arrangement an underwriting syndicate is hired to 'stand by' during the subscription period and to 'take up' all unsubscribed shares at the end of this period at the subscription price Typically, the compensation of the syndicate consists of two distinct elements an initial stand-by fee and a take-up fee proportional to the number of shares taken up and resold
10 We are grateful to M K Jajoo of the ICICI, Calcutta, for sharing this information with us
11 In the most comprehensive empirical study on the subject, Eckbo and Masulis (1989) found that the ratio of total direct costs to gross proceeds was 6 8 per cent in the case of underwritten public offerings, 4 27 per cent in the case of rights offerings with stand-by underwriting based on the observed average take-up of 5 per cent of the issue by the underwriter, and 1 68 per cent in the case of pure rights offerings For public utilities, the ratios were 4 36 per cent, 2 51 per cent and 0 6 per cent, respectively Other studies have also noted significantly higher direct costs in underwritten offerings
12 Among other reasons, it has been suggested in the literature that the underwriting syndicate resorts to underpricing in order to favour preferred customers and to be able to market the issue with certainty
13 For a discussion of some of the possible explanations for the observed negative market reaction, see Smith (1986)
14 Under this system, the Controller of Capital Issues used to arrive at the 'fair value' of a new issue of equity on the basis of 'net asset value' (NAV), 'price earnings capitalisation value' (PECV), and market value of the issue If the average of NAV and PECV, capitalised at a specified rate, fell short of market value by less than 20 per cent, the average was regarded as a fair value In other words, as much as 20 per cent undervaluation was considered acceptable Since revaluation of fixed assets was not ordinarily permitted for NAV computation, the average was usually an underestimate of the true value
15 See SEBI guidelines for disclosure and investor protection *vide* GL/IP No 1/SEBI/PMD 92-93, June 11, 1992, and the clarifications issued thereon
16 Baron (1982), Beatty and Ritter (1986), Booth and Smith (1986), Hansen (1986), and Rock (1986), among others, have drawn attention to this feature of the underwriting process, though they have not specifically considered its significance in the issuing firm's choice of the offering method
17 In this regard, their work draws on their study of the economic implications of costly and imperfect quality evaluation in a general framework [see De and Nabar 1991a] The ensuing capital raising game between the informed insiders of the issuing firm and the uninformed outside investors is somewhat different from and more complex than standard signalling games, not the least because it incorporates two states of nature one, the uncertain issue quality, and, two, the uncertain underwriter s findings which are imperfectly correlated with issue quality and are not observable before the choice of the offering method is made

22 See 'Corporate Dossier' in *The Economic Times*, June 19, 1992
23 "A marked feature of the new issue market during 1991-92 was the substantial rise in rights issues" (Reserve Bank of India Annual Report, 1991-92, p 64)
24 It may be noted that the scheme we are proposing here is essentially similar to the much discussed model of insurance contracts under asymmetric information where healthier insurees opt for a contract with a higher deductible and a lower premium than the others [see Rothschild and Stiglitz 1976; Riley 1979, Wilson 1980] Purchasing underwriting services is, after all, purchasing insurance against a possible lack of public response Given a suitable equilibrium concept [Riley 1979], this scheme may be shown to successfully separate different quality types

High Price-Earnings Ratio of Indian Stock Market and Investment by Foreign Financial Institutions

Sidharth Sinha

*This paper explores the high level of the price-earnings (P/E) ratio of the Indian stock market in the context of investments by foreign financial institutions. The measured P/E ratio may be high because of abnormally low earnings during 1991-92 and the high P/E ratios of foreign controlled enterprises. Even after adjusting for these two factors the P/E ratios is likely to be high relative to historical levels and relative to P/E ratios of other emerging markets. However, given its excellent diversification potential the Indian stock market may be attractive to foreign investors in spite of its high P/E ratio.**

WITH the opening of the Indian financial markets to foreign financial institutions attention has focused on the valuation of stocks on the Indian stock market relative to the valuation of stocks of other emerging markets as measured by their P/E ratios. As Table 1 shows the P/E ratio for the Indian stock market at the end of March 1992 at 55 was way above that of other countries, the next highest being that of Argentina at 31. Of course, this was before the scam disclosures and since then the P/E ratio has dropped to about 30, as of end November 1992. The increase in the P/E ratio seems to have begun in July 1991, following the announcement of the government's liberalisation policy, reached its peak in March-April 1992 and has been declining since. However, as Table 2 indicates as of August 1992 the P/E ratio is still high compared to those of other countries. The high P/E ratio cannot be attributed to higher expected growth rate since India's estimated 1993 GDP growth rate of 4.5 per cent is at the lower end of the estimated growth rates for emerging markets. The current P/E ratio is also high when compared to the P/E ratio of about a year ago of 24. Presumably, the high P/E ratio would render the Indian equity market unattractive for foreign investors so that the expected inflow of foreign funds would not occur. This paper argues that the measured P/E ratio, based on the most recent reported earnings, may be high because of abnormally low earnings in the recent past. Perhaps the market does not expect this to continue in the future so that with more normal earnings the measured P/E ratio will be lower. In the process of carrying out this analysis we also identify certain patterns in the P/E ratio across firms. The most important of these is the relatively high P/E ratio of foreign controlled companies *vis-a-vis* domestic companies. Finally, we also show that given its superior diversification potential in an international portfolio context the Indian stock market may be attractive for foreign investment in spite of its relatively high P/E ratio.

The paper is organised as follows. Section I presents the conceptual foundation for the significance of the P/E ratio. Section II describes the data sources for the study. Section III examines the patterns in the P/E ratios of the 100 companies in the National Index. Section IV analyses the relationship between foreign control and P/E ratios. Section V evaluates the diversification potential of the Indian stock market *vis-a-vis* the stock markets of other emerging markets from the perspective of an US investor. Section VI concludes and presents issues for further research.

I
What Is P/E Ratio?

The price-earnings ratio is defined as the ratio of current price to *expected* earnings. The significance of the P/E ratio is derived from the perpetual growth dividend discount model for firm valuation. According to this the current price P_0 is given by

$$P_0 = \frac{DIV_1}{(r - g)}$$

where DIV_1 is the dividend expected next period which is expected to grow in perpetuity at rate g; r is the market capitalisation rate. Assuming growth is through reinvestment of earnings it can be shown that the P/E ratio is given by

$$\frac{P_0}{EPS_1} = \frac{b}{r - (1-b)ROE}$$

where b is the payout ratio, ROE is the return on equity and EPS_1 is the *expected* earnings per share.

According to this a high P/E ratio implies a low expected rate of return, r, by holding the firm's equity as in the case of a low risk firm. However, a high P/E ratio is consistent with a high r if the payout ratio is low and ROE > r so that the firm has a high growth rate through positive NPV opportunities. This would be the case with high risk high growth firms. Therefore, a high P/E ratio implies either or both a lower market capitalisation rate or more valuable growth. Commonly reported P/E ratios are calculated as the ratio of price to the most recent actual earnings and not expected earnings as the definition requires. Calculated this way the P/E ratio may be high, irrespective of the capitalisation rate and growth opportunities, if there has been a decline in earnings and the market perceives it to be transitory. Moreover, earnings per share is an accounting number and will be influenced by the accounting practices of the company with respect to such items as depreciation and inventory valuation. Thus differences in P/E ratios

TABLE 1 COMPARATIVE VALUATIONS OF EMERGING MARKETS—I
(End March 1992)

Market	Price-Earnings Ratio	
	This Quarter	One Year Ago
Latin America		
Argentina	31.72	3.38
Brazil	18.25	8.79
Chile	17.94	11.36
Colombia	30.81	11.52
Mexico	17.13	13.43
Venezuela	26.95	28.48
East Asia		
Korea	15.97	19.07
Philippines	16.63	30.24
Taiwan	23.51	27.37
South Asia		
India	55.17	19.82
Indonesia	15.25	23.75
Malaysia	27.28	24.85
Pakistan	12.78	8.04
Thailand	20.60	25.26
Europe/Mideast/Africa		
Greece	14.71	23.02
Jordan	12.05	23.02
Nigeria	10.09	8.33
Portugal	13.74	17.94

Zimbabwe	5.37	12.23
Developed Markets		
France	14.90	10.90
Germany	16.50	13.60
Japan	29.30	35.20
United States	24.30	16.80

Source: *Emerging Markets Data Base*, IFC, Washington, DC.

may be due to differences in accounting practices even though there are no differences in risk and growth opportunities.

Empirical research has looked at the factors accounting for differences in P/E ratios across companies and the use of P/E ratio in security selection. Beaver and Morse (1978) in a study of the P/E ratios in the US find that the P/E ratios correlate negatively with the earnings growth in the current year and positively with the earnings growth in the subsequent year, suggesting that investors are forecasting only short-lived earnings expectation. They also find that the P/E ratio can vary positively or negatively with market risk depending upon the market conditions in a given year. Therefore, risk also does not supply the explanation for the P/E differences across firms. They conclude that the differences in measured P/E ratios are not because of growth or risk but because of differences in accounting methods for such items as depreciation.

Portfolio strategies based on the P/E ratio have been analysed by Basu (1983 and 1977). These studies show that low P/E stocks tend to earn positive risk adjusted excess returns. This has been one of the more enduring anomalies in finance and many stock selection strategies recommend using the P/E ratio for selecting undervalued stocks

II
Data Sources

For the purpose of this study the sample is limited to the 100 companies in the National Index. The current P/E ratio and cash P/E ratio is as reported in the October 15, 1992 issue of *The Economic Times*. The earnings per share (EPS) and cash earnings per share (CPS) is obtained by dividing the closing price by the P/E ratio and the cash P/E ratio respectively. The EPS is the average net profit after tax per equity share and the CPS is the average cash profit, after adding back depreciation per share. Depreciation as a proportion of CPS is estimated by 1-EPS/CPS. The growth in gross profits, i e, profits before depreciation and taxes, is also obtained from *The Economic Times*. While the growth in net profits would be more appropriate for the study this data is not available in *The Economic Times* and available for only 48 companies in the CMIE publications. Data on market capitalisation is obtained from the Stock Exchange Review of August 27, 1992. Finally, the payout ratio is calculated as last year's annual dividend as a proportion of EPS. Information on foreign control of companies is obtained from the CMIE publication, *Key Financial Data on Larger Business Units*.

Table 3 presents the descriptive statistics for the sample. The P/E ratio is almost double the cash P/E ratio pointing to the significant role of depreciation. The average dividend yield is about 1 per cent which is relatively low compared to the dividend yield of most other countries. The P/E ratio as of October 1992 is almost 50 per cent higher than the P/E ratio of a year ago.

III
Patterns in P/E Ratio

Table 4 presents the correlation coefficients between the P/E ratio and some variables predicted to be related to the P/E ratio on the basis of the perpetual growth valuation model.

For the total sample, the P/E ratio has a significant negative correlation with the growth in gross profits during the past year. This implies that stocks with relatively low earnings growth during the year tend to have relatively high P/E ratios. This is consistent with the argument that investors perceive changes in earnings to have a transitory component and price stocks accordingly. Thus the high P/E stocks will be those for which there is a negative transitory component, i e, the realised earnings was below expected earnings, and conversely for the low P/E stocks.

This may also be applicable to the market as a whole, i e, the earnings overall may have been lower than expected resulting in a relatively high measured P/E ratio. 1991-92 was not a good year for the Indian industrial sector. The index of industrial production grew by only 0.1 per cent during 1991-92 as against more than 8 per cent in each of the previous three years. In fact the index for the manufacturing sector declined by 1.4 per cent. This is also confirmed by the data on growth in profits available from the CMIE publication, *Monthly Review of the Indian Economy*. Of the 48 companies from the sample, for which data is available for 1991-92, only 25 companies had a positive growth in net profits over 1990-91. Of the remaining 23 companies 4 had a loss and 19 had a negative or no growth in net profits. The median growth in net profits was 5 per cent. Moreover, for 636 companies in the private sector the growth in net profit, after taxes and adjustment for non-recurring income, was

Table 3: Descriptive Statistics for 100 Companies in the National Index

Variable	N	Mean	Median
Market capitalisation (Rs crore)	100	902.48	430.12
P/E ratio (current)	90	36.60	29.5
P/E ratio (year ago)	95	24.00	20.00
Cash P/E ratio	90	20.36	17.05
Payout ratio	85	0.46	0.37
Dividend yield (per cent)	93	1.3	1.1
Gross profit growth (per cent)	89	21.75	20.00

Source Data for market capitalisation is obtained from the *Stock Exchange Review* of August 27, 1992. The current P/E ratios are as of October 15, 1992. The payout ratio, dividend yield and EPS growth are based on the most recent data for the previous year available in October 1992.

Table 2: Comparative Valuations of Emerging Markets—II
(Stock market capitalisation as of June 30. All other data August 30, 1992.)

Market	P/E Ratio	Market Cap (Billion $)	Est 93 GDP Growth (Per Cent)	Rate of Inflation (Per Cent)

only 13 per cent during 1991-92 as compared to 42 per cent during 1990-91. However, even with a 20 per cent expected growth in earnings over last year the P/E ratio would be lower only by about five points. Even at 25, the P/E ratio would be high compared to the P/E ratio of other countries.

The other important correlation of the P/E ratio is with the depreciation measure. The significant positive correlation indicates that higher the depreciation the higher the P/E ratio. This is consistent with the conjecture that differences in P/E ratios may be because of differences in accounting practices for such items as depreciation. In this context it may also be pointed out that whereas the P/E ratio ranges from 9.2 to 137.3 the cash P/E ratio, which uses the cash earnings per share, ranges only from 5.9 to 63.8. The standard deviation of the cash P/E ratio is also only 13 as compared to 25 for the P/E ratio. Thus differences in P/E ratios may be because of differences in depreciation.

Finally, the positive correlation between the P/E ratio and the payout ratio must be interpreted carefully. According to the perpetual growth model there is a negative relationship between the P/E ratio and the payout ratio if growth is financed internally and the return on equity is higher than the capitalisation rate. However, given that firms like to maintain stable dividends a lower than expected earnings may cause both the P/E ratio and the payout ratio to be high for a particular year resulting in a positive correlation between them. Secondly, the assumption of internally financed growth may not be valid so that firms may have high growth in spite of high payout ratios.

The results of a multiple regression analysis are presented in Table 5. Given the possibility of a spurious correlation between the P/E ratio and payout ratio this variable is not included in the regression analysis. For the al sample, the variables depreciation measure, growth in gross profits and market capitalisation explain about 16 per cent of the variation in the P/E ratios. The coefficients are significant for depreciation and growth in gross profits.

IV
Foreign Control and P/E Ratios

About a third of the companies in the National Index are foreign controlled. The data confirms that foreign controlled companies tend to have relatively high P/E ratios. As shown in Table 6 the mean P/E ratio is 54 for the foreign controlled firms and about 28 for the non-foreign controlled firms. This difference is statistically significant with t = 4.198. Thus the overall high P/E ratio is partly accounted for by the high P/E ratio of foreign controlled companies. This cannot be as a result of differences in depreciation because the depreciation measure is in fact lower for the foreign controlled firms. Moreover, the mean cash P/E ratio of foreign firms at 32 is also significantly higher (t = 5.888) than that for non-foreign controlled firms at 14.6.

It is possible that differences in earnings growth has contributed to the difference in the P/E ratio between foreign and non-foreign controlled firms. The mean growth in gross profits is 10.8 per cent for foreign controlled firms and 27.4 per cent for domestic firms and the difference is statistically significant (t = 2.313). However, the P/E ratios were significantly different even one year ago with a mean P/E ratio of 32 for foreign controlled firms and 20 for non-foreign controlled firms. Therefore, it is unlikely that differences in EPS growth completely account for the differences in the P/E ratio though it is likely that they have accentuated the difference.

Another possible factor accounting for the high P/E ratio of foreign controlled companies could be the high P/E ratio of foreign controlled drug companies. Among the foreign controlled companies, three drug companies Pfizer, Glaxo and Sandoz have the three highest P/E ratios of 123, 125 and 137 respectively. However, even if these companies are excluded the mean P/E ratio of foreign controlled companies is 45 as against 28 for non-foreign controlled companies.

The difference between the foreign controlled and non-foreign controlled enterprises is also reflected in the results of the regression analysis reported in Table 5. The variables depreciation, profit growth and market capitalisation explain about 41 per cent of the variation in the P/E ratio of the foreign controlled enterprises but only about 20 per cent in the case of the non-foreign controlled enterprises. Moreover, the coefficient on growth in profits is not significant in the case

TABLE 4: CORRELATION COEFFICIENTS BETWEEN P/E RATIO AND OTHER VARIABLES

of non-foreign controlled enterprises. Thus growth in profits appears to be important for explaining variation in the P/E ratios of foreign controlled companies but not domestic companies.

The differences in the P/E ratios of foreign and non-foreign controlled firms is interesting in the light of research in economics on the differential performance of foreign controlled firms. Kumar (1990) compares the characteristics and performance of foreign controlled and locally controlled enterprises across 49 industries. Using the Wilcoxon signed rank test he finds that the measures for size, profit margins, proportion of high income employees in total wage bill, degree of vertical integration, effective tax rate and liquidity are significantly higher, at the 5 per cent or higher level of confidence, for foreign controlled enterprises. On the other hand the measures for the R and D intensity, growth rate, retention ratio and leverage ratio are lower for the foreign controlled enterprises. According to the author, "The picture of FCEs that emerges from the analysis, therefore, is one of relatively larger, more prosperous, vertically integrated, fund flush firms with better paid personnel." The differences in the P/E ratios may be related to these differences in firm characteristics. The study also mentions that in some industries such as motor vehicles, machine tools, man-made fibres and automobile tyres and tubes, local firms affiliated with large industrial houses with the complement of technology obtained on licensing basis from abroad have closely resembled their foreign controlled counterparts in almost all the dimensions covered. With the recent liberalisations, it is possible that licensing and foreign affiliations may become more common thereby reducing or eliminating the differences, including that of the P/E ratio, between foreign and locally controlled enterprises. Experiences of other developing countries in this regard may be useful.

Market Valuation and Foreign Investments

In the context of international investment a high P/E ratio is considered unattractive because it implies a low capitalisation rate. However, in a risk-return framework the capitalisation rate should not be considered in isolation but along with the risk that Indian securities would contribute to an international portfolio. If this risk is low then Indian securities would be attractive even with low capitalisation rates. It may be useful to do this analysis from the perspective of the US investor considering investment in foreign equities. It is possible to work out a break-even rate of return for each market as

$$\text{Break-even rate}: \left[\frac{R_{US} - r_f}{\delta_{us}}\right] \rho_{US,F}\, \delta_F$$

where,

R_{US} : expected rate of return for the US market.

δ_{US} : standard deviation of return for the US market.

r_f risk free rate of return for the US.

δ_F standard deviation of return of the foreign market.

$r_{US,F}$ correlation coefficient between the rates of return of the US and foreign markets.

If the expected return for the foreign market is greater than this break-even rate, then the inclusion of foreign securities in the portfolio of an US investor will result in a superior risk return opportunity set. This result is based on the Markowitz risk return optimisation framework and discussed in Blume (1984). The critical input into the break-even rate is the correlation coefficient. The lower the correlation coefficient, the higher the diversification potential of the foreign securities and therefore the lower the break-even rate.

These break-even rates are listed in Table 7. Among the 20 countries India has the third lowest break-even rate of return of 1.65 per cent. This implies that so long as the expected rate of return is more than 1.65 per cent per year Indian securities will be attractive to US investors in a portfolio context. However, these results must be treated with extreme caution. They are based on historical returns and are subject to all the limitations of using the past to predict the future. In fact the problem may be worse given international differences. Moreover, the risk return aspect is only one of many considerations that would go into international portfolio diversification decisions. These include liquidity, availability of timely information, transaction costs, etc. However, in spite of these caveats one can state that based on historical returns the Indian equity market provides good diversification opportunities for an international investor. The low rate of return implied by a high P/E ratio needs to be viewed in this context.

VI
Conclusions and Extensions

An analysis of the P/E ratios of the 100 companies in the National Index reveals certain patterns useful for assessing the level of the P/E ratio of the market as a whole. Since reported P/E ratios are calculated using the most recent reported EPS

TABLE 7: BREAK-EVEN RATES OF RETURN FOR EMERGING MARKETS

Market	Standard Deviation	Correlation Coefficient with US	Break-Even Rate of Return

Source: *Emerging Markets Data Base*, IFC, Washington, DC

Based on US \$ returns on an annualised basis for five years ending March 1992. The following values for the US market have been used to calculate the break-even rates

$R_{US} = 11.52$ per cent; $r_f = 3$ per cent, $\delta_{US} = 17.74$ per cent

The break-even rate is calculated as

$$\text{Break-even rate} = r_f + \left[\frac{R_{US} - r_f}{\delta_{US}}\right] \rho_{US,F}\ ^{\cdot}$$

they are likely to be higher for companies with recent poor performance. This is cofirmed by the data. In this context the high P/E ratio of the Indian stock market relative to those of other countries may be due to the poor performance of the Indian industry during 1991-92. Perhaps the market considers this poor performance temporary so that on the basis of expected earnings the P/E ratios may not be as high as the reported P/E ratios seem to indicate.

The analysis of the P/E ratios also reveals that foreign controlled companies on average have higher P/E ratios than domestic companies. This is consistent with other research findings that indicate that foreign controlled enterprises have significantly different performance characteristics. With increasing liberalisation of the Indian industry with respect to foreign investment it is possible that this difference may decrease over time. In this context it will be useful to examine the experience of other developing countries. If the differential performance of foreign controlled enterprises is expected to persist, then all market analysis should take this differential into account. Thus from the perspective of foreign financial institutions the diversification potential of foreign controlled enterprises may be significantly different from that of domestic enterprises.

Differences in accounting practices, for example, with respect to depreciation, can also cause P/E ratios to vary systematically from their true values. This is supported by the data for the 100 companies of the National Index. Different accounting practices are also likely to account for some of the differences in the P/E ratios across countries. This could be established by a comparative examination of accounting practices in the various countries under consideration.

Finally, this paper argues that the high P/E ratio and the implied low rates of return for the Indian stock market may be counterbalanced by its diversification potential in an international portfolio context. This conclusion rests on the historically low correlation coefficient between the Indian stock market and the US market, as an example. It is an important question whether this low correlation coefficient will be maintained with the increasing integration of the Indian economy in the world market. This requires an investigation of the pattern of correlation coefficients. Some studies, e g, Roll (1992) have found that similarities or differences in underlying industrial structure determine a significant part of the international pattern of correlations. There may also be patterns in the P/E ratios across industries which has not been analysed in this study.

[I would like to thank Sebastian Morris, Krishna Kumar A, Venkatesh Ganesan and Namrata Rana for helpful discussions. This paper was completed in January 1993.]

Labour Market Flexibility

Arup Mitra

The Indian Labour Market and Economic Structural Change edited by L K Deshpande and Gerry Rodgers; BR Publishing Corporation, Delhi 1994; pp 276, Rs 190.

WITH the structural adjustment programme under implementation, an understanding of the nature and response of the labour market is essential, for the efficacy and success of the new economic policy depend to a large extent on the functioning of the labour market. The volume under review, published earlier as a special number of the *Indian Journal of Labour Economics*, will be widely read mainly because of its topicality and its success in integrating several aspects of the Indian labour market.

Following a brief Introduction by Deshpande and Rodgers, 13 articles have been presented in four different sections, namely, (a) the aggregate employment level, (b) institutional arrangements, (c) technology and labour, and (d) policy issues in economic reform. The first section includes three papers by Jose, Mundle and Papola. Jose examines employment, productivity and earnings per employee data for 19 major industry groups in the organised sector for the period 1970-71 to 1987-88. Seventies witnessed relatively high growth of employment both among the high and low wage groups of industries and during the 80s employment declined considerably in the low wage sector. This tends to discount the view that employment growth in the high productivity sector has been sluggish as wages have been set at a high level. On the other hand, 1980s were marked by a sharp acceleration in productivity rates particularly in the high wage industries. Further, productivity rise improved real earnings as workers in the high wage capital intensive industries could benefit from the rise in productivity by exercising their bargaining strength in the labour market. On the whole, it is rapid productivity growth (resulting from technological factors) which kept labour absorption at a low level while permitting high wages. The shift in the structure of demand in favour of capital-intensive industries led to a decline in the overall employment elasticity of the manufacturing sector during the 80s [Papola 1994]. On the other hand, minimum wages are 'sawdust', not 'hard wood', and are rarely set at levels where they cut seriously into employment.

Rise in productivity levels and deceleration in employment growth rates are, however, not only the outcomes of technological changes but structural reforms as well. Mundle's projections for the early 90s also suggest that though visible underemployment as a phenomenon has been declining quite rapidly, the stabilisation programme could still result in extra underemployment of about half to one million persons per annum. However, for making a forecast about underemployment an analysis based on much greater sectoral disaggregation, sector-specific employment elasticities and inter-sectoral linkages is essential. A more optimistic picture is presented in Papola's paper in the context of the rural non-farm sector. Much of the rise in employment in the rural non-agricultural activities is taken to be demand-induced. Although employment growth in the manufacturing sector has been lower than that in the non-agricultural sector as a whole, it is indeed higher than that in agriculture. Growing public expenditure was mainly responsible for rapid employment growth in the rural non-farm sector in the 80s [ILO-ARTEP 1992]. The fall in public expenditure, including that on anti-poverty programmes, associated with stabilisation is therefore expected to have arrested the employment growth in this sector [ILO-ARTEP 1993].

In the second section the paper by Mathur examines the employment security practices in Indian industry and points out how the notion of employment security regulations has undergone fundamental transformation in the 80s in several ways. Unions are often found to impede the processes of structural adjustment. With greater participation of employees, employers, unions and government, the process of restructuring the Indian economy through institutional change can be made successful. However, in this context it is important to look into the institutional structure and the regimentation of the labour market which has been extensively dealt with in the paper by Rodgers. In fact, he poses two pertinent questions at the beginning of his paper, namely, "How do differences between jobs in quality and desirability affect the setting of employment goals and the design of employment policy? Do they have implications for the strategy of development?" In the face of poverty, jobs of any sort would probably be recommended by the policy-makers but the position he takes is that the creation of jobs is inextricably linked to the nature of the jobs which are created, and, then, who gets them. This determines not only the success of the economy in providing widespread access to income opportunities, but also the level of productivity in the economy and the success of the development process itself. In their study of Coimbatore, Harriss, Kannan and Rodgers (1990) identified seven labour statuses instead of addressing the issues in a dual sector (formal-informal) framework and pointed out that access to these different categories of labour status was unevenly distributed across the population. Methods of access to jobs and patterns of mobility across labour statuses are some of the important indicators of the unequal access to better jobs. Such inequalities in the labour market due to the disadvantaged situation of particular groups can be reduced through affirmative action. The structural adjustment programme is likely to heighten the inequality within the labour market and the brunt of the adjustment process will be borne by those at the lower rungs of the lower status hierarchy (Mukhopadhyay). In particular, women in the labour market, as Kapadia points out in the case of rural wage labour in Tamil Nadu, are in a more vulnerable position as compared to their male counterparts.

In the third section Samaddar talks about new technology, knowledge and power in the context of the newspaper industry. Datta's paper based on a survey in two large engineering firms examines the impact of the introduction of micro-electronics-based technology on labour-management relations. The workers tend to resist new technology as it is mainly labour-saving. Further, since it is highly capital-intensive, huge investment on capital is required which, unless output increases rapidly, will be difficult to undertake without reducing the labour costs and thus employment. This tends to put management and unions in direct conflict with each other and in order to reduce this conflict, output should be inceased rather than employment decreased.

The final section includes four interesting papers by Deshpande, Hirway, Etienne and Kannapan. In addition to the short-run impact of structural adjustment on labour market as discussed by Mundle in the first section of the volume, Deshpande analyses the long-run demand and supply of labour. Liberalisation leads to flexibilisation of labour in the sense that employment of temporary, casual, contract and female labour increases. With increasing exports and direct investment, employment of flexible labour is likely to shoot up. But realisation of full-employment will partly have to

depend on population growth as well. However, what is more important is not just full-employment but, as also emphasised by Rodgers, the quality of employment and the unequal access of certain sections of the population to better jobs in the labour market.

Hirway shows that the primary concern of structural adjustment programme is with the financial crisis, failure of the public sector and the over-regulation of the private sector, and not with poverty and unemployment. Such a partial diagnosis of the economic problems by the policy-makers led them to adopt a programme which is not likely to correct the growth path in favour of the poor. Also Etienne, although more optimistic about the adjustment programme, argues that a new stress on large-scale public investment in agriculture is needed to complement the reforms and Kannapan recommends a long-run strategy integrating employment promotion, human capital formation and development of institutional finance for resolving the conflict.

The volume is indeed interesting and should be read by those with an interest in labour market issues particularly in the context of adjustment policy formulation.

Jharkhand: Focus on Culture

Tilak D Gupta

Jharkhand Movement, Ethnicity and Culture of Silence by Sajal Basu; Indian Institute of Advanced Study, Shimla, 1994; pp 160, Rs 175.

SAJAL BASU's book seeks to take an overview of the Jharkhand movement in its totality. But Basu is primarily interested in detailing and analysing the movement's contribution in helping the people to assert their ethnic identity and regenerate their cultural heritage. This is not surprising, given the author's considered opinion that the positive aspects of the Jharkhand movement lie in the "creation of script, development of language and regeneration of cultural symbols".

The book begins with a brief description of the people and the area and strives to sketch the history of the tribal rebellions of the colonial period. Basu rejects the contention that these tribal revolts represented democratic thinking rooted in the traditional system, nor does he accept the claim of the subaltern theorists who have tried to designate these revolts as a parallel stream in the anti-colonial struggle. Instead he relies on the Bengal judicial proceedings and statements of British officials to argue that "the movements were mostly shaped by gossips and myths created around some leaders who claimed to be God-gifted and/or deputed by an oracle". The question of the author's uncritical dependence on colonial sources apart, it escapes Basu's attention that the above two views need not be mutually exclusive.

The book goes on to depict the various efforts to develop a distinct script and language of the indegenous people and highlights the cultural resurgence taking place in the region. In this connection Basu draws our attention to the growth of the Ol Chiki script and the Kurmali language. But one problem with Basu's book is that it overemphasises the role of intellectuals in such cultural resurgence and neglects the part played by the mass movement in rejuvenating the traditional culture and social customs.

Basu is quite right in pointing out the havoc caused by the state's development and forest policies on the local people's lives. But one wonders why few treatises on the subject mention the role of private sector industries in disrupting the traditional community living of the nature-dependent people. Unfortunately too, the grabbing of tribal land by aliens as well as domiciled moneylenders and powerful rural gentry that still continues, albeit in a subtler manner, does not get attention in the book.

In the chapter titled 'Politics without Polity', the author contends that the 'basic weakness' of the Jharkhand movement is that it does not have a 'constant polity-base', as the process of involvement of new groups and alienation of participant communities continues. Moreover, argues Basu, the existing division of the Jharkhand region among four states where the conditions and responses vary further contributes to this 'in-built weakness'. In this connection he opines that the "Jharkhand leadership and the movement as a whole have failed to design a strategy to square up this weakness".

The political leadership of the Jharkhand movement fares badly in the author's judgment. "The positive achievement of the movement in the sphere of language, identity have been hijacked by the activities of its leaders who carry on their squabbles and personal fortune-making", pronounces Basu rather harshly. However, in line with the book's explicit enthusiasm regarding ethnic issues, the author admires the Jharkhandi cultural organisations as being "most effective in asserting ethno-cultural issues and commonness in ethnicity".

The author is on much stronger ground when he argues that the half-century old Jharkhand movement has never received any democratic response from the governments concerned. Basu suggests that the authorities should consider with a humane approach the demand of the movement for autonomy and distinct cultural existence. But he concedes that the autonomy demand can be realised only when the movement is able to mobilise the masses "to the extent of posing a threat to existing state heirarchy".

But does the Jharkhand movement have the potential to rise to that level? The book appears to be somewhat ambiguous on that score. But it is apparent that the author is sceptical about the possibility of radicalisation of the movement along class lines. On the contrary, he pins his hope on the formation of such demands by the Jharkhand movement that would make the "identity aspirations and sense of indigenousism" of the people "more meaningful".

A monograph on the ethno-cultural aspects of the Jharkhand region or even of a particular area within it would have been interesting reading. It is also true that the various efforts to regenerate and enrich the traditional culture have been an important component of the Jharkhand movement since long. But the difficulty with the book under review is that it seeks to exaggerate the ethnic and cultural factors in the contemporary Jharkhand movement. And this is all the more strange when the struggle for autonomy, particularly where it has a strong and stable mass base, shows distinct signs of being transformed into a regional movement from an ethnic one. Basu, with his passion for ethnicity, however, continues to vaguely label it as a "broad-based ethnic movement".

More to the point, the excessive preoccupation with the ethnic and cultural aspects may marginalise the common people

who support the Jharkhand cause, above all, for realising their rights on land and forest as well as a dignified place in the development process. As the experience of the Jharkhand movement shows, it has acquired a mass character precisely in those areas where efforts were made to link the toiling people's immediate economic demands with the autonomy question. The Jharkhand Mukti Morcha (JMM), the strongest Jharkhandi organisation of the day, despite its present opportunistic politics, owes its popularity among the rural masses precisely to its struggle in the early 70s against land-grabbers and money-lenders.

It therefore appears odd that the book does not mention the role played by these struggles for land and against usury in rendering to the Jharkhand movement a mass character. Besides, the present demographic character of the Jharkhand region where tribals have been reduced to a minority status provides less scope for forging unity in the movement through the medium of "identity aspirations and sense of indigenousism". To put it differently, with the metamorphosis of the Jharkhand movement into a regional movement, the ethnic question is gradually losing its importance in the eyes of its leadership.

To cite an instance, in south Bihar, the nerve centre of Jharkhand movement, most Jharkhandi organisations have settled for Hindi as the link language for the region. The influx of a large number of Hindi-speaking locals into the movement as well as adoption of Hindi by a substantial section of the tribal people for economic reasons have probably made such a choice imperative. Nevertheless, there is a strong case for protecting and developing the tribal languages and providing facilities for imparting education to the adivasis through their mother-tongues. But the book's emphasis on a common Jharkhandi language for cementing a Jharkhandi identity seems rather misplaced. The historical developments of the past so many centuries has, perhaps, foreclosed such a possibility for ever.

As for the cultural resurgence in the region described in the book, two points need to be made. For one, the book focuses mainly on the efforts of cultural regeneration in the West Bengal part of the Jharkhand region where the movement remains a marginal phenomenon. All the contemporary Jharkhandi poetry quoted in Basu's book is written in a language that remains unintelligible to the overwhelming majority of the people of the Jharkhand region falling within Bihar, Orissa and Madhya Pradesh. Similarly, the Ol Chiki script is relevant only for the Santhal language and as yet not quite popular even among literate Santhalis who usually who usually use different scripts in different states.

The other point one would like to stress is that the book fails to locate the cultural resurgence as an integral part of a many-sided mass movement essentially political in nature. Thus the honest Jharkhandi intellectuals active on the cultural front seemingly stand apart from the movement led by 'opportunist' leaders. The text also fails to mention how the JMM-led movement in the early 70s popularised the adivasi social and cultural rituals among a large segment of the Jharkhand population. As a matter of fact it might be easier for the ruling classes to partially accommodate the cultural aspirations of the growing petty-bourgeoisie among the tribals than fulfil the political-economic demands of the toiling adivasis.

For example, Basu laments that "so far, Jharkhand has been denied the privilege of being considered as a linguistic-cultural region". He may now be reassured to learn that the Committee on Jharkhand Matters constituted by the union government has recommended that the "whole of Jharkhand comprising 22 districts spread over four states should be recognised as a distinct cultural area". But such recommendations do not really carry much meaning for those toilers of the region who see the Jharkhand movement mainly as a means to get back their land, forest and human dignity.

As things stand, the unity of the Jharkhand movement cutting across four states with a common aim and leadership indeed seems a remote possibility. One reason for it, as Basu has correctly pointed out, is the existing diversity in the political situations in the different states. Besides, whatever cultural resurgence is taking place is basically intra-tribal in nature and is not leading the Jharkhandis towards a common culture or language. And lastly, what Basu fails to discern is that the continuous penetration of capital into the region has intensified the process of class differentiation in Jharkhand society. And this process will also ensure that various political forces with disparate class ideologies will fight among themselves to capture the centre-stage of the Jharkhand movement.

There are many factual errors in the book that could have been avoided with some careful editing. The index at the end of the book too is incomplete. The cataloguing of "prominent tribes", of the region clubs the backward castes (potter, blacksmith, goldsmith, oil-makers, barbers, etc) and the scheduled castes (washerman, cobbler, dusad) with the genuine tribes to produce an incredibly long list of tribes. The assertion that Kurmali and Sadri are the dominant languages in the Jharkhand region and spoken by 10 million and 5 million people, respectively, is not substantiated by any source. The Jharkhand Co-ordianation Committee, now a thing of history, is referred at one place as "newly-formed" (p 35). A one-time important leader of the Jharkhand movement, Bagun Sambrai, is mentioned at two places in two different spellings, both incorrect.

Public Enterprises and Private Purposes

Sudip Chaudhuri

A basic premise underlying much of the critical writing on public enterprises is that there is something wrong with public enterprises per se. *The author contests this view that public enterprises are inherently inefficient and contends that a crucial aspect has been the objectives and the priorities with which the public enterprises have been run. The focus of the paper is on the manufacturing enterprises under the central government.*

FOR quite some time now the public enterprises (PEs) in India have been subject to attack. The critics refer to the low financial return of the PEs and their poor service, shortages and delays in delivering goods and services, etc. Of course others point out that the deficiencies of the PEs have often been exaggerated. Nagaraj (1993), for example, found that the financial performance of the PEs, in India improved in the 1980s and their resource generation effort is now comparable to that of the private corporate sector. Some PEs, for example, Bharat Heavy Electricals has significant achievements to their credit [Lochan 1991; Ramamurti 1987]. But it is generally agreed that the performance of the PEs on the whole has been less than their potential and below the expectations with which they were set up.

Different aspects of the operation of the PEs have been stressed by different authors/committees to explain their shortcomings. Among the explanatory factors mentioned in the literature are: managerial weaknesses, over-manning and low work ethics, technical inefficiencies, over-capitalisation due to substantial time and cost overruns, faulty investment decisions, political and bureaucratic interferences, the burden of taken over private sector sick units, subsidised pricing, unprofitable product mix (leaving the more profitable items to the private sector), excessive social welfare expenditure, under-investment, using the PEs for private purposes, etc [Bhagwati and Desai 1970: Chapter 9; omic Advisory Council 1987; World Bank 1988: Chapter II; Bagchi 1990; Morris 0; Bardhan 1984: Chapter 8; Ahluwalia 85: Chapter 5; Economic Administration Reforms Commission 1984a, etc].

Restructuring the PEs is an important element of the current programme of Economic Reforms initiated by the central government. Important proponents of such reforms, e g, Bhagwati and Srinivasan (1993: 50-52) recommend that the PEs must be privatised. The government in fact has already initiated steps to get rid of the loss-making PEs though a circuitous way. The government has announced that budgetary support in the form of non-Plan loans to loss-making PEs will be phased out after 1994-95. After the amendment of the Sick Industrial Companies Act, the government has started referring the sick PEs to the Board for Industrial and Financial Reconstruction to decide about the future of these units [Ministry of Finance n d: 18-19]. The board has decided to recommend privatisation (or winding up in case the private sector is not interested) if the government is not willing to invest the requisite funds for revival. As was revealed in the case of a PE, Triveni Structurals, the government did not object to such a plan of action since it was unable to induct additional funds [Viswanath 1993].

A basic premise underlying much of the critical writings on the PEs is that there is something wrong with the PEs *per se*. We contest this view that the PEs are inherently inefficient. In this paper we will try to further pursue the point of view that a crucial aspect has been the objectives and the priorities with which the PEs have been run. We will concentrate primarily on the manufacturing PEs under the central government.

In Sections I to III we will discuss the impact of sluggish and *ad hoc* public investment and how the capacities and the capabilities of the PEs were not properly utilised or developed. These adversely affected the performance of the PEs. In Sections IV and V we will give some examples of how the PEs have been used for private purposes and the inaction and apathetic attitude of the government. In the last section we will sum up the discussion and will argue that a basic factor behind the disappointing performance of the PEs is that those who ultimately control the PEs did not have efficient operation of the PEs as the major objective. They were often not interested in the PEs. And when they were interested, they used the PEs for other purposes thereby hampering the operation of the PEs.

I
Changes in Level and Nature of Public Sector Investment

An important feature of the Indian economy in the post independence period has been the expansion and diversification of the public sector. Public sector gross fixed capital formation at 1980-81 prices increased steadily from Rs 16,420 million in 1950-51 to Rs 78,660 million in 1965-66 (Table 1). The stress initially was on infrastructure.[1] With the Second Five-Year Plan, the manufacturing activities of the PEs rose sharply. Different PEs producing different types of goods and services began to be set up. Central government PEs was envisaged to play the lead role in the economy particularly in the basic goods and the machinery sectors. Among the important central government PEs set up during the Second and the Third Five-Year Plan periods were the steel plants in Rourkela, Durgapur and Bhilai under the Hindusthan Steel (established in 1954), Fertiliser Corporation of India (established in 1961 to take over the Sindri Fertiliser Factory and the Nangal Plant and to set up more fertiliser plants), Heavy Engineering Corporation (HEC) (1956 to manufacture mainly steel plant equipment), Hindustan Organic Chemicals (1960 to manufacture different types of chemical intermediates), Bharat Heavy Electricals (BHEL) (1964 to manufacture power plant equipment, etc), Instrumentation (1964 to provide instrumentation and control systems to power plants, steel plants, fertiliser plants, etc), Bharat Earth Movers (BEML) (1964 to manufacture transportation equipment), Bharat Aluminium Co (1965 to manufacture aluminium), Cement Corporation of India (1965 to manufacture cement), Cochin Refineries (1965), Bharat Heavy Plate and Vessels (BHPV) (1966 for fabrication of equipment for process industries like fertilisers, chemicals, etc).

Interlinkages were self-evident. PEs themselves were to be the major transactors for a number of products. Thus steel plant equipment (manufactured by HEC) were to be used for setting up the public sector steel plants; power equipment (BHEL) for public sector power generation and transmission; railway coaches and other equipment (BEML) for the government monopoly of railways, etc (Table 2).

In 1966-67, there was a sharp fall in public sector gross fixed capital formation (1980-81 prices) in absolute terms to Rs 67,360 million, a decline of 14.4 per cent. It continued to decline and reached Rs 61,610 million in 1969-70. The slide has since been prevented. But it was only in 1972-73 that the level of 1965-66 was crossed. In 1974-75 again the

public sector gross fixed capital formation declined in absolute terms to Rs 69,370 million. It was not before the mid-1970s that the aggregate public sector investment in absolute terms started rising (Table 1).

The sharp fall in public investment in the late 1960s and the stagnation in absolute terms till the mid-1970s was a severe blow to the growth of PEs. Particularly so because it happened at a time when manufacturing PEs were still in the formative stage.

The fall in public investment implied a fall in the demand for PEs producing capital goods. With PEs themselves the major/sole buyers of many capital goods, e g, steel equipment, power equipment, railway equipment, etc, from other PEs, demand naturally appeared as a major problem for them. The fall in demand, by reducing profits and hence resources for investment, in turn had a depressing effect on public investment.

As we mentioned above, in absolute terms public investment recovered by the mid-1970s. But by then the structure and the character of public investment had changed for the worse.

An important sector never recovered. Public sector gross domestic capital formation at 1980-81 prices in railways was Rs 7,790 million in 1960-61. It went up to Rs 14,510 million in 1963-64. Since then it went down steadily to Rs 5,680 million in 1969-70 and further—with some fluctuations—to Rs 5,260 million in 1977-78. It has recovered to some extent lately. But the level of Rs 12,550 million in 1986-87 in absolute terms (at 1980-81 prices) is still below the peak attained in 1963-64 [CSO 1989: Statement 19; CSO 1990: Statement 31].[2] Railways used to be an important buyer of capital goods. In fact in the early 1960s, railways alone accounted for a fifth of the total public sector gross fixed capital formation at current prices [CSO 1983:168-99]. Railways are the sole buyers of a large number of products of PEs, e g, rolling stock, points and crossings, sleepers, springs, etc (manufactured by Burn Standard Company), wagons (Braithwaite and Company), railway coaches, breakdown cranes (Jessop and Company), etc (Table 2). A substantial portion of the installed capital in the public sector thus faced a demand problem. But for the decline in railway investment the capacity utilisation and hence profits would have been much higher, other things remaining the same.

The allocation of central government equity and loans in PEs reflects the priority accorded by the central government to different sectors. It is the single most important source of funds for investment expenditure, the other sources being retained earnings and loans from other sources. As on March 31, 1965, central government invested Rs 20,396 million (equity and loans) in central government PEs (Table 3). In accordance with the priorities in the Second Five-Year Plan and the Third Five-Year Plan, the steel sector received 43.81 per cent of the funds and heavy engineering 11.63 per cent. The other important sectors were petroleum, minerals, coal, etc (Table 3). Since then however the priorities have changed significantly. The public sector steel plants received 18.84 per cent of the funds between 1965 and 1975. The share went down further to 7.48 per cent during the period 1975 to 1990. The corresponding shares of heavy engineering similarly were 8.70 per cent and 1.33 per cent. On the other hand, the producing sectors which gained in importance are coal and power. Similarly the services sector receive more funds now. As on March 31, 1965, the services sector received only 8.34 per cent of the funds. But between 1965 and 1975, the share went up to 20 per cent and further to 23.09 per cent during 1975 to 1990.

When the PEs were set up in the 1950s and 1960s, the capacities were determined with some expectation about the future growth of demand. The latter in turn is linked to the growth of investment in related areas. The changes in investment priorities after the mid-1960s however created demand problem for many PEs particularly in the machine manufacturing sector [Economic Advisory Council 1987: 10]. The level of HEC's steel plant making capacity, e g, was based on the assumption that the country would add 1 million tons of steel-making capacity every year in the 1960s and 1970s. In reality the expansion of capacity was about half that rate. Hence HEC faced a severe demand problem, which is considered to be the most important factor behind its poor financial performance [Ramamurti 1987: 131-43].

The relative decline in steel was compensated by increases in other areas. But the demand remained depressed for the machinery manufacturing units. As we will discuss in the next section, despite indigenous capacity, a part of the demand for capital goods is met from imports. Again, increases in investment, e g, in a number of the services sector generated hardly any demand for the type of machine building capacity India generated.

II
Imports of Capital Goods and Technology

A large number of PEs were set up for manufacturing capital goods and providing technological services. Naturally one would have expected that when new plants are set up and existing plants are expanded in the public sector, the PEs would buy the available capital goods and technology from the sister PEs. In reality however imports of capital goods and technology continued despite the domestic availability.

In a number of cases, the PEs were denied the opportunity to even compete against imports. This is very common in bilaterally aided projects. In such cases the foreign aid agencies usually insist on using the equipment manufactured within their home countries. Power equipment, e g, have been imported under such arrangements depriving BHEL [BHEL 1991]. The grant of contract for setting up the Bhatinda and Panipat fertiliser plants to Toyo Engineering Corporation of Japan was basically influenced by the fact that the Japanese government provided credit for these projects. The public sector company, Engineers India, which was given the task of preparing the initial project reports, actually invited proposals only from Japanese companies though Planning and Development Division of FCI (P and D) was active in the field, equipment too were imported from Japan ignoring Bharat Heavy Plate and Vessels (BHPV) [Gouri n d: 20-28].

Table 1. Public Sector Gross Fixed Capital Formation at 1980-81 Prices

Year	Value (in Rs million)	Annual Rate of Growth
1950-51	16420	
1951-52	18140	10.5

1961-62	51490	-0.3
1962-63	59810	16.2
1963-64	66580	11.3
1964-65	74690	12.2
1965-66	78660	5.3
1966-67	67360	-14.4
1967-68	62300	-7.5
1968-69	63150	1.4
1969-70	61610	-2.4
1970-71	63310	2.8
1971-72	70030	10.6
1972-73	82890	18.4
1973-74	81490	-1.7
1974-75	69370	-14.9
1975-76	82310	18.7
1976-77	101600	23.4
1977-78	108070	6.4
1978-79	108280	0.2
1979-80	110910	2.4
1980-81	116930	5.4
1981-82	130310	11.4
1982-83	152230	16.8
1983-84	151530	-0.5
1984-85	158010	4.3
1985-86	167270	5.9
1986-87	186270	11.4
1987-88	185430	-0.5

Sources: CSO (1989, 1990). Following Chandra (1982; Notes to Table 15), the constant price series for PS GFCG has been obtained by multiplying the PS share in aggregate GFCG at current prices with the aggregate GFCG at 1980-81 prices.

Again when foreign companies are appointed as prime contractors for public sector projects, they often choose international suppliers of plants, equipment and technology ignoring domestic sources. For example, the contract for erecting the Hazira Bijapur Jagdishpur pipeline was given to foreign companies. BEML wanted to produce and supply pipe-layers for the project. But the foreign contractors had their own stock of such equipment. They insisted and were allowed to import them and re-export them after use [Committee on Public Undertakings (CPU) 1988a: 11-12]. Even when indigenous enterprises are competitive, the foreign contractors can ignore them by simply stating that they are unreliable. There is no independent check. The foreign contractors in the Thal Vaishet and Hazira fertiliser plants raised doubts about BHEL's ability to produce reliable equipment and recommended imports of synthesis gas compressors and drive turbines [CPU 1982b: 32]. Again at Thal Vaishet, the foreign contractor arranged for imports of catalysts. It in fact refused to provide performance guarantee if indigenous sources are insisted upon. [Dhar 1989: 281]

In other cases however imports have been justified on the ground that PEs were given the opportunity but they were unable to compete against foreign manufacturers. The government itself progressively liberalised the imports particularly since the 1970s [see, e g, BHPV 1978]. However even when import controls were in force, these were often relaxed due to World Bank's insistence on global tendering for the projects funded by it. Recently the government has decided, e g, regarding public sector power projects, that even if not insisted upon by the financiers, it would go for global tendering on its own for reducing the project costs [*The Economic Times* 1992a].

Price Competition

Higher domestic prices have often been cited as the reason for resorting to imports. Thus while Indian shipyards including PEs like Cochin Shipyard were starving for orders, the public sector Shipping Corporation of India (SCI) acquired only eight vessels from domestic sources against 90 from foreign countries during 1973-74 to 1984-85 on the ground that the latter are cheaper (and also the delivery time is shorter) [CPU 1988b:82].

International manufacturers having surplus capacity for exports often adopt marginal cost pricing for the exported part and charge a price which may not cover the full cost. They still would be earning profits in the aggregate with higher prices charged for the remaining sales. PEs in India were set up primarily to cater to domestic production. Forcing them to compete against such low prices for sales in their main markets

Table 2: Intra-Public Sector Transactions

Enterprise and Products Manufactured	Major Actual/Potential Buyers
(1) Bharat Heavy Electricals	
(i) Power plant equipment	(i) Electricity boards; power companies
(ii) Drilling rigs	(ii) Oil and Natural Gas Commission
(iii) Electric traction and control equipment for electric and diesel locomotives	(iii) Indian Railways
(iv) AC locomotives	(iv) Indian Railways
(2) Burn Standard Company	
(i) Railway rolling stock, points and crossings, sleepers, springs, etc	(i) Indian Railways
(3) Bharat Heavy Plate and Vessels

obviously does not test their competitiveness. They would be either competed out if they do not similarly charge a low price or incur losses if they do. BHEL, e g, successfully competed in international competitive bidding on various occasions [BHEL 1991]. Lochan (1991) found BHEL to be competitive in terms of both price and quality. But analysing the price-cost data he pointed out that BHEL often had to quote too low a price to win tenders with negative implications for profits. As the condition of the PEs weakens and their ability to provide effective competition goes down, the import prices may not continue to be low; the international manufacturers can afford to charge higher prices in the long run.

Suppose however that unlike the situation just discussed, the prices in fact reflect the competitiveness. It is possible to argue that even then imports should not necessarily be allowed even if they are cheaper. As we mentioned above, SCI imported vessels rather than buying them from Cochin Shipyard whose price was higher. If SCI had bought from Cochin Shipyard, then other things remaining the same their profits would naturally have been lower. But on the other hand, if Cochin Shipyard had got the order then its profits would have been higher/losses lower provided of course that the prices were higher than the variable cost. The net impact on the profits for the PEs as a whole would depend on the extent of changes of profits in these two PEs. Depending on the situation, buying costlier vessels from Cochin Shipyard might in fact be more profitable in the aggregate. In India this perspective of thinking for the public sector a whole is missing. It is not that the decisions are always taken at the enterprise level. Very often the controlling ministries are involved. But even when enterprises are under the same ministry (as in our example) the impact on the different firms are not compared before taking the decision.

Non-Price Competition

Imports have been preferred not only because domestic prices are higher, but on the ground that they take more time to deliver the goods, that they are unable to produce the goods as per the required specifications, that they cannot ensure reliability, etc. In fact these non-price factors are cited more often than the price factor in defending imports.

The Department of Post and Telegraph, e g, placed orders for some equipment with Bharat Electronics. However due to long delay in supplying and inability to produce as per the specifications, Department of P and T later withdrew the order and went in for imports [CPU 1986: 105-06]. The engineering contracts for the Thal Vaishet and Hazira fertiliser projects were given to foreign companies on the grounds that public sector organisations like the Planning and Development Division of FCI do not have experience of setting up ammonia plants of 1,350 tonnes per day (tpd) capacity, that their previous experience of setting up plants of smaller capacities were also not satisfactory [Dhar 1989:250-51; Ghosh 1986:703].

That PEs can/may fail to match the quality of imported products and services is not denied. But as we will discuss below, the capabilities of PEs were often not recognised to justify imports. We will argue the more basic point that the full potential of PEs were not explored to make them more competitive.

The PEs as we have noted above were assigned an important role in India's industrialisation. They were to produce various goods and services, in a scale and using technologies which were not done previously in the country. Initial mistakes in such new activities cannot be ruled out—in

fact these are quite common. It is difficult for such efforts to succeed unless one is willing to bear the costs of trial and error in terms of time, resource loss, etc. Such losses are in fact the short-term costs for the long-term benefits of not only self-reliance but that of efficient production. Ideally the persons involved in the projects should be given a reasonable time to deliver the goods. Hence it is important to plan for the future. During that time they need to be given the necessary facilities with the attitude that they would succeed, rather than questioning their potential every now and then. In particular they need to be protected against foreign interests. Since their output was meant to replace imports, international manufacturers who otherwise would find a larger market would be adversely affected. Naturally it would be in the interest of these foreign sellers and their Indian agents to see that such indigenous efforts do not succeed.

Indigenous efforts just like any other effort may not prove to be successful. But we are not aware of examples where such efforts failed despite the necessary support. On the other hand we can cite examples where PEs demonstrated their capabilities. However lack of proper planning, lack of support, indifference and even active opposition prevented the full indigenous potential from being realised. The experience of Planning and Development Division of FCI (P and D) would be a good case study to substantiate this.[3]

Experience of P and D

P and D started as the Technological Department of the Sindri plant of FCI to undertake routine maintenance and trouble shooting. Thanks to the initiative of the scientists and engineers, the activities of the department soon diversified. From the very beginning P and D demonstrated its competence in different areas connected with fertiliser production and research. For example, it started developing processes for fertiliser production and catalysts. P and D was among the few organisations to have a full range of catalysts. It also set up successfully nitric acid and calcium ammonium nitrate plants in Rourkela in the early 1960s.

In the late 1960s when the government decided to set up the Durgapur and Cochin fertiliser plants, P and D along with FACT Engineering and Design Organisation (FEDO) were appointed as the prime contractors with the responsibility of design-engineering, erecting and commissioning. The government insisted on large plants of capacity of 600 tonnes per day and above despite P and D's preference for more standard plants of smaller capacities. In fact such big size plants were new even by the international standards at that time [Ghosh 1986:700].

Despite certain achievements in terms of using more indigenous equipment, saving foreign exchange, etc,[4] some problems were faced [Ghosh 1986:700]. This is not unexpected. What was necessary was to give P and D the time to learn from experience and the opportunity to utilise such experience for setting up plants in future. The necessary time however was not available. The government failed to plan fertiliser production properly. Perhaps to compensate for its earlier inaction, the government decided to set up several other plants in the public sector in quick succession during the short period of about 10 years between the late 1960s and the late 1970s and appointed P and D as the prime contractor. Even before the trial runs began for the Durgapur and Cochin plants in 1972, the design-engineering of the plants at Barauni, Namrup II, Haldia, Talcher and Ramagundam were finalised and were at different stages of construction [Ghosh 1986:701]. Further the government did not go for standardisation in terms of scale of operation and feedstocks used. Except the Durgapur and the Barauni plants all these projects were dissimilar in terms of the scale of operation and the feedstocks used (naphtha, fuel oil, natural/associated gas or coal) [Dhar 1989: Chapter IV]. Hence on various basic aspects the process started anew. Past experience could not be fully utilised. The government started with 600 tonnes per day ammonia plant and soon decided to go for 900 tpd plants. In the 1980s when Thal Vaishet and Hazira plants were set up, government went in for even a bigger capacity of 1,350 tpd plants. And this time the government did not even short list the public sector engineering contractors, P and D and FEDO. Thus government decided not to use whatever experience was earned at P and D. It may be noted that despite the constraints mentioned above, the performance of the plants improved over the years. In fact the plants set up in the late 1970s (e g, Sindri modernisation plant, Nangal expansion plant, Neyveli fertiliser, etc) performed much better than the first generation ones [Ghosh 1986:701]. This turned out to be a controversial decision. Some have argued that government went in for the 1,350 tpd capacity plants to basically sidetrack P and D. There are indications to believe such allegations. Significantly enough, even internationally, 1,350 tpd were not yet the standard size. There are also international and domestic findings to suggest that the 1,350 tpd plants may not be cost effective.[6]

P and D in fact all through has been the subject of opposition from various interests. The government in the 1960s actively negotiated with an US firm, Bechtal, a proposal for giving them the main responsibility for setting up fertiliser plants in the country. If the conditions imposed by Bechtal were not so onerous,[7] then the Bechtal proposal may have materialised and naturally P and D would have had a much restricted role to play, if at all.

When the government approached USAID for aid for the Trombay fertiliser project in 1967, it imposed the condition that the job must be given to an American contractor on a turnkey basis and not to any indigenous contractor [Ghosh 1986:699-700].

The president of the World Bank in the late 1960s openly expressed his scepticism about India's technological and managerial competence to set up fertiliser plants [Dhar 1989:214]. World Bank holds no brief for indigenous efforts. There is in fact an in-built bias against indigenous enterprises in the World Bank funded projects. The World Bank insist on global tendering for selecting engineering contractors, suppliers of plant and machinery, etc. The bids are evaluated on the basis of price and/or competence. Regarding competence, the subjective assessment has often been the deciding factor. The World Bank would insist on comparison with international manufacturers. The less experienced indigenous firms would naturally be in a disadvantageous position particularly if experience of doing the latest things are insisted upon. They often cannot cite previous experience in their support. And the World Bank does not consider the potentiality—the fact that under certain conditions explained above the indigenous enterprises can also deliver the goods. It may be mentioned that P and D was actually appointed as the prime contractor for two World Bank funded public sector projects—Sindri modernisation and Nangal expansion. However the World Bank restricted the usual role of a prime contractor and insisted upon a larger role for foreign companies [Dhar 1989:237-39]. Several studies [Menon 1980; Dhar 1989:237-47] in fact have pointed out that the involvement of indigenous contractors and equipment manufacturers is significantly less in World Bank funded projects compared to those funded otherwise.

Since the 1960s it has been suggested on several occasions that FCI should be reorganised and P and D separated from it. This in fact was a major recommendation of the US team which came to India (as insisted by USAID and accepted by the government of India) to review the operations of FCI. This had all through been opposed by the supporters of indigenous efforts on the ground that research would suffer if de-linked from production units since the constant feedback would be absent. That there are other advantages of being a part of a larger organisation in terms of getting funds for research. That as a part of the company which is supposed to use the services, it would be more difficult to ignore the claims of P and D. Thanks ultimately to the support of some senior bureaucrats and technocrats, some of whom later joined organisations like Bechtal and the

World Bank, FCI actually was split into several companies in 1978 and P and D was de-linked from production units and reorganised as an independent firm, Fertiliser (Planning and Development) India, later renamed Projects and Development (India), [Ghosh 1986:701-4].

Other Examples

One can provide several other examples of how lack of planning, lack of support and active opposition have resulted in imports.

A Computer Group was set up under Electronics Corpn of India (ECIL) to manufacture computers. Mid-way however the government liberalised imports thereby making indigenous efforts superfluous. The company in fact suggested that the government should decide where it wants to develop indigenous technology and use it and where imports are to be permitted [CPU 1981a:48].

Centre for the Development of Telematics (C-DOT) is a good example of what government support can do and also the implications of absence of it. C-DOT was set up in 1984 to design and develop electronic telephone exchanges. The TNCs in the area together with some politicians and bureaucrats had all through opposed C-DOT. However initially it was able to withstand such pressures primarily due to the direct support provided by the then prime minister, Rajiv Gandhi, to Sam Pitroda and his team at C-DOT. It successfully developed the 128 line exchange in 1985, then the rural automatic exchange (RAX), which functions without air-conditioning and for which orders have been received from other countries as well. It also developed the 10,000 line exchange. C-DOT received international recognition for such achievements in such a short time in an area dominated by a few big telecom TNCs. At home however the opponents were not willing to provide the necessary encouragement and support to C-DOT to complete the final stage of the original programme, viz, the development of the 40,000 line main automatic exchange (MAX). The indigenous efforts were condemned as being too slow. They preferred off the shelf technology from the TNCs. Despite such obstacles, C-DOT ultimately in 1993 did develop the 40,000 line exchange though significantly behind schedule and short of some of the original specifications.[8] Meanwhile the opponents of C-DOT ultimately had their say—the Indian market has been thrown open to the giant telecom TNCs. Naturally the entry of these TNCs would be an obstacle to the further development of indigenous technology at C-DOT [*The Economic Times* 1991; Anand 1992, 1994; Chandra 1990:28; Aggarwal 1993].

The government has recently decided to import 6,000 HP electric locomotives worth $190 million from the Swedish TNC, Asea Brown Boveri (ABB). The government argued that to fulfill the targets of freight and passenger traffic in the coming years, Indian Railways would need ABB type high speed heavier engines with long haulage capacity and the country does not have the technology to produce them [Sanyal 1992]. The deal has become controversial with BHEL claiming that it can produce these 6,000 HP engines. A company spokesman pointed out that though Japanese collaboration is contemplated, at least 20 per cent indigenous technology would be used and with the transfer of technology, the engines would soon be produced indigenously [*The Statesman* 1992a]. It is significant that when tenders were first floated, ABB was not the lowest bidder. The railway ministry did not award the contract to the lowest bidder. Instead the ministry called for two more tenders, allowed protracted negotiations with companies with higher bids and ultimately selected ABB [Bhushan 1992]. The railway minister defended the decision to prefer ABB to BHEL basically on the ground that the ABB offer is cheaper and that the BHEL technology was untested. The finance ministry cleared the deal though a note prepared by its own department of economic affairs expressed strong reservations about the claims of the railway ministry. The note pointed out that the ABB technology was also untested and that the railway ministry evaluated the tenders on the basis of a higher exchange rate of rupee which implied a higher cost of the BHEL offer[9] [Chengalvarayan 1992].

BHEL was also involved in upgrading 5,000 HP engines. According to the Railway Convention Committee of Parliament, which probed the ABB deal, these engines could have been used for meeting at least the short- and medium-term requirements of the railways rather than importing the ABB engines at such a high price. The ABB locomotives would cost Rs 450 million each compared to the price of Rs 30 million for the indigenously manufactured locomotives of similar power (5,000 HP). The committee also recommended that indigenous R and D in the field should be strengthened and better engines developed in the future [*The Statesman* 1992b; *The Economic Times* 1992b].

It is significant that the government took hardly any initiative in the matter. Assuming that, as claimed by the government, the 5,000 HP ABB type machines are absolutely necessary to handle the projected growth in traffic, the government could have anticipated the growth in traffic. It could have undertaken an R and D programme and asked the public sector locomotive manufacturing/R and D units (Chittaranjan Locomotive Works, BHEL and Research Design and Standard Organisation) well in advance to develop the required engines. If despite the support, the latter had failed to deliver the goods within a reasonable time, then one can contemplate imports. Some efforts were made at BHEL But these too were ignored. It is significar that an expert in the field, A K Chattc padhyay, currently with the Indian Institut of Technology, Kharagpur, while admittin that there are certain techno-economic ac vantages of the ABB engines over the ur graded 5,000 HP engines being developed b BHEL, pointed out, "This does not mean tha I am advocating the controversial deal t import the ABB locomotives at an astrono mical cost. They could have been develope indigenously much earlier with a little fore sight and confidence in our own engineer This particular technology was among th projects discussed by the delegates of a na tional workshop on 'Power Electronics—Industry/Academic Interaction' held at IIT Kharagpur in May 1988. Further work o this in research and academic institutes an industries and production units was recom mended. But follow-up action by RDSO an the BHEL was too slow. It was finally aborte by the decision to import the locos [Chattopadhyay 1992].

III
Excess Capacity and Lack of Planning

Over the years PEs have created hug capacities in diverse fields. Due to import and inadequate investment in relevant ar eas, as discussed above, a significant pro portion of it has remained under-utilise [Department of Public Enterprises 1991 Vol 1, Statement 23]. The government o the other hand continues to incur expendi ture on new capital goods. A part of it is o course supplied by the PEs. One woul have expected the government to explor the possibility of utilising such excess capa city in the public sector to reduce the pur chases from others including imports. Th requirements of capital equipment in dif ferent PEs and other governmen organisations could have been identified i advance and the other PEs could have bee asked to see whether they can deliver thes goods, and if so, at what costs It is possibl that with marginal investments and give reasonable time they could have supplie competitive products. As we have explaine above, so long as the prices are higher tha the variable costs, it may pay to buy fro these PEs even if the prices are higher tha those available from others.

One can go a step further and argue th. even when PEs are unable to deliver th entire goods in the short run, the PEs ca use its bargaining power to make room fo a larger role of the PEs. For example, ONG is a major buyer of equipment from abroa By virtue of this, it can insist that PE should be involved as sub-contractors su plying a part of those they are capable o [CPU 1987a 96].

Such overall planning for the public sector as a whole is conspicuous by its absence. CPU (1987a) in fact has commented on "the absence of any long-term and perspective planning for the optimal utilisation of the facilities created at huge cost" (p 96).

Two major constraints on increasing public investment are availability of foreign exchange and problems of raising domestic resources in a non-inflationary way. A higher utilisation of capacities would lessen these pressures by reducing imports and by increasing profits.

An elaborate system has developed over the years for deciding public sector projects. Any major public sector project is finalised only after it is examined at different levels in different official agencies/committees of bureaucrats and ministers, e g, Public Investment Board, Plan Finance Division of the Ministry of Finance, Project Appraisal Division of the Planning Commission, Bureau of Public Enterprise, the administrative ministry concerned, the Cabinet, etc [Morris 1987].

There is however hardly any forum where an investment project is evaluated from the point of view of the public sector as a whole. Bureau of Public Enterprises was actually set up with the objectives, among others, of performing the function of co-ordinating PEs on important matters and of formulating policies for the public sector as a whole. However such objectives have basically remained unfulfilled [Economic Administration Reforms Commission 1984b:54-55]. BPE has hardly attempted the type of planning for the public sector as discussed above.

On the basis of the resources available, the Planning Commission provides estimates of sectoral output that are necessary to achieve the overall targeted rate of growth in the plan. These sectoral outputs and targets give the investment requirements in each sector. The public (as well as the private) sector projects are expected to be consistent with these sectoral estimates [Morris 1987.9]. Naturally if the extent of excess capacity in a sector is such that the anticipated increase in output can be taken care of, then extra capacities should not be set up if planning exercises are competent and strictly carried out. But the Planning Commission (or for that matter any other official body) does not consider whether the capacities set up for particular purposes and at present under-utilised, can be utilised for the new investments proposed.

In this context one may mention the new rail coach factory set up by the government at Kapurthala as an example of the government's inattention to the objective of profitability of the public sector as a whole. The factory commenced production in 1988 [Ministry of Railways 1990:33]. Railway coaches till then were produced by three other PEs, Integral Coach Factory, BEML and Jessop. The new factory with a capacity to produce 1,000 coaches per annum was justified on the ground that there is a huge demand potential. That there is need for increasing the number of coaches is not denied. But due to budgetary constraints the railways were unable to buy whatever these three PEs could offer. In fact the Kapurthala Factory made BEML apprehensive about their demand. Between 1979-80 and 1986-87, railways, e g, placed orders for only 297 coaches per annum on an average with BEML. Hence about 25 per cent of the installed capacity of 400 numbers of BEML remained under-utilised [CPU 1988a:54]. Even if purchase of coaches by the railways were to go up, the question remains whether it would not have been better from the point of view of profitable operation of the public sector to rely on the existing factories. Not only Jessop which has direct experience in manufacturing coaches, there are a number of other engineering companies, e g, Burn Standard Company and Bridge and Roof Company (India), which produce related products like wagons for the railways. A basic problem of these units is under-utilisation of capacities. It would have been naturally much cheaper to use the infrastructure already available to expand/diversify to meet the requirements of the railways rather than setting up a green field project.

IV
Private Interests

Persons running PEs have very often used them to further their own private interests rather than that of the enterprises. The reports of the CPU can be used to identify concrete instances.

Two sick tannery units of a private firm were taken over in 1969 to form Tannery and Footwear Corpn of India (TAFCO). CPU (1981b) reported that though the dues were promptly paid to the erstwhile owners, the assets of the firm including trademarks were yet to be legally transferred to TAFCO due to some disputes. The TAFCO management went out of its way to keep the claims of the ex-owners of the firm alive. This directly went against the interests of TAFCO since it could not take any legal action against the widespread misuse of its trademarks by others which took place during the long period.

Central Inland Water Transport Corporation (CIWTC) sold many vessels which were very much in running condition, at a fraction of the market price. CPU (1978a) narrates how a handful of top officials of CIWTC in collaboration with the buyers manipulated the entire sale procedure to derive private monetary benefits at the cost of the company. In one case, the company sold a vessel for just Rs 0.31 million after spending Rs 1.33 million on repairing it. The replacement value was estimated at Rs 8 million.

Again CIWTC imported seven vacuvators. CPU (1978b) pointed out that due to private motive, two top officials of the company did not explore lower cost alternatives. Indigenous manufacturers were contacted but effectively by-passed. The CPU quotes from internal notes of the company officials to show how negotiations with indigenous manufacturers were delayed as a part of the strategy to justify imports which would be quicker. Use of vacuvators owned by the Food Corporation of India was also not explored. CPU also pointed out that the vacuvators were probably not new but reconditioned ones. The engine numbers quoted by the suppliers did not tally with the numbers actually given in the vacuvators. Moreover there were frequent breakdowns.

The Trombay unit of the FCI entered into an agreement with a foreign firm for the supply and installation of ammonia, urea and nitric acid plants. The foreign firm could not start the plant in time and FCI made a claim for compensation for the delay. Despite the opinion of the general manager and the legal advice taken that the company stick to its claims, the company withdrew the claim on the ground that a compromise would be better than going in for arbitration. The managing director who withdrew the claim and signed an agreement for a much smaller compensation left the company soon after and joined the same foreign company as consultant. CPU (1969) commented that "the managing director did not act entirely in the interests of the corporation" (p 9).

Stealing of coal and other malpractices in the coal fields are well known. CPU (1981c), e g, commented, "An in-depth survey of malpractices in Dhanbad coal field area by CBI teams has brought to light several malpractices in sale and movement of coal, award of contracts and purchase orders, reporting of stocks, etc. Involvement of senior officials of coal companies is clearly indicated" (p 48). Such private gain is a major factor behind the public sector coal mines' losses.

Similarly theft of power has reduced the revenues of state electricity boards. It has been estimated that about 5-10 per cent of the electricity generated has been lost due to unmetered use (theft) and also due to inadequacies in the distribution system [Surrey 1988:369].

V
Apathy

That things may go wrong is of course not unexpected. What is important is to take corrective action. The reports of the CPU however have highlighted over the years instances of government's inaction and apathetic attitude.

After examining Biecco Lawrie, the CPU came to the conclusion "that it is a case of utter neglect, indecisiveness and apathy both

on the part of the undertaking as well as the government" [CPU 1988c:74]. The government did not close down the unit or merge it with another healthier company as recommended by an official committee. Neither did it commit itself to any concrete plan of action for the revival of the company. In fact the CPU (1988c) reported that the government did not even approve the micro-objectives of the company on the ground that its future is undecided.

Another CPU came to a similar conclusion regarding Khetri Copper Complex: "An in-depth study of the Khetri Copper Complex has brought to light among other things, that the administrative department of the government was more or less passive witness to the bad performance almost throughout" [CPU 1981d:44].

The Surgical Instruments Plant under the Indian Drugs and Pharmaceutical has been incurring losses since its inception in the early 1960s. There is practically no demand for its product: it can produce instruments based on Russian design but the surgical profession in India is used to western designs. It employs more than 1,100 persons out of which 50 are utilised in general engineering side and 150 in the pharmaceutical formulation unit, which was set up later. The remaining 900 persons are without work: they come and literally sit and go back. Possibilities of utilising the surplus staff in other PEs, e g, HMT and Bharat Electronics were explored but no concrete steps have been taken as yet [CPU 1987b:77].

Jessop complained to the CPU that lack of demand is a major problem. But even when they manage to get orders, shortage of working capital prevents them from making full use of the situation [CPU 1982a:2]. The government ultimately is forced to provide may be larger amounts of money to finance the loss, which further increases costs due to the interest burden. Instead if initiative were taken to provide/arrange working capital beforehand, then losses and costs would have been less.

A factory was set up at Gaziabad under Bharat Electronics primarily for manufacturing specific defence equipment. After the commercial production was started, the defence ministry changed its purchase plan and stopped buying, rendering thereby the capacities created superfluous. The company, like a private sector firm if similarly placed, sought compensation from the government for not honouring its commitments. Of course for the public sector as a whole intra-firm compensation does not mean much. But what is worth mentioning is the lackadaisical attitude of the government. It not only denied compensation but argued that "problem of under-utilisation of capacity should be treated as a normal production problem [CPU 1986:101].

VI
Summary and Conclusions

The sharp fall in public investment in absolute terms (at constant prices) in the late 1960s and the stagnation in absolute terms till the mid-1970s was a severe blow to the growth of PEs. Particularly so because it happened at a time when manufacturing PEs were still in the formative stage. The fall in public investment implied a fall in the demand for many PEs producing capital goods. With PEs themselves the major/sole buyers of many capital goods from other PEs, demand naturally appeared as a major problem. The fall in demand by reducing profits and hence resources for investment, had a further depressing effect on public investment (Section I).

In absolute terms public investment recovered by the mid-1970s. But by then the structure and the character of public investment had changed. Investment in an important sector, viz. railways remained depressed all through. In accordance with the priorities in the Second and Third Five-Year Plans, steel and heavy engineering received the bulk of the government's investment funds. But the allocation in these sectors went down subsequently creating problems in other sectors which developed to cater to the former's requirements. On the other hand increases in investment, e g, in a number of the services sector generated hardly any demand for the type of machine building capacity India generated. Moreover despite domestic availability, capital goods and technology began to be imported (Section I).

Imports have taken place under different circumstances. In a number of cases the PEs were denied the opportunity to even compete against imports as, e g, in bilaterally aided projects. In other cases imports have been justified on the ground that the PEs were given the opportunity but they could not compete against the foreign manufacturers. But depending on the variable costs of production, it may be more profitable—from the point of view of the PEs as a whole—for a PE to buy costlier goods from its sister PE. Such impact on the profits of the PEs as a whole was not considered. Non-price factors such as delivery time, quality, reliability have been cited more often than the price factor in defending imports. But our examples in fertilisers, electronic telephone exchanges and electric locomotives show that the capabilities of PEs were often not recognised or further developed paving the way for imports. Lack of proper planning, lack of support, indifference and even active opposition prevented the full indigenous potential from being realised (Section II).

Due to such imports (and also inadequate investments in relevant areas) a significant proportion of the capacities created over the years in the public sector has remained unutilised. The requirements of capital equipment in different PEs and other government organisations could have been identified in advance and the other PEs could have been asked to see whether they can deliver these goods and if so, at what costs. It is possible that with marginal investments and given reasonable time they could have supplied competitive products. One does not observe such overall planning for the public sector (Section III).

The inadequate and *ad hoc* public investments and the under-utilisation of public sector capacities discussed in sections I to III reflect to a large extent the situation that those who control the PEs do not have efficient operation of the PEs as their major objective.

The shares of the central government PEs are held by the president of India. On behalf of the president, the central government not only appoints the board of directors, the chairman, the managing director, etc, to run the enterprises. It also exercises control in different formal and informal ways. The PEs are required to get a host of approvals from the government, e g, regarding investments, pricing etc. In addition the government calls for different types of information and gives instructions/suggestions. These are done not only in writing but also verbally. It encompasses the entire range of operation of the enterprises, e g, awarding contracts for purchases, dealership, etc [Economic Administration Reforms Commission 1984b:51,75; Economic Administration Reforms Commission 1984c:22-23]. Hence PEs may be considered to be controlled by the ministers and bureaucrats—representing the government—and the top management.

A necessary condition for the profitable operation and the growth of the PEs is that those who run them should be interested in such objectives. We have indicated a number of cases where the top management of the PEs have used them to further their private interests rather than that of the enterprises (Section IV). Such private interests have operated not only at the firm level. There are reasons to believe that some top level decision-makers in the government have also used the PEs to further their own interests. Imports provide one such opportunity. Foreign manufacturers are naturally interested in pushing their products into India. Reportedly it is quite common for them to bribe influential persons to secure the order. Once this is realised it may not be difficult to understand why the capabilities of PEs were often not recognised or further developed, why indigenous efforts were often opposed and imports were preferred. Circumstantial evidence suggests that the lure of private financial gain on the part of some decision-makers may have been an important factor in such matters.

Since powerful persons are involved, it is difficult to get hard evidence. But newspapers occasionally contain reports and comments about such manipulations. The Central Bureau of Investigation recently filed a case against V Krishnamurthy (a former secretary to government of India, former member, Planning Commission, former chairman of two large PEs, Maruti Udyog and Steel Authority of India) and some of his associates for allegedly receiving commissions from foreign companies in connection with the latter's transactions with some PEs [*The Economic Times* 1992c]. Another significant news item recently was the arrest of a businessman by the directorate of revenue Intelligence of the central government. He is reported to be very close to a union minister. His job was to secure global tenders for foreign companies and act as commission agent between the supplier and the concerned minister and some bureaucrats [*The Economic Times* 1994]. Again a reputed columnist, Nikhil Chakravartty (1992) while commenting on the imports of locomotives from ABB by Indian railways pointed out that "there is very little room for doubting that a magnum-size kickback was involved in the deal".

Apart from private financial gain, the top decision-makers have used PEs for a number of other objectives not connected with the interests of the PEs.

The level of public investment depends to a large extent on the resources mobilised and the tolerance limit of the government regarding inflation. Sluggish public investment which had a negative impact on the PEs, is basically explained by the inability/unwillingness of the government to raise resources and to face a higher level of inflation. The ways of raising resources to finance investment in a non-inflationary way are well known. The fact that the politicians in power did not adequately resort to such measures as taxing the rich farmers and landlords, the unaccounted income, etc, implies that they were more interested in preserving the interests of these prospective taxpayers rather than the growth of the country and the PEs. The lower the mobilisation of domestic resources, the higher was the tendency to seek foreign assistance. Foreign fund agencies more often than not insisted on imports and deprived the PEs of the market.

The pattern of public investment changed significantly particularly after the mid-60s to the detriment of the growth of many PEs. Increasingly investment allocation served the political ends of the decision-makers rather than the growth objectives of the PEs [Economic Advisory Council 1987:5-6, 13; Jha 1985: viii]. The government, e g, set up a new rail coach factory at Kapurthala, which was the Lok Sabha constituency of a close associate of the then prime minister. If the profitable operation of the public sector were the main consideration, then it would have been better to expand/diversify some existing PEs which produce similar goods but currently are suffering from the problem of demand. Morris (1990) found that one of the important reasons for cost and time overruns of public sector projects is the inadequate funding of the projects. Due to political expediency the government has a tendency to spread its resources thinly over a larger number of projects.

We have also highlighted several instances of the government's inaction and apathetic attitude (Section V). We discussed that while deciding the investment and imports of individual PEs, the government did not bother about the long-run implications and the impact on the profits of the PEs as a whole. Lack of co-ordination between PEs and planning for the PEs as a whole has been conspicuous by its absence. Such crucial decisions were not taken not necessarily due to private gain on the part of the decision-makers. It could be a reflection of the degree of importance attached by them to the PEs. They may have been pre-occupied with other matters.

Thus we would like to conclude that a basic factor explaining the disappointing performance of the PEs in India has been that those who control PEs were often either not interested in them or pursued their own objectives when they were interested. Top government functionaries including the prime minister directly participate in the decision-making process when they independently or through different committees, e g, the cabinet meetings take decisions, say about major investments, pricing, etc. The prime minister directly or indirectly appoints all others involved in decision-making—chairmen, managing directors, bureaucrats and other ministers. Hence we can say that the objectives with which the PEs are run ultimately reflect the priorities of the top political authority.

Obviously these objectives are not the sole determinants of the performances of PEs. A private firm does not necessarily succeed even when those who control it try to maximise its profits. Similarly there is no guarantee that PEs would necessarily respond to a more congenial environment. However there is no *a priori* reason either why PEs should not perform better if they are run with the objectives of efficiency and growth.[10]

Notes

[The paper is a revised version of a Working Paper of the Indian Institute of Management, Calcutta, issued in June 1993. The author thanks A K Bagchi for discussions, D Bhattacherji and B D'Mello for comments and in particular R Nagaraj and S Morris for discussions and comments. They do not necessarily agree with the opinions expressed. Financial assistance from CMDS, Indian Institute of Management, Calcutta, is gratefully acknowledged.]

1 During the First Five-Year Plan period, 29 per cent of the public sector outlay was spent on irrigation and power and 27 per cent on transport and communication. Funds spent directly on industry and minerals were relatively small (4 per cent) [Planning Commission 1961:33].

2 It would have been better to consider the figures for gross fixed capital formation. But these are not available at constant prices for railway investments. However, given the distinct long-term pattern, gross domestic capital formation can be treated here as a proxy for gross fixed capital formation.

3 For this case study we have primarily relied upon Dhar (1989: Chapters 3-6) and Ghosh (1986).

4 The foreign exchange component of the total project cost were estimated to be 35 per cent for the Durgapur plant compared to 60 per cent for other projects set up in the late 1960s [Dhar 1989:139].

5 As just mentioned, the Barauni plant was taken up before the Durgapur plant was completed and hence the experience of the latter could not be utilised.

6 Out of the total installed capacity of ammonia plants in the world, the share of 1,350 tpd plants and above is only 25 per cent. About 58 per cent of the capacity were for the 900-1,000 tpd range [Dhar 1989. 263-64] Again an UNIDO study cited by Dhar (1989: 272) shows that at 80 per cent capacity utilisation, 900-1,000 tpd plants would be more cost-effective

7 Bechtal insisted it should be granted 49 per cent participation, guaranteed profits, right to supply India the crude oil to be used as the raw material, etc [Ghosh 1989: 699].

8 The MAX developed by C-DOT can take only three lakh call attempts in an hour compared to the Department of Telecommunication's target of eight lakh calls. In a press interview, the executive director of C-DOT admitted this shortcoming but pointed out that the exchange meets the international norm and in fact compares favourably with that of the French TNC Alcatel's E-10B exchanges working in India [Aggarwal 1993].

9 The railway ministry used the exchange rate as on June 26, 1991, i e, the date of opening the tender. But as per the guidelines of the Asian Development Bank, which financed the purchase, if the exchange rate as on December 24, 1991 is used then the BHEL offer would actually be cheaper.

10 In this context we note that privatisation of PEs has often been recommended on the ground that it will eliminate the political and bureaucratic interferences and hence take care of a basic constraint faced by the PEs (see, e g, S A Aiyar, *The Economic Times*, Calcutta, March 8, 1993). A discussion on it is beyond the scope of the present paper. However, it may be mentioned that such prescriptions do not allow for the possibility of change of priorities of the political authority. Moreover, privatisation may eliminate the political and bureaucratic intereferences as argued by Aiyar. But as pointed out by Nagaraj (in the same issue of *The Economic Times*), depending on the market structure, quality of management, etc, the situation may not necessarily im-

prove. The rents now enjoyed by the politicians and bureaucrats may be replaced by private monopoly rents. To fully assess the feasibility and effectiveness of privatisation, it is also important to examine the business environment and the nature of the operation of the private sector in India.

Backward Communities and Migrant Workers in Surat Riots

Irfan Engineer

In the riots in Surat that followed the demolition of Babri masjid on December 6, 1992, the BJP and Hindutva forces had the backing of the migrant Hindu communities in the city. These upwardly mobile communities were looking for a broader identity and a larger political role, which the Congress had failed to provide. The BJP attempted to fill this vacuum and, therefore, had the resources of these communities at its disposal.

THE communal riots which broke out all over the country after the planned demolition of Babri masjid in Ayodhya on December 6, 1992 found their most barbaric expression in the industrial city of Surat. Hundreds of people belonging to the minority Muslim community were done to death in an extremely cruel manner, women were subjected to repeated rapes and were humiliated by hoodlums of organised communal outfits like the BJP, VHP, Shiv Sena and Bajrang Dal, and property owned by members of the minority community worth crores of rupees was systematically looted or destroyed. The consequences of riots continue even today and a sense of unease prevails among the Muslims of Surat.

While the element of shock and anguish was common to incidents of communal riots in different parts of the country and Gujarat, the riots in Surat gave rise to another question. How and why did the riots break out in Surat which was known for its communal harmony and peace?

Riots in Surat were preplanned by the BJP with help from other Hindutva forces. While the general purpose of these riots was to communalise Hindus and prepare them for control over the state apparatus by Hindu fascist forces, the immediate purpose in Surat was to win municipal elections, which were due to be held soon, by translating Hindu fears after riots into a vote bank for the BJP. The riots were not unexpected on account of the vicious and vigorous communal campaign being carried out in the country in the immediate past. However the extent of spontaneous participation by different sections in the riots was not imagined even by the BJP. Large-scale participation of migrant workers and the role played by rumours in mobilising the mobs on the streets were crucial factors. The police were either absent or inactive. In some cases the police even abetted the rioters, anti-social elements actively participated in the riots as the police looked the other way. Muslims provided the necessary spark by giving a bandh call to protest [illegible] BJP harnessed [illegible] due to anger, frustration [illegible] support for elections. Kathiawadi workers indulged in raping women on an unprecedented scale, partly to vent their sexual frustration and to demonstrate their power over middle class women and partly in retaliation of the rumours about rapes of Kathiawadi women in Sayyedpura. Rioting took place mostly in middle class societies and RCC concrete houses. There was hardly any violence in the slums. In spite of the communal outbreak, solidarity and mutual help cut across communal as well as class lines. There was a marked difference between the first phase and the subsequent two spells of rioting. While in the first phase rioting took place mostly on the outskirts of the city, with participation of large number of migrant workers and the Muslims by and large on the receiving end, subsequent spells of rioting occurred within the walled city and in Rander, with local Surtees participating. The Machhi and the Kharwa youth participated with all the militancy and solidarity at the command of the community. Here some local factors also played a significant role which was by and large absent in the first phase of rioting. In the later period of the second spell of rioting Muslims resorted to revengeful actions like throwing bombs on Kathiawadis and setting fire to the slums of the Oriyan workers. The third spell of violence was caused by the Hindutva forces' attempt to cash on an opportunity and give it a communal turn. The secular forces were totally absent from the scene as the city is yet to witness strong working class movements and organisations on class lines. The conservative but prospering middle class and the rising castes are subscribing to the Hindutva ideology and so there is little hope from these sections to support the cause of democratic and secular forces. The role of the media in supporting and propagating the assertive 'cultural nationalism' of the Hindutva is considerable.

Since much has already been written about Surat riots, the details of events will not be recalled here. In this article I propose to examine the background of the city in the first part. In the second part, I will describe the hold of communal politics on Gujarat and its impact on Surat and examine why the BJP could develop a strong network in Surat with the help of upwardly mobile Rana, Ghanchi, Kharwa and Machhi communities. I will also investigate how the Congress has lost credibility amongst the people in Surat and did not counter BJP's propaganda. In addition I will describe the Muslim communities of Surat. In the third part, I will focus on the conditions of the migrant workers.

I
Surat City

It was in 1795 that there were riots in the city for the first time. The riots occurred between the bania community of traders and Muslims because of traders' support to the British. The British gained control over the city but gradually shifted trading activities to Bombay. As a result, the importance of Surat as a port began to decline. While the Hindu merchants of the city entered into new relations with the British and adapted to the changing conditions, the Muslims, who identified with Nawabs, could not do so.

Before the British rule in India, relations between the Hindu and Muslims were cordial in Surat because of their interdependence in economic activities. However, the British administration brought about many changes which strengthened caste/communal bonds among people. The British encouraged and welcomed delegations as well as representations on the basis of caste and community. Not surprisingly, the opposition to British policies by different elites also asserted itself in terms of the caste/community interests that the elites claimed to represent. While it divided elites along caste/communal lines, it also strengthened the caste/community basis of ties and laid the foundation for inter-community rivalries.

After independence, Surat made rapid economic progress with the growth of small-scale industries and informal sector in the city. Several factors account for this growth. Oil exploration at Hazira and natural gas exploration, a few kilometres away led to the establishment of big projects near Surat. The city is well connected by rail and road to other major cities like Ahmedabad, Baroda, Bombay, Calcutta and Madras. The state government encouraged small-scale units and the informal sector in Surat. The transport network and cheap labour contributed to these developments. The crisis in some industries, especially in textile industry in Bombay and Ahmedabad, also led to their shift to Surat.

A large volume of industrial production in Surat is exported. Zari, powerlooms and diamonds are major industries. These have attracted a large number of workers from

other parts of the country as well as the state. Due to this migration, the population of Surat has increased phenomenally from 8 lakh to 1.8 million between 1981-1991.

Industries in Surat

Surat produces 40 per cent of total yarn in the country. It also accounts for 40 per cent of the entire production of synthetic textile in the country. It has more than 2.5 lakh powerlooms (about 50 per cent of total powerlooms in the country). The industry employs more than 30 per cent of labour force of the city.

There are about 250 medium- and large-scale dyeing units. They employ about 30,000 workers. There are many export-oriented ready-made garment manufacturing units. Diamond industry in the city employs more than 4 lakh workers. It contributes more than 80 per cent of total diamond exports from India. The diamond exports from Surat are worth more than Rs 3,000 crore annually. The workers as well as owners are from Kathiawad (Saurashtra) while distributors are mostly from north Gujarat.

Zari (gold thread) was once a major industry of Surat. In 1927, it employed 20,000 workers and produced output worth Rs 80 lakh. Later, with the emergence of textile and diamond industries, it was relegated to third position. According to 1971 census, there were 300 big and 800 small producers in Zari industry. It employed 30,000 workers and exports amounted to Rs 7 crore annually. However, of late the industry is facing threats from units producing artificial gold thread.

Though Surat is dominated by small-scale units, it ranks next only to Ahmedabad in collection of income tax in Gujarat. As per 1971 census, while its population was one-third of that of Ahmedabad, its income tax collections amounted to about one-half of the collections in Ahmedabad.

The growth of industries in Surat has been haphazard. Unlicensed and unregistered units abound. Today, nobody is in a position to give a reliable estimate of numbers of operating units in the city in different industries. Many household units are in remote areas and slums. Labour laws are unheard of and workers are paid on the basis of production. All means are employed to squeeze out maximum labour power of the workers by paying extremely low wages. There is no security of work. Workers are freely hired and fired by owners of industrial units. Industrial regulation laws are rarely implemented. Ruthless exploitation of labour forces them to live in abysmal conditions.

The lumpen entrepreneurs of the city want quick returns by any means, fair or foul. In search of super profits, lumpen capital organises large-scale evasion of octroi, excise and sales tax. This is so common that it hardly raises any eyebrows in Surat. There are organised gangs with sufficient muscle power and powerful connections to help in evasion of octroi for a price. These gangs earn lakhs of rupees daily from octroi evasion alone! The super profits of lumpen capital further thrives on thefts of electricity. The unregulated and illegal units are hardly known to get legal electric connections. However, even the registered factories pay the Surat Electricity Company employees to connect their wires, bypassing the meter. Boom in land prices partly reflects this aspect. Land prices in Surat are comparable to those of Bombay! Affluence has increased. While the working class lives in poor quality, over-crowded shelters with dirty surroundings and the number of high-rise building in affluent parts of the city, Athwa Lines and Ghod Dod Road, is growing. There are expensive parlours, restaurants and shopping plazas for the rich. The builders' lobby has become rich and powerful. According to one builder, there is a slump in demand of housing from the middle class. Builders are now concentrating on either low-cost housing (price less than Rs 1 lakh) or elite-housing (costing more than Rs 20 lakh per flat) with modern amenities. The strong lobby of builders has not only pushed up the price of land exorbitantly but has also encouraged land sharks with muscle power to grab land.

The lumpenised capital needs organised muscle power and criminal gangs for its immoral and unregulated growth. The crime rate in Surat is very high. Of late, the city has begun to attract attention of Dawood Ibrahim even as Latif gang from Ahmedabad already has its hold over the city through its liquor distribution network (in spite of prohibition). Thefts and dacoity incidents occur frequently due to 'Chaddi Baniyan Dhari Gang', allegedly of migrant labourers from Orissa and Banda district in UP. The gang is notorious for attacking almost one flat every day and terrorising its occupants. One columnist, Hakumat Desai wrote in his column in *Sandesh*, a daily in Gujarat, that according to available statistics, almost one-eighth of residents of Surat are rapists! Workers, especially Kathiawadis, staying away from their families for long, are sexually frustrated and frequently visit prostitutes. AIDS is making rapid inroads among them. 'Supari' contract for murders are also common.

A few incidents will illustrate the magnitude of criminalisation in Surat. Recently in Bombay, when a prisoner was taken to the J J Hospital for treatment, he was shot at, allegedly due to rivalries between gangs. The killers were also injured in a shoot-out with the police party guarding the prisoner. Later they were brought to Surat for shelter and clandestine medical treatment. They were arrested under TADA, along with the doctor treating them, from Surat. One Mahendra Choudhary, became a famous blackmailer and supari (contract) killer. He is alleged to have links with a number of politicians. When the police arrested him, he threatened to expose their misdeeds. Subsequently, he was shot dead by the police while he was being taken for investigations. The police justified the killing on the ground that he was trying to escape. The smugglers of Porbunder are known to hide in Surat because of its safe underworld network.

Thus, in Surat, extortion, blackmailing, protection money rackets, thefts, rapes, eveteasing, 'tackling' the agitating workers in exploitative informal and unorganised sector, liquor trade and organised evasion of octroi and sales tax, are common activities yielding high profits.

In recent times, the links between politicians and criminals have strengthened. A large amount of black money from criminal activities finds its way into pockets of politicians to buy patronage. Now, criminals run their own political outfits. Shiv Sena and Bharatiya Minorities Suraksha Mahasangh (BMSM) eloquently reflect this tendency.

The growing power of criminals in politics is also influencing the leadership of parties like the Congress and BJP. The old leadership, which is not so dependent on criminals, is being pushed out. They are being replaced with the new breed of politicians with direct and strong links with criminals. Sometimes, leaders themselves are established criminals. The lone Congress MLA from Surat has a reputation of being a land shark with strong connections in the underworld. Similarly, the BJP is trying hard to draw gangs wielding muscle power into its fold. Its influence over the state machinery and particularly the police has attracted criminals to the BJP. Recently, one BJP leader, one of its candidates for Surat municipal corporation elections, was accused of possessing an unlicensed revolver and several cartridges, by the police. Hindu anti-social elements are also moving close to the BJP. Guns and arms are freely available in Surat. A few months ago, the police stumbled upon a racket of issuing fake licences in which several politicians, criminals, and builders were involved. Two film producers from Bombay had obtained fake licences through the racket. Police constables and inspectors pay Rs 2 to 5 lakh for prized postings in the city. These are among the highest rates for transfer of posting. Yet, this money is recovered within a year or two!

Thus Surat, growing at the fastest rate in Asia is a city with unregulated growth of small-scale industry and lumpenised capital, generating a high proportion of black money. In turn, this accounts for high crime rate in the city as well as the all-pervasive control over it by different criminal gangs.

II

Communalisation in the Country and Its Impact on Surat

The communal propaganda unleashed by the forces of Hindutva found fertile ground in Gujarat. In fact, Gujarat has become the bastion of Hindu communal forces. These have steadily increased their strength ever since the formation of Jan Sangh. However, it is not only communal fascism which is asserting itself in isolation. In the society itself there are fascist tendencies. The brutal suppression of dalits and tribals in Gujarat is far more inhuman than in other regions. In such a conservative and fascist ethos, communal fascism of the upper-caste Hindus quickly gained ground with forces of Hindutva providing the ideological justification for such tendencies and practices.

The explanation for these tendencies has to be historically located. "The western Gujarat is surrounded by Arabian sea. First Cambay and later Surat served as important ports. It was situated roughly midway between markets of China and south-east Asia" [David Hardiman: *Penetration of Merchant Capital in Pre-Colonial Gujarat*]. Historically, Gujarat has had flourishing trade and a prosperous class of traders. The size of this trading class has grown significantly in the last four decades. These traders with a conservative and orthodox outlook have traditionally provided the political base for the BJP. The trading class and the rising middle classes always clamour for stability and faster growth. This is the root cause of the tendency to brutally stifle any voice of dissent, which is viewed as an uncertainty that can hamper stability and growth. As mentioned earlier, it is this conservatism and the authoritarian tendencies in the society that nurture communal fascism.

There are other, geographical and historical, reasons for steady growth of communal fascism on the fertile soil of Gujarat. Gujarat shares its borders with Pakistan. Some agencies in Pakistan are trying to supply arms to terrorists in India. The Rann of Kutch, bordering Pakistan and the coastal belt of Saurashtra have proved ideal for such activities. The media in Gujarat has widely publicised this fact and magnified its dimension, giving it undue importance. The neo-literates and the rising middle class/caste read such news with keen interest thus increasing the circulation of the newspaper concerned. The state government, too, in order to divert the attention of the people from the problems of the day, gives misleading statements that create apprehension in the common man about the all-pervasive Pakistan terrorist. The common Hindu sees Muslims as the natural allies of Pakistan. They are suspected of clandestinely helping Pakistan in smuggling of arms into India. Even during the Indo-Pak war of 1965, there was a widespread suspicion that the Muslims were sympathetic towards Pakistan. The BJP and other forces of Hindutva exploit such popular perceptions and beliefs to portray Muslims as anti-national and pro-Pakistan. This common misconception benefits all the ruling class parties, including the Congress, and hence instead of clearing such misconceptions, they are sought to be strengthened.

The bankruptcy of the Congress has led to disillusionment of an increasing number of people in the state. Ordinary people had been mobilised for anti-price rise movement and anti corruption movement, like Nav-Nirman, against the Congress. In such a crisis, to maintain its hold over the people, the Congress reformulated its strategy and came up with the slogan of kshatriya, harijan, adivasi, muslims (KHAM) alliance. This led to widespread resentment against the members of these groups in the conservative Gujarat society. In the state, there have been violent anti-reservation movements. Gujarat perhaps is a unique state in which the anti-reservation agitation of 1985, which witnessed brutal anti-dalit violence by the upper castes, could later be converted into communal riots between the dalits and Muslims. The people of Gujarat, tired of the corrupt Congress rule, are increasingly turning towards the BJP as an alternative to the Congress.

Propaganda Machinery of BJP

The BJP has gradually built a strong party organisation and political support base in Gujarat by taking up various socio-economic issues affecting the people. For the last Lok Sabha elections, it depended heavily upon the Ram Janmabhoomi issue. Frequent communal riots, systematic campaigns against Muslims and for building the Ram temple in Ayodhya by the BJP-RSS-VHP combine at all levels, with active participation by other religious preachers and saints, created a near hysteria in the society. Due to this hysteria and its role in the Nav Nirman movement as well as reservation agitation and communal riots, the BJP won elections of Rajkot and Ahmedabad municipal corporations. It also intermittently ruled Surat and Baroda municipal corporations [Ghanshyam Shah: *Islamic Perspective*, June-July 1992]. In Ahmedabad it utilised its control over the municipal corporation to demolish the shops and houses in Raipur-Dariapur area, out of communal bias (as it is a locality with considerable Muslim population). Naturally, seeing the communal bias of demolition squads of the BJP-controlled corporation, the anti-social elements from the community retaliated and thus strengthened the hands of the now underworld don of Ahmedabad—Latif. Latif received patronage of some Congress ministers who even utilised his services to finish their opponents within the party. The BJP, with its highly efficient propaganda machinery, immediately proclaimed that Congress was protecting Latif merely because he was a Muslim. They also branded him as anti-national. The insecure Muslims began to see Latif as their protector. The BJP's propaganda slowly created a belief that the Muslims are anti-social elements and stockpile a lot of weapons; that they smuggle arms and drugs and are therefore also anti-nationals. Some of the important issues highlighted by the BJP in its propaganda and the activities of forces of Hindutva may be summed up as follows:

—Numerous rath yatras in the name of religion are carried out not only to generate high-pitched and vulgar propaganda against the Muslims but also to provoke them into starting riots. These rath yatras almost always create tension and many riots in Gujarat have been sparked by them. For example, according to newspaper reports at least 34 people were killed in Gujarat in the aftermath of L K Advani's rath yatra in October 1990.

—Communal programmes such as 'Ramshila pujan' (collection of consecrated bricks and donation for Ram temple in Ayodhya) and 'Ram paduka pujan' were carried out widely, covering even remote tribal villages.

—Provocative slogans were written on walls at the time of 'ekta yatra', 'kar seva' and other yatras.

—False propaganda of the Hindutva forces was never countered by the other parliamentary parties and secular forces.

—Saints of various sects, who wield considerable influence among the people, came together and unitedly campaigned for Ram mandir and dubbed the Muslims as anti-nationals. They gave a call for Hindu unity, asking the people to forget all caste differences for the sake of the nation.

—Hindu religious festivals were liberally financed and celebrated with pomp and show. Even festivals of different sects were celebrated by the people of other sects to create the atmosphere of a united Hindu platform.

—Communal riots were planned to create hatred against Muslims and insecurity among Hindus.

—Anti-reservation agitations of 1981 and 1985 were turned into Hindu-Muslim riots. These riots even spread to some rural areas, according to Ghanshyam Shah.

—The BJP projected its version of 'Ram rajya' as an alternative to 'goonda raj' of the Congress and its appeasement of the Muslims.

—There is an attempt to change the name of Ahmedabad to Karnavati. This was widely and repeatedly propagated with the full support of the local media. People are fed up with goondas, corruption, price rise,

unemployment and other election strategies and cynical calculations. The people, especially traders and middle classes, want an authoritarian regime to change all this. In this context, the Hindutva forces have managed to garner support and develop roots in Gujarat by giving their campaign a moral, nationalist and patriotic colour.

Sardar Patel is being portrayed as the 'iron man' who stood for Hindu values in Nehru's cabinet. It is not without significance that L K Advani began his rath yatra from Somnath temple in Gujarat. The restoration of the Somnath temple after independence was deliberately taken out of context and at the time of rath yatra, it was extensively propagated that 'lokhandi purush' (iron man) Patel got the temple reconstructed and thereby restored the glory of Hinduism!! According to the Hindutva propaganda, had he been alive today, he would have definitely got the Ram mandir built at the very spot where Ram was born (where the Babri masjid stood)!!

The Congress and its leaders at different times have used religious symbols to take advantage of people's faith in religion. The BJP-VHP-RSS combine is carrying out this game further and distorting history in a systematic manner. In step with this campaign, the BJP has increased its support base in Gujarat. Today, the BJP has 69 seats in the 182-member state assembly, including four out of six seats which it won in by-elections held in May 1993. It not only retained Jambusar and Gadadha assembly seats but also snatched Rapar and Ellisbridge seats from the ruling Congress. Kashiram Rana and other BJP leaders promptly claimed that the results of these by-elections reflected the victory of BJP's Ram rajya over goonda-raj of the Congress.

In the last assembly elections, the BJP had an electoral alliance with Janata Dal. The united opposition enabled it to win 69 seats as against 30 seats won by the Congress, in an anti-Congress wave among the people. Later, a coalition government was formed in the state with Chimanbhai Patel as the chief minister and Keshubhai Patel of the BJP as number two in the cabinet. (It is difficult to visualise that the BJP would have won 69 seats in elections on its own strength.)

The BJP took full advantage of the coalition government. When Advani's rath yatra was flagged off from Somnath temple, it began with provocative speeches by the BJP leaders. Janata Dal in the state was a silent spectator to this provocation. Later, withdrawal of the support by BJP led to the collapse of the then V P Singh government at the centre. It also led to the ouster of the BJP from the state government. After sometime, the Janata Dal faction of Patel merged with the Congress and the BJP became the main party of opposition in the assembly. As a result, the BJP has managed to capitalise on the strong anti-government and anti-Congress sentiments of the people and has tried to give them the colour of Hindutva.

Thus, beginning from its Jan Sangh days, the BJP has become a major party with a strong support base in the state and it expects to form the next state government whenever elections are held. The sooner the elections are held, the easier it will be for the BJP to capitalise on the Hindutva wave and come to power.

Communal Impact on Surat

The communal propaganda at the state and national levels has had its effects on the people of Surat as well. The city had not witnessed any communal riots since 1927 and both local Hindus and Muslims had a history of co-operation in trade and business relations. However, communal propaganda was changing such perceptions, especially among Hindus who have slowly begun to nurture strong biases and prejudices against Muslims.

The propaganda of the BJP has communalised the young in Surat, especially those of Machhi, Kharwa, Rana and Ghanchi communities. They used to be strong supporters of the Congress but have now moved away from it. These communities have prospered in the recent years and are looking for new power equations and broader identities. They are shedding their old customs and 'kuldevis' and have begun adopting the customs of upper castes. The BJP has successfully responded to their aspirations by giving them a broader identity through its Hindutva campaign. Also, its propaganda has given this identity a nationalistic and patriotic colour. The desire for a broader identity and subsequent communalisation in these communities was preceded by a reform movement among them to give up certain rituals. Education is also on the rise among them. Simultaneously, their economic base has widened as they have moved into new areas, instead of confining themselves to their original trade. They are also looking for a wider political role for themselves. While the old political equations and arrangements in the Congress provided them with only limited opportunities, the BJP as a rising force is providing them new opportunities and greater participation. To understand the effect of communalisation in the country, it is necessary to understand the recent history of the Rana, Ghanchi, Kharwa and Machhi community. What follows is a brief examination of the communities.

There are basically four Hindu communities who have prospered in Surat. These are known as 'Ka', 'Kha', 'Ga', 'Gha' in Surat (standing for Kanbi, khatri, Gola or Rana and Ghanchi respectively). Ranas are contemptuously referred to as Golas. They roughly number around a lakh in Surat. They are mainly employed in jari (gold thread) trade. They are concentrated in Golwad and Navapura but the prosperous among them are slowly shifting out of these traditional areas and are ready to pay any price for buying houses in other localities. They have spread to Begumpura, Gopipura, Vadi Faliya, Soni Faliya and other places. They have also begun to buy property in Jhapa Bazaar, which is mainly inhabited by the Bohra community. Initially, the poor Bohras sold their property to Ranas at high prices. However, the Bohra high priest soon realised that if members of his community began to move away from traditional localities, his hold over them might loosen. He, therefore, bought back some of the property sold to Ranas and checked their further intrusion.

The Ranas migrated to Surat from Rajasthan and claim to be rajputs from Rana Pratap's clan. After their defeat at the hands of Muslims, they moved to different places, including Surat. Their original occupation was trading in rice and pulses. Ranas have come up the hard way in the jari trade. They used to be workers under Kanbis. While some of them have become owners, the majority continues to labour under harsh conditions. The working hours stretch from 5 a m to 8-9 p m. One prominent member of the community complained that the workers have acquired bad habits like drinking and gambling. Till recently, education in the community was limited since after a little schooling children would assist in the family trade. But now, education is spreading. The number of graduates has increased and many have become doctors, engineers, lawyers or taken up jobs in government. They have also begun investing in other trades like the powerloom industry.

Golwad area, the old Rana locality, is a crowded, dingy place. Many families have machines inside houses and work there. As new processing machines are installed, the living space for the family gets even more crowded. Women also help in family trade. It is interesting to note how Ranas, serving their Kanbi owners, became owners themselves. Hardworking and honest, Rana workers were slowly promoted to the level of foremen to supervise workers and machines. Some Ranas were employed as account clerks with Kanbis. This helped them to learn about the sources of raw materials and economies of the trade. Kanbi owners began to give the entire work to Ranas on a contract basis while they concentrated on marketing. As Ranas developed contacts with markets, they gradually took over the entire trade and prospered. Today 90 per cent of the jari industry is in the hands of the Rana community.

There have been many attempts to reform the community and pull it out of some old customs, blind faith as well as sectarianism. For this task, Rana Gyan Pracharak mandal

was established by Jaikishan Das Rana, [illegible]bhai Master, Gaudabhai master and others. J D Rana was the first graduate in the community, just before the transfer of power in 1947. Various Rana magazines were published to support and encourage rethinking in the community like *Rana Pukar Patrika* (1942), *Rana Pragati* (1948-52), *Rana Mitra* (1961-67), and *Rana Samaj Patrika* (1969). There was an outcry against alcoholism within the community and the custom of serving liquor during wedding [illegible]monies.

Among Ranas, marriages are an expensive [af]fair. Middle class families even take loans [for] marriages. To curb expenses, the practice of 'samooh lagan' (group marriages) was also initiated. These attempts were made to improve the community, reform its public image of a backward community and use increasing prosperity for social concerns. Today, inter-caste marriages in the community are on the rise, especially with Brahmins, Desais and Patels. Chamunda is their kuldevi (goddess of the clan) but she is gradually being replaced by other Hindu gods like Rama and Ganapati.

These changes in the community were accompanied by its greater participation in politics and with more awareness. In 1952, the first corporator from the community was elected. In 1956-57, two were elected. In 1973-74, Ramanlal Jariwala became the first mayor of the city from the community. Now, there are about 10-11 corporators among Ranas. During 1975-80, Kashiram Rana was the first Rana MLA and between 1984-88, he became mayor or Surat for three terms. He was later elected to the Lok Sabha in 1989 and 1991 on the BJP ticket.

With increase in prosperity, other institutions were also set up by the community like Akhil Bhartiya Rana Samaj (1970), Urban Co-operative Credit Society, Navapura and others. These control marriage halls, dispensaries, etc. Prominent people of the community in these institutions were members of the Congress till a few years ago. However, with the rise of the BJP and its communal propaganda, the entire Rana community has become a strong supporter of the BJP. Pro-Congress individuals are completely sidelined and marginalised. The young are particularly pro-BJP. All the Rana institutions have slipped out of control of the Congress supporters and are now in the hands of the BJP elements. Old Congress leaders are Swaroopchand Jariwala, Nagindas [C]heni and others.

Kashiram Rana, now a BJP member of the [L]ok Sabha and the president of its state unit, has been active in the BJP since its Jan Sangh days. On account of his sustained work, he slowly gained power, both within the community and the BJP. He also took part in the Nav Nirman movement in 1970s and was jailed during that period. He fought against any derogatory reference to the community as 'golas' and claimed its heritage from Rana Pratap. He also fought against double and multiple taxation on the jari trade. In this trade, tax evasion is widespread. 90 per cent of jari trade in Surat, like other trades, is illegal.

Even without being in power, Kashiram is quite influential in the government, including the police. This influence is used to help any member of the community in trouble. He takes personal interest in such matters and provides a protective umbrella. "As a result", laments a Congress leader in the community, "Rana community and Rana businessmen do not depend on Congress help at any stage even though it is the ruling party in the state!" The Congress has entirely given up on this community. In all likelihood, it will concentrate on slums for votes in any future election. Today, all the educated and upright people are within the BJP. As will be discussed later, factional fights and groupism as well as the change in the leadership of the Congress from prominent industrialists/businessmen to lumpen elements have also contributed to the shift of the community to the BJP.

The word Ghanchi has come from Ghani, which was used by this community to extract oil from oilseeds using bullocks (which was their community trade). The Ghanchis mainly stay in Begumpura, Ghanchi Sheri, Tower Road, behind Maskati Hospital and Haripura. There are Modh Ghanchis and Amdavadi Ghanchis. Modheshwar devi is their kuldevi. Amdavadi Ghanchis predominate in Begumpura and Jhapa Bazaar, while in other areas Modh Ghanchis are in majority. They are no longer confined to their traditional trade and have diversified into other areas like textiles, jari, diamond, kirana shops and so on. Today, about 70 to 80 per cent Ghanchis are in textile industry. Ghanchis are entrepreneurial by nature. They would first work under someone, learn the trade and its details, gain confidence and then gradually start their own business. In the recent years, the community has prospered due to the expansion of textile industry since the 60s. Now, they are also in texturising, sizing and dyeing. Earlier, Khatris used to dominate textile trade but now they have been relegated to a secondary position by the Ghanchi community. Almost all are educated at least up to SSC; a large number goes for higher education. Women are also encouraged to study.

Money and prosperity that came to the community after 1955/60, was spent on customs like marriage and death ceremonies as well as to consolidate and expand their business. Roughly after 1956, daughters were married into only those families which owned powerlooms. As a result, the poor in the community found it increasingly difficult to marry, both on account of expenses and the condition to own a power loom. In 1950s, a community group was formed to oppose expensive marriage and death ceremonies. While the refreshment expenses at the death ceremony were curtailed considerably, the same did not happen to marriage ceremonies because marriages are attended by business connections from other communities and a simple ceremony would adversely affect business relations of the community. A magazine, *Jyotirdhar*, was also published to spread modern outlook in the community.

Due to expensive marriages and dowry, which should be at least Rs 50,000 in cash in addition to jewellery, poorer families are forced to marry out of the caste. Hence, inter-caste marriages are increasing. However, even among the rich, these inter-caste marriages by choice are not looked down upon. Women in the community also have a modern outlook. The community celebrates common Hindu festivals and has almost forgotten festivals of yester-years specifically important to the community.

The Ghanchi community has always been anti-Congress. Therefore, they wholeheartedly support the BJP. The BJP has highlighted problems of the textile industry from time to time, especially problems of weavers like tax burden, expensive raw material, and 'exploitation' of weavers by spinners who charge unjustifiably high price for their synthetic yarn (Spinning is a large-scale industry, mostly situated outside Surat except for Baroda Rayon Corporation). The community was quickly influenced by anti-Muslim prejudices. There are four to five corporators from the community, all members of the BJP. Hemant Chapatwala, a BJP member, was the first elected MLA from the Ghanchi community.

Kharwas have been in Surat for many generations. They also inhabit Navsari, Valsad and other places on the banks of Tapi river. In Surat, they live in Rander and Nanpura. Kharwas in Surat have largely come from nearby villages like Ghogha, Mordin, Bhagwa and Dands. During the British period and even afterwards, they mostly worked on ships. However, now employment opportunities in shipping industry have sharply reduced and they are forced to look for jobs elsewhere. Three reasons explain this decline in shipping industry: Importance of Surat as an important port reduced after major port activities shifted to Bombay; air routes have replaced ships as a means of transport for passengers as well as cargo; and the inclusion of SC/ST candidates through reservation quotas on government ships has broken Kharwas' monopoly on such jobs.

The few ships which still use Surat and other nearby ports are oil tankers, meat tankers and other cargo ships. On the ship, Kharwas have worked in lower category of jobs like

'khalasis' and then moved to higher posts like 'tandels' and 'sarangs', who are in charge of the deck crew. Many of them derive their last name from their status on ships. Due to the nature of their work in the past, Kharwas are adventurous and courageous. Also earlier, at least one member of each family used to work on ships. They had to sail for months at a stretch and had none but one another to help in times of need and crises. As a result, strong bonds of comradeship developed among them. Even today there is strong solidarity and unity in the Kharwa community and its youth are very militant.

The members of the community have other vocations as well. There are about 40 to 45 rickshaws, 10 to 12 trucks and four to five boats for fishing. A few of them even work in the powerloom industry. Many Kharwa women work in 'Sardar' wholesale market for vegetables. They have to get up at 4 am everyday to go to work. Kharwa women are known to be very militant. This may be attributed to the nature of their work where unless one is rough and aggressive, there is physical and mental harassment by customers. Some Kharwa women also work as maid servants in upper middle-class houses. Some of the young in the community are alcoholics and run liquor shops. They pick up fights with Muslim anti-social elements who sell liquor in neighbouring shops. Since the Kharwa community is strongly united, even a small fight with members of other communities may soon involve the entire community. There are very few government employees among them.

Traditionally education has not been widely spread. However, the new generation is opting for it and views it as a source of alternative means of livelihood. Education also helps them come in touch with other communities. They have to maintain good relations with others because these contacts may help in future in acquiring jobs, skills and trade. As yet, the Kharwa community has one to two doctors, engineers and lawyers. Gradually, the standard of living has been improving in the community. Their traditional god is Khatribaba and important festival is Divala. However, the younger generation does not follow these traditions.

In general, politically Kharwa community is anti-Congress. In 1977-80, when the Janata Party was in power, one Durlabhbhai Bhagwagar was a Kharwa corporator. In 1985, Jaswant Sarang, a BJP member, was elected a corporator. The elite of the community are divided between the Congress and the opposition, which is presently the BJP. However, this time the BJP wave is not simply anti-Congress but also a pro-Hindu wave. The pro-Hindu wave has provided the community with a wider identity and has consolidated the hold of the BJP over the community. However, reportedly the Congress candidate for the corporation from the community, Anil Bhagwagar, has been able to split the pro-BJP activists and win them over to his side on the ground that the BJP did nothing for the community during its rule in the municipal corporation. It is significant that the split occurred after the riots in the city but for the future one has to watch carefully the equally strong bonds within the Muslim community. Also, liquor dealers in both the communities always pit one community against the other and challenge the lumpens of both. For example, young Kharwas get provoked when some young Muslims burst crackers when Pakistan wins an India-Pak cricket match. Of late, one retired deputy secretary in the home department has been trying to form a broader association of all Kharwas to campaign for education and to persuade them to give up the habit of drinking.

Machhis came to Surat in the 13th or 14th century along with the 'doli' of Nawab from Lucknow. About eight to ten families had accompanied the Nawab to carry his doli on their shoulders. As it would have been difficult for them to go back, they were given land in Rustompura and some were given jobs in Rajwada as soldiers. They are known as Kahars. They began to fish in Rustompura 'khadi' to supplement their income. Since then, they have come to be known as Machhis. After the rule of Nawab, fishing became their main occupation.

Some of their customs can be traced to their ancestors in UP like special big crowns and big garlands used during their marriages. They worship a mosque-like structure in all their rituals (perhaps the Nawabi influence). Their language, even today, is a mixture of Hindi and Gujarati. They have forgotten the original goddess of the clan and have adopted Singotra Mata at Hajira. Perhaps, they began to worship this deity after plague afflicted Surat in which people died like flies. Along with others, they might have gone to Singotra Mata to seek protection for their community.

There are roughly 5,000 Kahars in Sayyedpura, 2,000 in Rudrapura and 20,000 in Navapura. They do not marry their daughters in other communities though they can dine with other fishing communities like Dhimmer. Now, even Singotra Mata is fading to oblivion as the community seeks broader identity. Educationally, it is a backward community. Only 5 per cent are graduates and 75 per cent of the community have taken their schooling up to SSC. They have only three to four advocates, three to four engineers, one doctor and about 10 school teachers. The educated ones are unemployed and most of them trade in liquor. Almost 60 per cent Kahars are alcoholics.

Traditionally, it has been a fishing community. However, after the Ukai Dam was built, the 'khadi' (pond) dried and fishing there had to stop. The community then shifted its occupation to trading in fisheries: they buy fish from Saurashtra and sell it in the Surat market. Ninty per cent of fish suppliers from Saurashtra are Muslims and the rest Hindus. Some from the Kahar community have also become commission agents. There are 18 wholesale dealers in Surat in fish; all are Kahars. They also own cold storage factories to preserve fish. The Kahar women sell fish in the retail market.

Besides fish trade, the community has slowly diverted to other occupations also. They now own more than 100 rickshaws. About 5 per cent have government jobs and 20 per cent work in private firms in powerloom and diamond polishing industries. The turning point for this community came about 20 years ago when five to six enterprising Kahars started quarry mining. After this, they acquired 50 to 60 trucks and began transporting sand as well. The mining and trucks brought prosperity to a section of the community. Only a small proportion of this wealth is invested back in the business and a much larger part is spent on luxuries and liquor. The young are employed in liquor trade and many of them have quickly prospered due to increase in demand for liquor with more affluence.

Like the Kharwas, the Machhi community is also very militant and strongly united. Their strong unity comes from common trade, culture and history. From the very beginning in UP, the community has been very organised and it has retained this unity and militancy in Surat. Muslims and Kahars stay close together. In fact, as one Kahar put it, the Machhi community is surrounded by Muslims. Many times, there are fights between them over liquor trade. There is some competition between liquor dealers of both the communities. Any dispute between these traders often takes a communal turn when they are supported by their respective communities due to strong community bonds and militancy.

In 1991, there was an eruption of communal violence between Kahars and Muslims in Rander and Nanpura. While the riots in Rander were due to elections, the Nanpura riots began with a fight between liquor traders which turned communal. Even at that time, the Kahars attacked a mosque. However, soon peace committees were formed and issue was resolved. It is interesting to note that there were no riots in Nanpura in December 1992. The riots between Kahars and Muslims in Nanpura broke out only during the second phase, only after the BJP leaders were seen talking to Machhis and after maha-artis were organised. The Kahars claim that generally they had good relations with Muslims till two to three years ago and even used to attend each other's marriage ceremonies.

Once again, the recently acquired prosperity and wider trade links make the

community seek a broader identity provided by the Hindutva forces. The community has forgotten its traditional god/goddess and has adopted those of other Hindu communities. In recent years, it has been spending large amounts of money in Ganesh utsav which is lavishly celebrated. The entire community has shifted its support to the BJP in the last four to five years. The young and the liquor vendors are wholeheartedly with the BJP. Bootleggers support the BJP also because of its influence over the police machinery.

The lone corporator from the community, Gulab Borsali was elected on the Congress ticket but he later defected to the BJP when he saw the BJP wave in the community. Kahars vote *en-bloc*. Till about five years ago, the community used to vote for the Congress but now the BJP holds complete sway over them. Some of the young people even attend the RSS parades and are being influenced by its cadre.

To summarise, it may be said that newly prospering communities with diversified trade links and seeking a broader identity have been attracted to the BJP. While Rana and Ghanchi communities provide it with financial resources, Machhi and Kharwa communities supply it with necessary manpower and muscle power. As a consequence, different programmes in Surat in the name of Ram mandir like Ram shila pujan, Advani's rath yatra, Joshi's ekta yatra and sending kar sevaks to Ayodhya have been successful in spreading communal message and anti-Muslim bias.

Today, the BJP in Surat is a party with massive resources and machinery with which to carry out effective propaganda and mobilise thousands of people at a short notice. Thus, kar sevaks to Ayodhya were given enthusiastic send offs. The BJP has so much support in these communities that those who were not willing to participate in its various programmes were branded as born of a Muslim womb. This made even the toughest fall in line and contribute whatever was expected of them. The rally organised by the BJP in Surat on December 6, 1992, when the Babri masjid was destroyed, was attended by a large crowd despite the fact that most of its leaders were away in Ayodhya. Even for the rally on February 25, 1993 in Delhi, which was later banned by the central government, a large group had gone from Surat. The BJP could keep its propaganda machinery fully active after the first phase of riots in the city which ultimately led to the second phase of rioting.

Very large demonstrations were held in Surat to demand elections and oppose firing on advocate Lalwala (described in detail, later). The BJP also tried to gather support among migrant workers and slum-dwellers. It took active interest in their problems. The BJP was in the forefront of demand for a Tapi-Ganga railway line, that is, Surat-Allahabad link, by the north Indian migrants in Surat. It also began to contribute a large amount of funds for religious festivals and utilise these platforms to its political advantage. Kashiram Rana, president of the state unit of the BJP, addressed meetings of 'Uttar Bhartiya Rahwasi Sangh', an organisation of migrants from north India, and took active interest in their problems. Also, two local newspapers in Surat, *Gujarat Samachar* and *New Surat Times*, faithfully reported the BJP propaganda to the public in their columns.

Another factor in favour of the BJP in the city was that it did not encounter any effective opposition from any quarters to its communal propaganda. The secular forces were literally non-existent. The Congress was too discredited to put up a fight and minorities were a divided house. Thus, there was no political challenge to the BJP at all.

Bankruptcy of Congress

The Congress in the state has virtually lost credibility in the eyes of the public. It is seen as a corrupt party which protects bootleggers and underworld gang leaders. Different sections of the people have repeatedly looked for an alternative to the Congress. Whenever there appeared an alternative in sight, people in Gujarat have wholeheartedly supported it. Even today, most of the support to the BJP among people is on account of its anti-Congress stance.

Through its efficient propaganda machinery, the BJP has added to its old charges against the Congress, namely, that it pampers minorities, especially Muslims, for its vote banks and is soft on 'anti-national' elements. As a result, the Congress has indirectly encouraged the growth of these elements. Latif and his gang are cited as an example. They are alleged to have links with Pakistan, assist it in smuggling arms into the country on borders of Gujarat and supply these arms to terrorists in Punjab and Kashmir. The Congress in the state never countered these charges. It also never challenged Hindutva forces on Ram mandir issue.

The Congress is divided into various factions and these are busy fighting with one another rather than confront the accusations against the party. Even in the recent by-elections for the assembly, in which the BJP snatched two seats from the Congress, groupism in the Congress played a significant role. The BJP won the Ellisbridge assembly seat with a huge margin of over one lakh votes. This was made possible because the anti-Chiman Patel faction in the party kept itself out and did not co-operate with the leadership during elections. In fact, there are allegations that the dissidents worked for the defeat of the official Congress candidate.

In Surat, as well, the Congress has lost its credibility among people. It is faction-ridden and to settle their factional disputes, leaders even help the BJP. One Congress leader recalled that previously the party in Surat was led by people who had credibility and commanded respect from the party workers. Now, it is led by commission agents and lumpens who demand money to do the simplest task for the needy.

There are different factions, each loyal to its leader, like Pachchigar faction, Thakore Naik (minister-in-charge of Surat) faction, Jina Darji faction, Sahdev Choudhary faction and so on. Each leader, to be important, must have his own faction in the party. On account of these factions, for a long time the city unit of the party has not had a president. It only has an acting president, Naginbhai Bardolia. Muslims in the Congress are also badly divided. One faction is led by Kadir Peerzada, leader of the party in the municipal corporation. Mohammed Surti leads another faction, and there are others.

Earlier, the Congress was in power in the municipality with the help of a few independents. However the party lost it due to fights among different factions as well as the ambition of its leader, Ajit Desai, to become mayor of the city.

He defected to the BJP and fulfilled his ambition with its support. When some other corporators began to feel insecure about their position and got an assurance from the BJP that they would be given tickets in the next election, they also defected to it.

Kadir Peerzada has a reputation of being a smart tactician. He effectively opposed the BJP in the corporation due to his experience and knowledge. Therefore, the BJP is totally against him. Its entire machinery was used to push him out of the leadership of the Congress in the corporation. This would have not only prevented the emergence of a Muslim leader but also of someone who could provide an effective opposition to the BJP. An attack on the Congress always had Peerzada as the target. Thus, he was blamed for riots during assembly elections in 1991 as well as the recent riots in the city. The BJP alleged that he planned the bandh call in the city on December 7, 1992, with Mehmood Pardewala and was also responsible for the violence that ensued. As a result of such determined propaganda by the BJP against Peerzada, even non-communal Hindus in Surat are convinced today that he had a hand in 1991 as well as the recent riots in Surat for his narrow political gains.

Peerzada was once again made a target in the case of firing on advocate Lalwala, the BJP candidate for Shahpur-Nanawat seat. In the belatedly filed FIR, his brother's name was deliberately included. Then, the BJP repeatedly demanded the arrest of all those named in the FIR. Their objective was to get Peerzada replaced by a pro-Hindutva leader in the Congress. Hindus in the Congress are no longer willing to be led by him. He used

to regularly issue statements to the press. The BJP countered them. Now, Peerzada has stopped this practice and nobody else is doing this work.

Mohammed Surti is another old Congress leader.[9] He was responsible for inducting Muslims in the party and groom them for leadership. However, in the recent riots in the city, he kept quiet. A faction of Muslims in the Congress is opposed to Kadir's leadership, who became a leader at a very young age. He was the party candidate for assembly elections in 1991 from Rander. The old Muslims in the party were sidelined. They resented this and some even worked for Kadir's defeat. He lost the election because a section of Muslims voted against him.

To sum up, the entire machinery of the Congress has been immobilised. It has not been able to counter the BJP in any way. This has given the BJP a free hand in the city to propagate its communal politics.

Divided Muslims

If acts of commission and omission by the Congress helped the BJP gain strength, Muslims, divided into too many groups, along community as well as political lines, utterly failed to protect their democratic rights. In Surat, there are about 1.5 lakh Muslims. Generally, they vote for the Congress. However, Bhartiya Minorities Suraksha Mahasangh also has some influence in a few slum areas. BMSM is insignificant in terms of votes it gathers, but it has a nuisance value due to its lumpen leadership. Mehmood Pardewala, who runs a theatre, is president of this outfit. He is also alleged to be the right hand man of Latif in Surat and distributes his liquor in the city. As a result, he has influence over the lumpen elements of the community in some slums. Pardewala donates money to slum-dwellers in times of need. After floods in Surat, he is said to have donated money for relief work. He also has some dalits under his banner and is often seen in company with other dalit leaders.

The rest of Muslims are in the Congress and are divided into different factions. There are Memons (three to four subgroups among them), Khojas and Bohras. These are relatively affluent communities and have prospered in Surat. Some families have been staying in Surat for generations. Burmese Bohra and Sunni Bohra groups are settled abroad and have made a lot of money there. Then, there are poor Muslims in slums from Khandesh, north and even south. Some are from villages around Surat. These Muslims are either hawkers or employed in bakeries. Very few work in industrial jobs. Business communities of Bohras, Khojas and Memons have their own trusts which collect large amounts of money. This money is utilised for building mosques and madrasas for religious instructions. The money is not used for modern education or hospitals. There is only one Muslim hospital in Surat, Lokhart and two to three schools. Tabligh Jamat spreads conservative values in the community. These trusts sponsor and support community leaders with political aspirations. These leaders in turn pander to narrow aspirations of the community instead of providing it with a broader perspective.

Most of the relief work after the riots in Surat was primarily carried out along community lines though members of other communities were also given help. One Khoja Muslim leader said that, when he went to the hospital, he was relieved to see that there was no Khoja among the dead which meant they were not killed in riots. Before, and even after the riots, there was no leader among Muslims in the city who would think and work for the entire Muslim community irrespective of factions and party politics, that is, defend the rights of minorities and articulate their point of view. There is no single leader to guide the community, give it a programme and provide future direction. Despite riots, Muslims in Surat remain a divided lot on community basis and along political lines.

III
Condition of Migrant Workers in Surat

The riots in Surat and large-scale killings, looting, arson and rapes were almost exclusively confined to the outskirts of the city, largely inhabited by migrant workers living in slums of Udhna, Pandesara, Varachha Road, Katargaam and other areas. Thousands of migrant workers actively participated in the riots. In fact, the BJP had very little hold on the migrant workers, who have been ignored by all political parties though they constitute more than 50 per cent of the population of Surat. Their participation in the riots does not seem to reflect any outburst of Hindu sentiments or reaction to the bandh and subsequent violence by Muslims as the BJP would like people to believe. The migrant workers are hardly aware of political events in the country or in the city. Hard work, long hours at work, exhaustion, low wages and language barriers in the alien city ensure that the migrant workers remain ignorant.

The Oriya 'malis' are the least prejudiced against Muslims. They have no Muslim population in their native villages and the BJP is not strong in Orissa. Yet, they actively participated in the riots and viciously attacked Muslims: the mosque in Pandesara was destroyed only because of their lead as the resistance by Muslims from inside the mosque was strong and north Indian and other migrant workers were unwilling to approach the mosque. The workers from Andhra Pradesh are more communal in their attitudes towards Muslims, at least partly on account of the Nizam rule there in the past. Yet, their involvement in riots was almost nil.

Migrant workers participated in the riots because of their feeling of insecurity in an alien city which brutally exploits them, suppresses their culture and has nothing but contempt for them. It was also an outburst of their anger and frustration at their inhuman living and working conditions. It is, therefore, necessary to analyse their socio-economic background to understand their role in riots.

One aspect of lives of migrant worker stands out. All of them live in groups and clusters from their own regions. Mixed localities do not exist. They maintain strong links with this native place and long to go back. They are alien to the city as the city is to them. They are identified by their regional groups: Oriya mali, Madrasi (people from Andhra Pradesh), Bhaiya (north Indians), Kathiawadi 'gamadiyo' and so on. They have a strong sense of their regional identity which they zealously preserve by their strong regional solidarity and intra-communal bonds. They, in fact, recreate their own state in the city and in localities where they live. It appears as if portion of those states/regions have come to reside in the city.

The fast growing city of Surat has attracted people from different parts of the country. Before independence, Halpatees or Dublas, tribals in Surat district, migrated to the city. As other industries got established in the city after independence, labour, especially from backward regions where there are no sources of employment except lowly-paid seasonal and scarce farm work, began to migrate to Surat to earn some livelihood. Some even made fortune with small investment and hard work. However, while workers sweat it out for 12 to 14 hours a day in unorganised sector, wages are meagre but not as bad as they are back home. For example, in Orissa, farm labourers earn Rs 7 to Rs 14 per day depending on the season whereas in powerloom industry in Surat, wages are up to Rs 70 a day! It is then hardly surprising that migrant workers and their families constitute more than 50 per cent of population of Surat.

Working Conditions

Small-scale units dominate industrial activity in Surat. There are only a few large-scale or medium scale units. Workers, employed in these small units, find it very difficult to organise themselves and struggle for better working conditions. Labour laws are ignored with impunity by owners of units and workers have little legal protection and security for their jobs. In fact, precisely on account of this factor, small units have been

encouraged by big industrial houses who benefit from shift in investment and production away from big cities where workers have unionised and have managed to gain higher wages and better working conditions.

Main employers of migrant labour are industries like art silk and powerlooms, dyeing mills and diamond industry. Except for in some dyeing units, workers have to work 12-14 hours a day. For example, in powerloom units, workers have two shifts of 12 hours each. Working conditions are abysmal. Again in powerloom sector, work is carried out amidst deafening sound of machines and the air filled with cotton dust, responsible for more than average cases of tuberculosis and deafness. These units are concentrated in a few industrial estates/ societies. These are spread throughout the city. Each unit may have two to 48 machines in most cases; a few units have more than 48 machines. Generally, each worker in weaving section operates four machines. Inside a unit, the floor space between machines is just about enough to arrange machines in rows. The operator can barely squeeze himself between the machines to operate them. The worker is on his feet for 12 hours in congested surroundings with no room for any physical movement or rest Often, these small 'galas', as these units are called, do not even have clean water to drink or for toilets.

The industry employs women workers in spinning and wharping work. Women workers are paid much less than men workers. Complaints of sexual exploitation of women are not uncommon. These women workers are mostly Gujaratis or Khandeshis. Child labour is also employed in different departments of art silk industry, especially in passing beam threads through the comb on the weaving machine. Workers are often beaten up by the employer for minor mistakes or damages in production. Satyanarayan, a migrant worker from Andhra Pradesh, once went to a gala for work, the owner asked him to join immediately. When he inquired about the piece rates in the gala, the owner gave him a thrashing for daring to ask the rates!

Workers can be thrown out at will without being paid any compensation. No legal procedures are followed for terminating services of any worker. They have no proof of their employment in any unit and, therefore, they cannot seek any help from the labour grievance redressal machinery of the government. In a large number of cases, the worker does not even know the name of the gala/factory and of owner(s).

Whenever workers attempt to organise themselves and collectively protest against unfair practices in a unit or seek collective redressal, goondas or the police are promptly summoned by the owner to warn the workers and, of course, the police promptly oblige. Even a single day's absence by a worker, due to sickness or any other emergency, can lead to abrupt termination of his/her services. Severe working conditions require only young workers. Almost all the workers in the industry are less than 45 years old. After that age, they can labour no more and return to their native places.

Formerly, only Gujaratis used to invest in the industry, but now other communities like Kathiawadis, Telugu and others from Rajasthan and Punjab have also joined the expanding powerloom industry. Most workers come from Orissa, Andhra Pradesh, Uttar Pradesh, Bihar and Khandesh.

With workers employed in small galas, divided and insecure, it is difficult for them to organise themselves and fight a long drawn out battle with employers. However, there are about 20 unions of workers though the total strength of all unions, taken together, is not likely to be more than two to three thousand workers.

Sometimes, workers spontaneously close down units and negotiate their piece rates. Some of the migrant workers from Andhra Pradesh are politically conscious due to strong CPI(ML) movement in their native place. These workers have formed three unions in Surat: Gujarat Shramik Sangathan, Mazdoor Vikas Manch and Naujawan Bharat Sabha. But despite conscious efforts, none of these unions has been able to overcome its regional barrier and bring workers from other areas within its fold along class lines.

Whenever a Telugu worker, familiar with these unions, loses his job, he approaches the union. After threat of violence by the owner or the union, the worker may be awarded some compensation. But only rarely is the union able to force the employer to take back the worker. If any north Indian worker is thrown out of his job, he is most likely to approach the HMKP for some legal action. Its leader is Dasrath Nagar, himself a north Indian. Thus, unions are, perhaps unwittingly, divided along regional lines. The city has not managed to break these regional bonds

Telugu workers are almost exclusively in weaving section as weavers. Oriya workers have also recently begun to work in weaving section but most of them are still in winding section. Khandeshis are mostly in spinning and twisting sections and north Indians are also mainly in weaving section Very few Muslims are employed in the powerloom industry as workers.

The basic reason for this regional division of work seems to be that once a worker gets a job in an industry, he slowly invites people from his region for jobs. When they come, the employed worker trains them in skills known to him. Then they usually manage to find jobs in the same section in the industry, sometimes even in the same gala. (The training is done clandestinely at night when the owner is not around at the gala.) Thus, over a period of time, various sections of the industry get divided along regional lines.

Only two factors tend to break the regional pattern of employment: (i) significant differences in wages between different sections; and (ii) crisis in one section leading to large-scale retrenchment and forcing workers to seek employment in other sections. In the absence of these factors, employment in sections continues along regional lines. Some Oriyas took up jobs in weaving section partly due to slightly higher wages there and partly due to large-scale migration of workers from Orissa.

There are about 250 dyeing mills in Surat employing about 30,000 workers. Muslims own 12 of these mills. Muslims are Suratis, Dhorajees and Memons. Generally, people from Rajasthan and Punjab dominate this trade. The dyeing mills employ mostly north Indian and Khandeshi workers. Of late, some Oriya workers have also been employed in this industry. In large- and medium-scale dyeing units, some unions are active like the HMKP. But unions are weak due to employment of contract workers in the industry. As a result, there is no significant difference between average wages for different workers. However, wages here are slightly higher than those in art silk industry.

Diamond industry is yet another important industry in Surat. According to the southern Gujarat Chamber of Commerce, the total daily production in diamond industry is to the tune of Rs 6 crore (next to art silk industry where total production is about Rs 20 crore daily). It employs about four lakh workers. However the industry is widely scattered and units are located even in small tenements. This makes it difficult to estimate total number of units in the industry. 80 per cent units are housed in 20 by 15 rooms with up to five machines, known as Ghantis. Each unit employs 20 to 30 workers. Though the industry has links with Bombay, the distribution of diamonds is done from Palanpur and is controlled by Jains. The diamonds from Bombay are sent here for polishing. There are several operations to be carried out, like cutting, brushing, polishing, etc, before the diamond is ready for the market. Kathiawadis dominate this trade. Workers are also mostly Kathiawadis.

Migration of workers to this industry began in the early 1970s. Later, due to three consecutive droughts during 1985-88 in Saurashtra, people migrated in large numbers and they came to be mostly employed in this industry. There was some migration from Palanpur, Disa in Banaskatha district and Mehsana. Till 1985, the industry expanded rapidly and profits were high. Big earners became land agents. They also invested their profits in powerlooms, chemical units, farming and cash crops like bananas and

sugar-cane. In the diamond Industry, only 15 to 20 groups have latest technology and employ workers in large numbers. Almost 60 per cent of total polishing work in the country is done in Surat with annual turnover of about Rs 3,000 crore. Recently, the industry suffered crisis with reduction in the volume of diamonds processed. This led to lower wages and production. Here, the rise in wages is far behind the inflation rate and workers are heavily in debts.

In diamond industry, it is a normal practice to give loan to workers for marriage and other occasions. It is gradually recovered by the owner from wages to be paid to the workers. However, there have been cases of workers being beaten up or tied to the machine when they were unable to earn enough to pay back the loan. A worker is forced to remain with the owner till the loan is repaid. The normal working day is long: 12 to 16 hours. Average monthly earnings range from Rs 1,500 to Rs 2,000. Often, workers are accused to stealing diamonds. 'Blind faith' is used to detect the thief; the suspected worker is tied, beaten up and tortured. Recently, in a press release, workers alleged that in some units the owner kept special room to torture workers; the worker is tied to iron rings attached to the ceiling of the room and beaten up. Feudal norms prevail in the industry and also govern employer-employee relationship. Workers usually wear lungis and baniyans for polishing work. Whenever the owner is to visit the unit, the manager is intimated in advance and workers are asked to change to 'proper' clothes even though they do not feel comfortable in these.

Living Conditions of Migrant Workers

Migrant workers live in miserable conditions, generally at outskirts of the city. Most of them live in rented kachcha houses with barely enough space to sleep. Diamond workers often sleep inside the factory itself. These kachcha houses are dark inside and have poor ventilation. Though migrant workers constitute more than half the population of Surat city, their slums are hardly provided with minimum municipal amenities like water, electricity, roads, health clinics, etc. Only some migrant workers stay in tenements constructed by the government. In most cases, workers only keep their belongings in houses and live and sleep outside. For example, on Varachha Road, where Kathiawadis stay, every evening a large number of people can be seen on the roads outside houses, sitting and chatting. Most workers leave their families behind in their native place and only rent sleeping place in small dwellings. For instance in a 10 ft by 15 ft room, more than 30 workers rent sleeping place and sleep in shifts. About 80 per cent of Oriya workers, 60 per cent of Kathiawadi workers, 40-50 per cent of Telugu and north Indian workers live in the city without their families. After working for 12 hours, workers without families have to perform a number of household chores. Since there are hardly any public toilets in slums, most people, men and women, use open space and railway tracks for the purpose. Thus, the same oppressive conditions prevail in the slums as at the work-place. Usually, big slums are inhabited by a mixed population from all communities and regions though the population of each region lives in an exclusive cluster.

Workers feel all the more miserable because they are in an alien city with an alien culture. The alien city not only exploits them but also suppresses their culture. They feel they have no one in the city to speak for them and their problems. In the absence of a strong midddle-class/intellectuals among them, they do not find any one to support them and give a voice to their cultural and social aspirations. Thus, migrant workers feel a loss of their identity.

Till recently, the Congress could mobilise votes of these workers through different mechanisms without solving any of their problems or even representing them. For example, slums of migrant workers receive few amenities from the city municipal corporation. Yadgiri, a Telugu worker from Limbayat area, said that the Telugu people voted according to the wishes of 'peddamanshi', a senior citizen among them. Each small by-lane and small cluster of huts has a peddamanshi. He normally asks people to vote for the Congress in the absence of any strong alternative. Most of them are not supportive of the Congress. Some are even critical of the Congress. However, as the Congress wields power, peddamanshis have to approach its leaders for odd works. They are also supplied liquor during elections by the Congress to ensure their support for the party. However, when the winds of change blow and any strong alternative to the Congress emerges, these peddamanshis ask the people to vote for the alternative to try it out. In the last municipal elections, for example, when a CPI candidate (also from Andhra Pradesh) emerged as a strong candidate, people switched their support to him. Similarly, during 1989 Lok Sabha and assembly elections, migrant workers also joined others to vote for change with hopes for a better future.

In order to overcome their feelings of alienation in the city, migrant workers forge strong bonds with others from their own region. In the absence of a strong trade union movement and other platforms, these bonds lead to solidarity within a community and re-create their regional socio-cultural milieu.

Migrant workers from Maharashtra came to Surat earlier than workers from other regions. With a population of about four lakhs, they constitute the largest group among migrant workers. They come from Nandurbar, Dhulia, Jalgaon, Nasik, Aurangabad and other places. Out of these, Khandeshis from Khandesh, on the borders of Surat district, from the biggest group. Borders of Khandesh (Navapur taluka) are about two-three hours away by bus and it is well-connected to Surat. The meagre landholdings of small peasants, landlessness, backwardness and lack of adequate employment, droughts and non-implementation of Employment Guarantee Scheme of Maharashtra state government in the region are major reasons for migration of Khandeshis to Surat. Due to similarities between Marathi and Gujarati languages, Maharashtrians learn Gujarati faster than workers from other regions and are better integrated with the life in the city. Among migrants from Maharashtra, there are shimpis, chamars, patils, sonis, Muslims and dalits. Dalits are organised by the Republican Party and Dalit Mukti Sena and are more assertive. Different dalit issues are taken up by these parties and often rallies are taken out to highlight the issues.

Till recently, others have been with the Congress or Janata Dal. They work in powerloom, tailoring, and dyeing industries. Very few are employed in diamond and construction industries. Some work in government departments. The Muslims are petty traders, rickshaw-pullers and some are involved in bootlegging. In the present Surat Municipal corporation, there are five to six Maharashtrian corporators, elected on Congress/Janata Dal tickets. One Khandeshi corporator is a Muslim.

Says one Bhimrao Kashinath Patil: "In times of difficulties or emergency like marriages, sickness, people from my native village come forward to help. After my duty hours, I normally come home, but sometimes I visit people from my village. During festivals, I visit my relatives and friends who are from my native village."

The Maharashtrians have collected money and constructed their own temples. They usually visit these temples to pray during festivals. They have a 'panch', as is their traditional custom, who resolves their dispute. They also have a marriage hall. About 50 per cent marriages among them are solemnised in Surat itself, unlike migrant workers from other regions who mostly go back to their native place to get married. Shiv Sena is now trying to have a political base among the Maharashtrian migrant workers. It has formed Jai Bhawani Yuvak Mandal and Chhatrapati Shivaji Mandal to extend its influence among Maharashtrians in Surat. One Suresh Sonar is the president of Surat shakha of Shiv Sena. The Sena has utilised the recent riots to gather support among Maharashtrians in particular and Hindus in general. It has also found a strong base among Maharashtrians in Pandesara. It regularly holds meetings there to propagate

its communal politics and actively participates in celebrating festivals like Ganesh Utsav, Shiv Jayanti, etc.

In Surat, there are about 1.5 lakh migrant workers from UP. They have come from Faizabad (lower castes, harijans and adivasis), Varanasi (yadavs), Gorakhpur (brahmins), Banda (brahmins, adivasis, harijans. They have the reputation of being militant and are not very literate), Allahabad (patels—forward caste) and some are from Bihar. About 50 per cent workers are without families, especially those from Banda. They work mostly in powerlooms and dyeing mills. The largest group of north Indian workers lives in Pandesara. Others live in Katargam GIDC, Udhna and other areas. Pandesara is at the outskirts and is not well connected to the city. Most workers work near Pandesara GIDC and Sachin (even farther away from the city). In Pandesara, they have bought residential plots in a nearby village Bamroli and live there. Their colony has come up over the years, yet it has no water or electricity connection and no pucca road. During monsoon, the entire area becomes slushy and it becomes difficult even to walk. The north Indian workers positively hate their living and working conditions. However, they are forced to leave their villages due to meagre income as a result of unproductive land and dry farming there. The money earned in Surat is useful for repaying debts incurred back home and/or for agricultural activities. To earn adequate dowry for their daughters' marriage is another reason for migration. About half of them live here without their families because wages are low and the problem of housing is acute. Also, there are very poor facilities for education of children. If the family has a small plot of land in the native place, it stays behind to cultivate it. About 40 per cent migrant workers from north India are landless labourers. 40 per cent come from small peasant background and only about 5 per cent own substantial land. These workers have no panchayat or caste organisation in Surat. They do not adhere to caste norms, freely mix and dine at each other's place. This is partly because far away from home, they need one another irrespective of their caste. Women in their families do not go to work, though some of them work at home to earn some money. They also follow ghunghat system when elders from the village visit them but not in their daily life. These workers celebrate festivals of Diwali, Dassera, Holi, Ramnavmi and so on. Every year, Ramlila is performed on a large ground near Athwa Lines.

A few years ago, north Indians in the city were mobilised on a large-scale to demand Ganga-Tapti railway line. About 70,000 people had gathered in a rally to demonstrate their support for the demand. The BJP had supported the issue and had even led the march. It was led by Dudhnath, Ayodhya Mishra, Ram Barang Yadav and others. These workers are also occasionally militant in their struggle with owners ('sethias'). One Hanuman Singh emerged as a leader from among these workers He was active in Surat Silk Labour Union. Later, owners got him killed, fearing his militancy and his support among a large section of north Indian workers. For workers' problems, he was always ready to lead a tough fight. The union was not strong enough when he was killed. As a result, its growth was checked. He is still remembered by workers though he died about 15 years ago. After his death, north Indian workers became leaderless and desolate.

As Ram is a very popular mythological figure in north India, the BJP was slowly able to attract a section of north Indian workers in the name of religion and Ram Janmabhoomi. A few workers also went for kar seva in Ayodhya. But, their general atitude is: we have come here to earn. Why lose wages for the sake of Ayodhya? However, north Indian workers of Pandesara participated in riots on December 8, 1992. They were agitated by rumours and the announcement by the mahant of Bamroli mandir (also from UP) that the Muslims were coming in large numbers to attack the temple and Hindus should gather around it to protect it. The mob gathered in thousands due to insecurity, curfew and general tension. It was then incited to attack selected targets, and riots and looting began. One north Indian worker who had joined in riot recounted how insecurity among them led them to attack these targets. The police also encouraged the mob to loot. The workers without families were in the forefront of rioting while those with families were more worried about the safety of their families.

After riots, the police started to arrest people arbitrarily and arrested whosoever it could lay its hands on. Fearing arrest, the mahant of Bamroli temple later ran away. He was afraid that the people would beat him up if they saw him. Many of these workers now repent that they believed rumours and attacked Muslims. They also regret the loss of wages for two or three months due to riots. In Pandesara GIDC, Muslims are also employed but they have never had any trouble before and even after riots, when Muslim workers returned to work, there was no communal feeling against them.

There are about two lakh workers from Andhra Pradesh in Surat. They have been coming to Surat for work for the last 20 years. Most of these workers are from Telangana region, a backward part of AP spread over eight districts. The area has also been a traditional base of communists. However, there are people from coastal region as well as other parts of AP. About 50 per cent of migrant workers from AP belong to a traditional weaving caste called 'padmashali'. In fact, till 1983, only Padmashali migrated. After that, people belonging to other castes like brahmin, reddy, vaishya, chadali (dhobi) and mangali (barbers) also began to come here to look for jobs. In Surat, due to the important role that money plays, caste barriers have narrowed over period. However, while workers eat at one another's place irrespective of caste, they still marry only within their caste.

After a crisis erupted in the handloom industry in AP (deaths of Chirala handloom workers due to hunger received a lot of publicity), many workers started looking for better prospects. Some migrated to Bombay, some to Bhiwandi and others came here. Roughly, 50 per cent of Telugu workers in Surat live with their families while others have left their families behind due to lack of proper housing and low wages. Almost the entire Telugu community is employed in powerloom industry, most as workers while some have set up their own units after selling land in their native place and investing it in powerlooms. Some own small shops providing various services/goods. A few are employed as teachers in primary schools of Telugu language.

For people from AP, language has proved to be a big barrier in their interaction with non-Telugu people. Very few of them can converse in or understand Hindi or Gujarati. As the Teulgu community in Surat is relatively large, they have no compulsion to deal with people from other communities. They live in clusters with their own people. As a result, they almost constitute a mini-Andhra in Surat but they miss their folk culture here. The result is that when cultural troupes from AP come to Surat to perform, they receive enthusiastic response. The Telugu workers also confine their talk and discussion to politics and other issues in AP. They are hardly aware of Surat outside their workplace and slums. Only a small minority of Telugu shopkeepers and powerloom owners has to interact with other people and they speak Hindi and/or Gujarati.

The caste associations, caste panchayat and their traditional god Markandeshwar have strong presence in Surat as well. Any dispute between two Telugu persons is rarely reported to a police station. Instead, these are resolved within their own traditional panch system. Panches demand a huge deposit and other expenses are incurred, but Satyanarayana, a Telugu worker and the president of Gujarat Shramik Sangh says: "Here in Surat, traditions are strictly adhered to and even in worse forms than in the native village". A community experiencing alienation is very likely to rigidly observe traditions to seek security. Also, money plays an important role. Recently, an incident took place which illustrates this. One day a crowd of 150-200 people, gathered in a small lane, began to shout angrily. It pointed to a hut and

accused the woman living there of practicing witchcraft that had made a girl very ill and ensured that no medicine helped her condition. They claimed that this woman had already killed four children of that lane through her witchcraft. The crowd was worried about the safety of their own children from her. The accused woman was frightened that if she was caught the crowd would beat her up and she had managed to escape after a little beating. Immediately, people said that the panch must be called to resolve the issue about the link between the woman's witchcraft and death of four children. One worker said that in their own village, nobody believes in witchcraft and it was terrible that his community in Surat should follow such practices.

Similarly, after L K Advani's rath yatra, peddamanshis had sympathised with the cause of Ram temple. They wondered why Hindus could not build a temple in their own country. After the riots, they have come closer to the BJP because they believe it to be the only party that can save them. In the basti, in day-to-day issues Muslims dominate Telugu people. This had led to some anti-Muslim feeling among them. The BJP has been trying to gather more support among Telugu workers by financing their Ram Navami festival. However Muslims from AP live peacefully with them.

The migrants from Orissa, Oriya malis, are more closely-knit, display more solidarity among themselves and are more militant than others. They mainly come from Ganjam, a backward district in a hilly part of Orissa. Some also hail from Puri and other districts. There are more than three lakh Oriya workers here, employed in powerloom industry. In Surat, they are called Oriya mali. Jagannath Patti of the department of sociology, south Gujarat University, Surat suggests that initially migrants from Orissa were mainly employed as gardeners and watchmen. This earned them the name Oriya mali. Some of them got jobs in expanding powerloom sector. Due to better wages, gradually they all shifted to powerloom industry.

An Oriya worker, Rama, migrated to Surat some 15 years ago. At that time, he was working in a coal mine in Ranchi, Bihar, when he received a letter from his uncle in Surat. His uncle asked him to leave Ranchi and come to Surat because jobs were easily available and wages were good. Today, Rama owns a house in Pratapnagar, near Bombay Market, in Surat. In his dark hut, made of tin and gunny bags, he stays with about 18 other Oriya workers, though at a time only up to 10 workers can sleep inside the hut. A larger number can be accommodated because workers work in shifts. They cook collectively and Rama charges them for food and accommodation. He himself works in a powerloom unit. Most Oriya workers live in huts like Rama's as tenants. Very few own a hut. Most of them have left their families behind in native place.

There are about 300 people in Surat from just one village, Pankaj's village, in Orissa! This village is located in a hilly area and land there is not very productive. Besides agriculture, there is no other avenue for jobs. Land in the village is concentrated in a few families, mostly brahmins. Brahmins by custom do not touch the plough even today. The dry-land farming practised in the village can sustain very few people. In their native district, there are hardly any Muslims, less than 5 per cent and it has no history of communal riots. Women do not step out of their homes and are not allowed to work outside except in a few agricultural operations on their own land. Oriyas of forward as well as backward castes have migrated to Surat. Caste panchayats are very strong and feudal norms and values dominate the village life. Literacy and the level of formal education is one of the lowest among migrants from Orissa. Except a few, nobody can read Hindi or Gujarati. Some of them can read Oriya, their native language, but there is no Oriya newspaper/ magazine available in Surat.

The oppressive working conditions, long hours at work, household tasks, low level of literacy and the language barrier, not only segregate Oriya workers from others in Surat but also keep them ignorant of any event in the world outside. The only link with the outside world, apart from powerloom units where they work, is through occasional letters from the village or news brought by those returning from the native place. These factors combine to create strong bonds of solidarity among them, impart militancy to the group and enforce a strong urge to preserve their own world-view for security and solace in an alien and oppressive environment.

Oriya workers are shy before strangers and staunchly defend their traditions and customs when questioned about them. A few incidents in Surat illustrate this. Oriya workers do not join any trade union or play an active part in it. However, when in a unit, one Oriya worker was thrown out of his job, all Oriya workers forcibly closed down the unit and began patrolling the area with lathis in their hands, ready to strike anyone who dared to work in their place. The owner called the police but they remained undeterred. The militancy of Oriya workers forced the owner to take back the worker whose services had been terminated—a rare event in Surat.

A large number of Oriya workers go to Orissa for Lord Jagannath's rath yatra. They collect money for it. During that period, they strongly fight with owners of units for maximum termination benefits. Nobody picks up any fight with an Oriya worker because they know that in such cases, a big group would soon emerge to retaliate. Pankaj, an Oriya worker in powerloom industry, said that they are not in the habit of going to a police station with a complaint. If there are any quarrels within the community, they settle it among themselves with their panch system. Justice is administered by imposing appropriate punishment or fines on the guilty. If one of the parties involved in the dispute is non-Oriya, they still do not go to the police. The aggrieved Oriya worker reports the matter to his friends and others in the community. Traditionally, they are offered liquor and all go out in a group to settle the issue. They have their own ideas of 'wrong' and 'right'. In cases where there is a complaint against an Oriya person and the police are likely to arrest him, he runs away to another basti and sometimes to his native place to escape arrest. Pankaj says: "We are very scared of the police. They beat us mercilessly, without any reason on the slightest pretext. There is no one to help us against the police brutality and lawyers only assist the police despite charging high fees from us." Thus, the fear of the police is very real for them. Also, they have no political support whatsoever because unlike migrants from other regions and states, Oriyas work almost exclusively in the powerloom industry. There is hardly any middle class section among them like shopkeepers or the unit owners who can intervene effectively on their behalf or/and get their work done.

Very few Oriya workers bring their families along and even fewer send their children to school in Surat. There are hardly any Oriya schools. Hence even Oriya teachers are very few. The display of militancy by them is the only way to protect themselves. They do not take any initiative in demanding municipal amenities but support others as and when such problems are taken up. For ration cards and similar things they approach the local leaders and corporators. In this, some workers who have been living in Surat for years help them. Oriya workers show little interest in voting in elections except in those slums where they are concentrated. Of late, the BJP has been trying to woo them for support. These workers have always voted for the Congress till now. The Oriyas are among the least communal groups and have no anti-Muslim prejudices. Kalu Patra and Tripathi, two Oriya workers, are active in the BJP but they have no support at all in the community in Surat.

In mid-80s, Utkal Samaj Samiti was formed. Its president Ashok Patra was a member of the Congress. This organisation is now defunct and money collected by it in instalments for residential plots remains unaccounted. It was inaugurated by J B Patnaik, the then chief minister of Orissa.

The Kathiawadis migrated to Surat from Saurashtra region, especially Junagarh, Amreli, Bhavnagar and other places, sometime in early 70s. Saurashtra is a backward region of Gujarat Its inhabitants are mainly dependent on agriculture, which is not much developed because of its dependence on monsoon. In the coastal belt of Gujarat, due to increase in salinity, the productivity of agriculture is declining. Land is concentrated in the hands of a few rich families who grow cash crops like groundnuts.

Most migrants from Saurashtra belong to Patel caste. The caste system and orthodox religious practices are rigidly followed in Saurashtra. Backward castes and scheduled castes are routinely oppressed by forward castes. For instance, Vankars are beaten up and terrorised on the slightest sign of their assertion and affluence like wearing better clothes, not bowing in the presence of the upper caste people and so on. Disputes over wages are common.

People of Saurashtra are deeply religious in nature. There have been a number of religious movements in Saurashtra. For example, Jalaram Bapa, Morari Bapu and other saints are revered here. Thousands of people attend their preachings and sermons. One Kathiawadi jokingly suggested that any one can attract people in Saurashtra if one wears saffron clothes and goes to a village. Many religious gatherings are held in Saurashtra, like Sitra and Satam. In the past few years, religious movements have deepened the faith of the people. The saints have also been propagating on the Ram Janmabhoomi isssue. As a result, the BJP has been able to make inroads in Saurashtra and consolidated its position. Since the Jan Sangh days, it has a foothold in Saurashtra. BJP gave a political colour to this religiosity of the people by extensively carrying campaigns on Ram mandir issue and spreading prejudices and lies against the Muslims. The Kathiawadis of Saurashtra were carried away by the propaganda. With the Kathiawadis of Saurashtra coming under the sway of the BJP, those of Surat also got communalised due to their close contact with their native place.

In 1989 assembly elections, three out of the total four assembly seats in Surat were won by the BJP. From the Varachha Road area, which is dominated by Kathiawadis, Manubhai Pithawadiwala won. Manubhai is reputed to have links with illegal activities, land-grabbing as well as diamond factory-owners. He also campaigned for change and called upon the youth to channelise their energy towards change, take the initiative and fight unemployment. He presented himself as an agent for change. He appealed for the unity among people from Saurashtra and declared himself to be an advocate of their interests He adopted a militant posture in favour of Kathiawadis and won his seat.

As pointed out earlier, Saurashtra is an underdeveloped region dependent on agriculture. Kathiawadis are staunch supporters of tradition. They vehemently preserve traditional values and are proud of them. Muslims from Saurashtra are also proud of its culture. Here, joint family system is still prevalent. Underdevelopment, resultant poverty and uncertainty associated with change reinforce traditional values and culture in the region. Their popular image is that of simple villagers, warm and hospitable. Guests are always welcome in their houses. They go out of their way to help a needy and a poor person. At the same time, Kathiawadis are known as militant fighters if provoked. For example, they reacted angrily on Varachha Road, also known as mini-Saurashtra of Surat, against 'Mangadh hatyakand' in which Darbars massacred Patels proceeding to attend a marriage. According to a reporter of *Sandesh*, massive protests were organised against the massacre. Similarly, there were serious repercussions of the anti-reservation agitations of 1981 and 1985. Kathiawadis react militantly whenever their values and identity are under attack.

Recently, a well known Kathiawadi person was arrested and allegedly tortured by the police. He was falsely implicated in a case of firing at the PSI from his revolver in Kapodra police station. In protest, massive meetings were organised and statements threatening the involved PSI were issued in the press. Militant speeches were also made. This went for days. The situation was brought under control only when the two concerned PSIs were transferred by the commissioner of police. However, a small section claimed that the entire agitation was opportunistic and was manipulated by diamond owners and builders (the accused was a builder Mohan Sawant). There are several other instances where the slightest provocation leads to angry and violent reaction by Kathiawadis like pick-pocketing or a minor road accident. Violence and brutal exploitation in their daily life accounts for such outbursts by them on such occasions.

Events and rumours after the demolition of Babri masjid on December 6, 1992, provided a spark to the communally charged atmosphere in the city created by the vicious anti-Muslim propaganda of the BJP, VHP, RSS. Literally, thousands of Kathiawadis took to streets and there was no one to restrain them, including the police. For two full days, looting, rapes, killings and other brutalities were perpetrated by them on Muslims in the name of religion. The Saurashtrian identity also works in another way. During any agitation, diamond factory owners close down their factories and mobilise their workers for the agitation, be it communal riots or anti-reservation stir.

Kathiawadi diamond workers live in extreme poverty. About 60 per cent of them cannot afford to bring their families along to Surat. They live in crowded rooms and share sleeping place. At times, they even stay in the factory. Literacy rate is very low among them. They cannot read or write and spoken word is almost sacred. Repeatedly, sadhus, employers and politicians talk about communal issues and project them as major issues. While other migrant groups do not have a middle class to voice their aspirations, among Kathiawadis this is not the case. They have a middle class and small industrialists in their community. However, this middle class does not articulate aspirations of workers and the silently oppressed. There is no agitation or protest along class lines. In the name of Saurashtra, only communal politics and interests of the elite are pursued.

The Kathiawadis have a strong sense of solidarity and community life which preserves their separate regional identity. This has, as in the case of other migrant communities, developed strong intra-communal bonds. It is this bond of which the upper caste and the diamond unit owners as well as land-grabbers of Kathiawadi origin take advantage to pursue their interests and communal politics. It is this bond emanating from a strong sense of identity in an alien city that today mobilises, almost effortlessly, thousands of Kathiawadis at short notice whenever they perceive danger to their identity from 'aliens'—be they Muslims or police. It is this bond that today makes the Kathiawadi worker stand behind the elites from the community. Ironically, one of the reasons for such strong sense of solidarity and identity is the insecurity of life and employment and brutal oppression at their places of work, including torture and beatings to recover advances and loans and on suspicion of theft. The miserable conditions of living only add to the longing for some sort of collective feeling. Separated from their families, the alienation of the city drives them to various vices like alcoholism, prostitution, and even blue films.

Conclusion

In the riots that followed the demolition of Babri masjid on December 6, 1992, the BJP and Hindutva forces had a strong organisational network and the backing of the Rana, Ghanchi, Kharwa and Machhi communities. These upwardly mobile communities were looking for a broader identification and larger political role which the Congress had failed to provide. The BJP could fill in this vacuum and therefore had the resources of these communities at its disposal. The migrant workers' participation in the riots was out of their insecure living and working conditions.

PUBLIC INTEREST RESEARCH GROUP

Presents

ALTERNATIVE ECONOMIC SURVEY 1993-94

There is no denying that the official Economic Survey has acquired quite a few apologetic traits. Over the years, it has tended to be more of a window-dressing than report objectively and meaningfully the state of Indian Economy. The manner in which the economy affects the lives of the common man is rarely captured in the official survey. Hence, an attempt was made to prepare an **Alternative Economic Survey 1992-93** in 1993. This Survey was very well received by media, economists, activists, NGOs and other groups.

Public Interest Research Group has now brought out **Alternative Economic Survey 93-94** keeping in view of developments during this period. Written by a team of economists, activists, academicians and grassroot workers, the Survey has examined various public policies and suggested alternative packages. This survey has following chapters :

- **The Economy 92-93** *C.T. Kurien*
- **Macro Scene** *Arun Ghosh*
- **NEP:Taking Stock** *Surender J. Patel*
- **Self-reliance and Globalisation** *M.A. Oommen*
- **The External Sector** *Jayati Ghosh*
- **External Debt** *Biswajit Dhar*
- **GATT and India** *B.K. Kealya*
- **IMF-World Bank and India** *Balraj Mehta*
- **Fiscal Policy** *Dalip Swamy*
- **Taxation** *V.Upadhyay*
- **Financial Sector** *Kamal Kabra*
- **Prices and Distribution** *Jaya Mehta*
- **Labour and Unemployment** *D. N. Reddy*
- **Agriculture** *Abhijit Sen*
- **Rural Economy** *Kamala Prasad*

Population and Food *N. Krishnaji*
Industry *S. Muralidharan*
Corporate Governance: Towards *Laissez Faire* *R. Maheshwari*
Power Sector *Surinder Kumar*
Planning and Public Sector *R.C. Dutt*
Women: Politics of Exclusion *Krishna A. Patel*
Gender Perspectives on Development *P. Swaminathan*
Tribals *Pradip Prabhu*
Education *Suresh Shukla*
Higher Education *K.S Chalam*
Health *Imrana Qadeer*
Environment *Ashish Kothari*
Lobbies *Dolly Arora*

DLF CEMENT LTD.

Regd Office : 1-E, Jhandewalan Extension, New Delhi - 110055

Public Issue of 99,13,400 Secured Redeemable Multi Option Convertible Debentures of Rs. 85/- each for cash at par aggregating Rs. 84,26,39,000

ISSUE OPENS ON 22nd JUNE, 1994

PROJECT HIGHLIGHTS

- Promoted by DLF Group occupying prominent position in real estate for the last 45 years apart from interest in engineering industry
- Technical collaboration with Nihon Cement Company Ltd (NCC) Japan for manufacture of 1 4 million tpa of cement. NCC is one of the largest cement manufacturers in Japan having a total capacity of 13 million tpa and a turnover of US$ 1 81 billion (Year ended March 1993)
- NCC technology will provide the benefits of (I) low heat and energy consumption (II) emission levels conforming to International standards (III) waste heat recovery system which will be utilised to generate power for captive consumption and result into substantial cost savings
- Strategic location with limestone reserves available in the vicinity of plant for about 100 years at the rated capacity
- Captive power generation of 15MW to ensure an uninterrupted and consistent supply of power
- Proximity to the cement deficit Northern region and captive consumption by the group
- Professional management comprising of people with diverse experience and proven track record
- Project and site clearances already obtained from environmental angle from the respective authorities on 1 2 million tpa basis (Revised on 1 4 million tpa basis awaited)
- Project viability assessed and appraised by The Industrial Credit & Investment Corporation of India Ltd (ICICI) for 1 2 million tpa. Rupee term loan participation by the All India Financial Institutions
- Foreign currency loan participation by International Finance Corporation (IFC) Washington upto US$ 28 million. Participation in Multi Option Convertible Debentures (MOCDs) upto US$ 8 5 million on firm allotment basis

CREDIT RATING

Crisil has assigned BBB+ (Pronounced Triple B Plus) rating to the captioned debenture issue. This rating indicates sufficient safety with regard to timely payment of interest and principal. However changing circumstances are more likely to lead to a weakened capacity to pay interest and repay principal than for debentures in higher rated categories

ISSUE HIGHLIGHTS

- Multi Option Convertible Debentures of Rs 85/ each Part A of Rs 50/ convertible into 5 equity shares at par on allotment and Part B NCD of Rs 35/ having four options for investors * Option I simple interest of 17% on NCD Portion * Option II cumulative interest of 17% on NCD Portion * Option III — opportunity to convert NCD portion into equity shares. No interest payable on NCD portion * Option IV to dispose off NCD portion of MOCD
- Participation on firm allotment basis in the MOCD Issue upto US$ 8 5 million equivalent to Indian Rupees 26 35 crores by IFC Washington by Indian and offshore mutual funds to the extent of Rupees 17 93 crores and by Foreign Institutional Investors to the extent of Rs 14 25 crores
- The Company has made arrangements for buy back of Non Convertible Portion (KHOKHA) through Hong Kong Bank. The cost of the Equity Shares to eligible allottees opting for the buy back facility would be Rs 11/ per share
- Issue rated BBB+ (Pronounced Triple B Plus) by CRISIL
- Easy and attractive payment terms Rs 25/ on application and balance Rs 60/ on allotment (If not opted for Khoka buy back)
- Listing of shares and debentures at Ahmedabad Bombay Calcutta Delhi Jaipur and Madras Stock Exchanges
- Full promoters contribution of Rs 75 65 crores by way of Multi Option Convertible Debentures
- Tax benefit U/S 80L 80M under Income Tax Act 1961 and Wealth Tax benefits

Investors may note that in the event of the present issue being oversubscribed, the allotment will be finalised in consultation with Stock Exchange at New Delhi, the allotment shall be on proportionate basis and a SEBI nominated public representative shall be associated in the process of finalisation of basis of allotment.

RISK FACTORS

EXTERNAL (TO THE COMPANY)

(i) Profitability may be affected due to changes in Government Policy towards Cement Industry, Exchange Rate Fluctuations and various statutory levies

(ii) Competition from the existing and proposed manufacturers may affect performance and profitability of the company

INTERNAL (SPECIFIC TO THE PROJECT)

(iii) Cost/time over run may affect the cost and profitablity of the project

(iv) The appraisal for the Project has been conducted by ICICI based on the rated capacity of 1 2 million tpa. Subsequently the Company had revised the rated capacity to 1 4 million tpa in order to improve the profitability which has been noted by ICICI. Re appraisal of the Project at the enhanced capacity is to be undertaken later by ICICI

(v) Conversion of Prospecting licence into Mining Lease for limestone is awaited

(vi) RIICO is in the process of acquiring both private and Government land on behalf of the Company as per Memorandum of Understanding signed by the Company with RIICO

(vii) Site clearance and No-Objection Certificate from the Environmental Angle has been received from Rajasthan Pollution Control Board and the Department of Environment for the rated capacity of 1 2 million tpa. The clearance for 1 4 million tpa is awaited

PERCEPTIONS OF THE MANAGMENT

(i) The Company does not foresee any difficulty in marketing its product due to the strategic location of its plant in the cement deficit Region

(ii) Barring unforeseen circumstances, the management is hopeful to complete the project within the projected cost and time estimates

(v) The Company has already filed application for obtaining mining lease and no difficulty is envisaged in getting the same

NRI forms are available at the Registered Office of the Company

If the company does not receive the minimum subscription of 90% of the issue amount including devolvement of underwriters within 60 days from the date of closure of the issue the company shall forthwith refund the entire subscription amount received. For delay beyond 78 days of the opening of the issue in refund of such subscription the company shall pay interest @ 15% per annum. If there is delay in refund amount collected the company and the directors of the company shall be jointly and severally liable to repay the amount due by way of refund with interest @ 15% per annum for the delay beyond 78 days from the date of opening of the issue

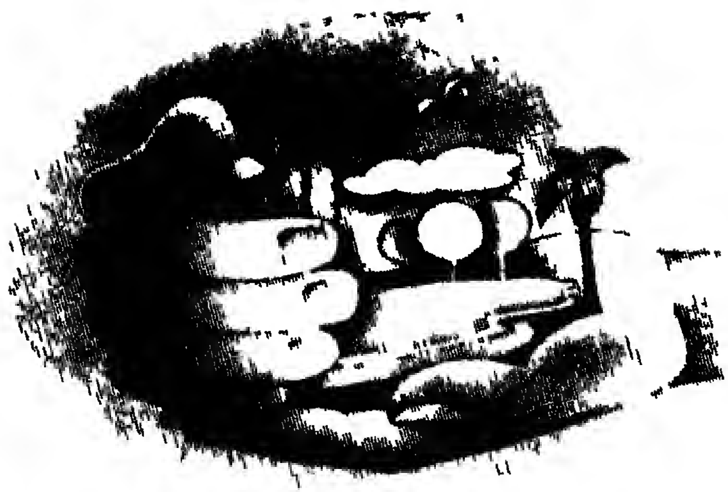
SOUTH AFRICA: A NEGOTIATED REVOLUTION?



We help Nature keep her true colours.

As reputed manufacturers of vital chemical products, we've been in the forefront of promoting safety and environment protection.

Our commitment to preserve the environment, improve safety and enhance the health and welfare of our employees and the surrounding community manifests itself in every facet of our operations – right from our choice of technology to process selection and engineering design.

Effluent treatment plants at both our factories render liquid wastes harmless. Sophisticated pollution abatement equipment keep emissions within tolerance limits.

Our R&D wing develops products that are environment friendly, searches for ways to recycle waste and constantly evaluates the effectiveness of our own pollution prevention and control efforts.

We've designed education programmes to inform, train and encourage our employees to actively participate in achieving safety and environmental protection goals; safety inspections and safety audits to assure continuous control; and onsite and offsite disaster control plans to aid effective response to a wide range of emergencies.

It's all part of our integrated effort to keep our operations safe and harmless.

And to ensure that we help Nature keep her true colours.

Coping with Famine

India provides a good opportunity for analysing famine demography in a historical perspective. While analysis at an aggregative level provides an understanding of short-term demographic responses, examination of inter-district variations helps to assess the relative importance of factors such as drought severity, relief provision, flow of migration, etc, that shape the demographic outcome 1399

Three Years of Reform

Economic reform in India was triggered by an external debt crisis, the outcome mainly of domestic fiscal imbalance Three years of the reform have passed and the impact of some of the policies is visible While three years may be too short a period for assessing the full impact of the policies, for mid-course corrections of the policies it will be too late if their results are not detected in time 1411

Thought Control

Within the emerging maelstrom of media forces in India, our thoughts are being thought for us in ways that make the indoctrination of traditional authority figures almost mild in comparison The fundamentally uncritical valorisation of the market and the state by a range of media representatives constitutes a form of cultural fascism which, while liberal and idealistic on the surface, is most dangerous in the hold it has over people's minds and votes 1389

How Much Is Enough?

The world must finally grapple with the Gandhian question How much is enough? The answer would have to be viable in terms of sustainability and, to be of real practical value, would have to be eventually applicable universally 1383

Child Labourers

Household surveys in West Bengal, Bihar and east UP show that all girl children in rural households are in fact disguised child labourers, with the degree of exploitation varying with socio-economic backwardness 1379

Beyond Gender

Women's studies is about social change and while we focus on hierarchical gender relations, we must also highlight iniquities based on class, caste and creed 1419

Without Trial

The government of India has behaved in a disgraceful manner in regard to the imprisonment without trial of the veteran leaders of Kashmir, Abdul Ghani Lone and Syed Ali Shah Geelani 1373

Cleft Stick

Every year at 'akha teej', the Rajasthan government launches a drive against child marriages The work burden falls on the lowest level functionary, the 'sathin', who is required to report on child marriages taking place so that the police can intervene This is where Bhanwri, a sathin who was gang raped because she tried to stop a child marriage taking place in her village, was caught in a cleft stick 1377

What Next?

While 'negotiated revolution' has become the favourite media expression to describe the transformation in South Africa, not only negotiations but the revolution also has to continue 1375

For Flogging

In showing its approval of the flogging of Michael Fay in Singapore, the 'American public' in whose name the US political leadership performs its heroic deeds has lifted the lid on the can of worms of American authoritarianism 1386

LETTERS TO EDITOR

Triple Talaq Judgment

THE article of Flavia Agnes 'Triple Talaq Judgment Do Women Really Benefit?' (May 14) has raised some interesting questions

Customary law is set against J Tilhari's judgment Customary law may have its own meaning in sociology but Muslim Personal Law (MPL) is different it is based on the word of god and the precepts of the prophet as interpreted by religious and secular (non Muslim)) judges in India The subject has not to be taken in a populist fashion a few vital questions arise for serious thinking which are as follows

(1) What are the limits of MPL and the constitutional law?

(2) Are there any absolute limits set to primacy of constitutional law?

(3) Was MPL given absolute supremacy over Muslims (apart from penal laws which were conceded to IPC) and what is actually saved from the Constitution after 1947?

Infirmity, if any in J Tilhari's judgment should have been shown from 1 2 and 3 points of view

On the points raised by Flavia the legal position is as under

(a) The position under three consecutive monthly pronouncements of talaq would have been certainly different if there had been an opportunity for reflection and reconciliation

(b) There is no question of acquisition of land belonging to a divorced woman Under the Land Ceiling Act the husband s and wife's lands are clubbed together *unless* the wife is judicially separated/divorced The courts have in fact held in this case that there was no divorce As far as the Ulemas are concerned, there is no consensus that triple talaq' in one sitting is a customary divorce (see the Muslim Personal Law Board s description of this type of divorce as criminal action though it accepted contradictorily such divorce because of popular usage)

(c) Once 'triple talaq' is held to be invalid for all purposes, Khatunissa can certainly claim to be maintained by her husband

(d) The doctrine of divorce by mutual consent does not apply here for two reasons

(i) In 'triple talaq' consent of wife is not necessary, and (ii) when the court has held that in fact there was no divorce in the eyes of law the question of consent is not there, the fact that the triple talaq' has not been challenged by husband or wife in this case is irrelevant because the rights of the state are affected by the so-called divorce

(e) In fact on the facts of the case it is apparent that the husband and the wife have lived together If factual presentation is challenged then more evidence should have been produced at the lower judicial level At the level of the Supreme Court this cannot be done

(f) There is no question of the women's right being involved All that is to be decided under Islamic law is whether the husband and the wife have in fact *totally* separated and not cohabited with each other In case of the preferred divorce, for instance, the first 'talaq' is considered to be cancelled *ab initio* if the husband and wife continue to dwell under the same roof From this point of view there is nothing to prevent the wife from walking out from the possession of the residence There is need for an objective test to check that divorce is in fact a *fraud*, as distinct from it *being invalid*

(g) The point is even the requirements of MPL were not met and the divorce was held to be fraud to avoid the Land Ceiling Act In cases of fraud all concepts of minority and customary law become irrelevant

(h) The point that minorities are denied benefits of the Family Courts in Bombay through a faulty drafting of the Family Courts Act does not really arise from J Tilhari's judgment However it is certainly a point which needs consideration by the government and the activists

(i) Regarding the final query raised by Flavia that if the couple are divorced after the property is acquired, will they be entitled to reclaim their property from the state, the obvious answer is that law is not applied retrospectively but it is applied having regard to the position *on the date of the acquisition* and subsequent events cannot alter such legal actions

We hope the above clarifications will be helpful to your readers in understanding the controversy

Big-Time Swindle

THE extremely facile and superficial review of Randhir Singh's book *Five Lectures in Marxist Mode* by Sumanta Banerjee (April 16-23) does little justice to the complexity of issues addressed by Randhir Singh While Randhir Singh rightly seeks to restore the primacy ("in the ultimate analysis") of class-analysis, he does not wish away the socio-historical specificities of the Indian situation It simply would not do to dismiss airily "caste or ethnic loyalties traditions which are being harnessed by small-time political operators and legitimised by new-fangled theories of certain academics" A detailed critical survey of such theories, not all of which have been propounded by cloistered academics, seems to be called for It is important to theorise the relations between caste, ethnic struggles and the class forces in our society today Otherwise 'class-based politics' will get chronically derailed by influences from such spheres

The big question missed by metropolitan big-time journalists of course, is whether such concepts as the Indian nation have any historical validity If India is a national state, then state terror against attempts to disrupt the nation is an unfortunate necessity If, on the other hand, the concept is hollow, or at least inadequate, then the issue of state terror rises above the level of mere legality Then violence by ethnic groups against hegemonic claims of the centralised nation-state will be an altogether different matter

An abstract discussion of the problems of building socialism is of little value Indian leftists are not given to serious research in modern history, and they do not critically re-examine policies followed in the past and their consequences How then can they claim a right to be heard on this issue?

Putting the Clock Back

THE process by which the injectable contraceptive Depo Provera (and Net en) has been introduced into the Indian market makes a travesty of the efforts of concerned and committed women's and health groups to create common ground for the state, people's movements and researchers on issues such as contraception which crucially and intimately affect the lives of women. For the issue here is not merely the approval given to a contraceptive of questionable safety but the gradual erosion of the rights won by the international health and women's movements over the decade and points to the gathering momentum towards the evolution of a lean and mean state.

Let us assemble the facts. Depo Provera (DP) is a controversial contraceptive which is the first of a generation which indubitably transfers control from the woman-user to the administrator-doctor and hence to whatever the authority which controls the medical establishment. Given the powerlessness of women socially, politically and economically, the issue of user control has assumed great importance because it is the real test of whether the rhetoric of empowering women has indeed been translated into accepting that women have and may exercise rights over their bodies, over their reproductive health. The fact is that women's empowerment in the economic and political sphere even if it really materialises does not challenge the patriarchal state apparatus as sharply as does the acceding of reproductive rights to women. By stalling the licensing of DP, women had asserted their right to safe contraception and control over their fertility. The Indian government by allowing the sale of DP and Net en has at one stroke swept the 15-year old unresolved debate under the carpet and encroached upon hard won rights.

Secondly, the entry of DP comes at a time when the Indian government is keen to encourage foreign investments and is hoping for the return and expansion of the drug MNCs. It is also in the throes of accommodating as many of the 'concerns' of interest groups led by the World Bank as is possible without upsetting the balance of political forces. The refurbished population bomb myth is extensively influencing policy decisions. The licensing of the injectables is the red carpet laid out for companies like Upjohn and German Remedies, manufacturers of DP and Net en, respectively. Upjohn, it may be recalled, has had an uphill task getting the contraceptive approved. Its extensive unethical trials in third world countries became the spark for women's and health groups to mount an offensive which ultimately led to a public inquiry, where Upjohn was forced to concede that it had sought USFDA approval on false grounds. Upjohn in submissions to the US Securities and Exchange Commission had in the past admitted that it had paid huge bribes to foreign governments to persuade them to allow the sale of DP to government agencies. Getting the world to accept DP had clearly become a major objective for the company. The Indian government with a long established drug control machinery and a vast middle class population firmly hooked on consumerist dreams of upward mobility and inevitably the small family norm, has opened for Upjohn, riding on an Indian drug firm which has all the right connections, a vast market for a never-done-well contraceptive. In return, no doubt the MNC will offer goodies like sophisticated drug ranges, etc.

The ministry of health has issued a statement, following a high-level meeting which included the Drug Controller of India (DCI), the health secretary, the ICMR chief and "women's representatives", that the drug has been approved after thorough study, trials and post-marketing surveillance. Clearly, the government must mean studies conducted abroad, for ICMR in its annual report of 1975 had reported the abandonment of the only trials it had ever undertaken, because of the high drop-outs due to heavy and prolonged bleeding or amenorrhoea. In fact, the drug controller is reported to have said that the approval was given entirely on the basis of material supplied to the authorities by Upjohn. The DCI has also contended that field trials of contraceptives do not give sufficient information about acceptability, which, as for any consumables, can only be assessed after it is introduced. Not only is this a shockingly irresponsible attitude, but it makes a mockery of the entire structure of drug testing with its elaborate and internationally accepted sequence of trials. So far India has stood out among third world countries in having an independent mechanism for assessing drug safety and acceptability, even though it is often sought to be circumvented by drug companies. This decision of the drug control authorities to license the two controversial contraceptives is tantamount to the first step towards dismantling the drug licensing system.

This suspicion that the state is moving towards shedding its responsibility of ensuring that a drug introduced in the market is indeed safe is strengthened by other developments. For instance, that the contraceptive is to be distributed through the Family Planning Association of India (FPAI) and the NGOs who will either buy it or will be gifted the same by aid agencies, all of whom are concerned about the population explosion, has been underplayed for obvious reasons. For, this means that women who cannot afford the drug will also be at risk from its use through the NGOs, who could even be set up for the purpose, and the FPAI clinics. And worse, since the government has no mechanism to monitor or control the activities of the NGOs, it will not be liable in case of damage due to use of the drug or its administration. In such circumstances, to what extent can the drug control administration ensure that adequate and reliable post-marketing surveillance be done? It is well to remember that adverse drug monitoring mechanisms are only now being created and they have to contend with numerous problems in a health care system which is becoming increasingly unregulated and chaotic. By licensing the injectables for manufacture and sale, the government has circumvented the need to strengthen the ethical base of its health care operations, and absolve itself of charges of the kind that have been made about its family planning programme so far.

For all these reasons it is imperative that a broad-based opposition be mounted, which includes not just women's and health groups, but other progressive movements and the large number of NGOs who have been so vocal and visible in the numerous preparatory meetings for the Cairo conference on population and development.

BY-ELECTIONS

Mixed Bag

THE results of the recent by-elections to the Lok Sabha and state assemblies are said to have generally gone in the favour of the Congress(I). A closer look at the results, however, reveals a pattern that is more complex.

Going by the number of **seats alone, the Congress has** certainly done well in the Lok Sabha elections, winning five of the seven constituencies that went to the polls But while two of these victories were recorded in Maharashtra, the voter turnout (25 per cent) in both the Baramati and Ahmednagar(south) constituencies here was the lowest so far, a factor that may have worked to the advantage of the Congress Further, while Sharad Pawar had secured 84 4 per cent of the votes polled in the constituency in the last elections, the Congress candidate this time, Bapusaheb Thite, has managed only 60 per cent. Similarly, in both the Kurnool (Andhra Pradesh) and Mayurbhanj (Orissa) Lok Sabha constituencies Congress candidates have recorded victories with lower margins as compared to the previous elections. In Kurnool, a traditional Congress(I) stronghold, Kotla Suryaprakash Reddy, son of chief minister Vijaya Bhaskara Reddy, won by a margin of 19,646 votes whereas in 1991 his father got elected with a margin of 52,000 votes. Detailed figures show that the Telugu Desam Party has made inroads into the Congress vote-bank in three out of the seven assembly segments in the constituency. Similar inroads were made by both the Janata Dal and Jharkhand Mukti Morcha (Sibu Soren) in the Congress(I) vote-bank in Mayurbhanj. While in the last elections the Congress had won the seat by a margin of 49,000 votes, this time its candidate Sushila Tiria polled only 23,471 votes more than her JD rival. On the other hand, the JD and JMM improved their share of the votes cast from 23.32 per cent to 29.09 per cent and from 10.37 per cent to 15.79 per cent respectively. These results have sent shivers down the spines of Congresspeople who have themselves described the performance of the party here as poor.

However, it is when we come to the assembly election results that the inadequacy of the Congress(I)'s performance is really pronounced The only states where the party has fared creditably are Madhya Pradesh and, to some extent, Punjab. Its candidates in the Chachoda and Nakodar constituencies, res-pectively, won by impressive margins, though the importance of its victory in Nakodar was diminished when it lost the subsequent election in Ajnala to Akali Dal(Badal) by a big margin. Of the remaining three assembly seats that the Congress has bagged, the victory in Hamirpur (Himachal Pradesh) and West Angami (Nagaland) was by negligible margins and can be attributed to certain local factors which, under slightly different circumstances, could have resulted in the party's defeat. The third seat, from Serampore (West Bengal), was retained with a significantly reduced margin.

In the rest of the states where assembly by-polls were held, namely, UP, Tamil Nadu, Kerala and Rajasthan, the Congress or Congress-supported candidates were either not in the reckoning at all or were badly defeated. In UP, four out of the six contested seats were won by the ruling SP-BSP combine, while the remaining two seats went to the BJP which wrested one seat from the former while ceding another to it in a similar fashion. Looked at in conjunction with the BJP's victory in the Meerut Lok Sabha constituency, where its candidate defeated his nearest Janata Dal rival by more than 85,000 votes, this confirms the trend established in the 1993 assembly polls which brought the SP-BSP combine into power but indicated a consolidation of the BJP vote-bank. It shows, in other words, that despite the Ayodhya issue having lost some of its political lustre, the BJP has lost none of its popularity in the state. In this context, the party's victory from the Rajakhera constituency of Rajasthan by 9,584 votes cannot be ignored.

In Tamil Nadu, the most spectacular performance came from the newly-formed Marumalarchi DMK (MDMK) of the rebel DMK leader V Gopalasamy. While both the Perundurai and Mylapore constituencies have been won by the candidates of the ruling AIADMK, it was given a stiff fight by the DMK and MDMK, especially the latter which secured 23,452 votes in Perundurai to come second while polling 10,500 votes even at Mylapore. From this, it appears that the AIADMK owes its victory primarily to the split in the DMK. As for the Congress, it lost its deposit in Perundurai.

Perhaps the only saving point for the Congress in the deep south was the narrow margin of defeat of the ruling United Democratic Front (UDF) candidate in the Guruvayur constituency in Kerala. The UDF candidate A Samadhani, fielded by the IUML which is a part of the front, lost to an independent candidate, backed by the Left Democratic Front (LDF), by 2,052 votes. However, even here the credit for the narrow margin of defeat of the UDF candidate cannot be given to the Congress, for by soft-pedalling the Ayodhya issue, chief minister K Karunakaran seems to have gifted away a number of Muslim votes, traditionally split between the Congress-IUML and the Left Front, to Islamic parties like the People's Democratic Party (PDP) which won over 14,000 votes. This resulted in a reduction in the vote share of the LDF too, which, despite the victory of its candidate, secured only 34.88 per cent of the polled votes as compared to 40.78 per cent in 1991.

Overall, while poll results do not necessarily favour the Congress(I), they fail to provide any other clear-cut pattern either, making it difficult to predict, on the basis of these results, the performance of the parties in the next round of elections.

GOLD AND SILVER

What Have Liberal Imports Achieved?

STOCK markets and real estate apart, the one segment of economic activity to boom as a result of the economic reforms programme is trade in bullion. The demand for gold and silver has been boosted by the restraint on their relative prices, thanks to enhanced supplies through liberal imports. Internationally gold is now considered less effective as a hedge against inflation. Western central banks sold 635 tonnes of gold in 1992 and 475 tonnes in 1993. If gold production has been lower in the former USSR, South Africa and other gold producing countries, the demand for gold in the developed markets of Europe and Japan has also been slack. While there may have been some revival of buying interest in gold from investors and speculators in Europe and North America as a result of reduced interest rates and subdued conditions in their stock markets as well as real estate markets, the long-term trend in international prices of gold and silver has been a declining one. It is the steady erosion in the book value of their gold assets which has prompted many central banks to dispose of gold from their stocks.

Even so, the World Gold Council and other international agencies engaged in promoting trade in gold are buoyant because of the Asian markets in general and those of India and China in particular. In Asia the propensity to hold gold and silver is determined to a great extent by non-economic factors. Before the officially permitted imports began, Indian prices of gold and silver had been rising, even when international prices were falling, as a result of restricted supplies. Between 1980-81 and 1991-92, the annual average of gold price in the London market steadily fell from $ 585 per fine ounce to $ 357, a loss of nearly 40 per cent and that of silver in the New York market came down from 1,585 US cents to 409 US cents per ounce, a loss of nearly 75 per cent. But the average price of gold in the Bombay market rose from Rs 1,522 per 10 gm in 1980-81 to Rs 4,298 per 10 gm in 1991-92 and that of silver went up from Rs 2,617 per kg to Rs 7,332 per kg—a rise of over 180 per cent or nearly 10 per cent per annum in each case. Though the high and rising domestic prices made smuggling lucrative, they placed a limit on the absorption of the metals in the domestic market. But with import of gold officially permitted from March 1992 and of silver from February 1993, supplies have been tremendously augmented and the pressure on domestic prices has eased. Between March 1992 and May 1994, while the international prices have shown a slight uptrend (from $ 344.64 to $ 384.00 per fine oz of gold and from 450 US cents to 547 US cents per oz of silver) domestic prices have generally remained subdued (Rs 4,443-Rs 4,670 per 10 gm of gold) or fallen (from Rs 8,050 to Rs 7,029 per kg of silver).

Both the easy availability and subdued relative prices have thus gone to stimulate absorption of gold and silver in the Indian market. It was hoped that liberalisation of import of gold and silver would minimise smuggling, prevent diversion of foreign exchange into illegal channels and wipe out the 'havala' rupee rate for the dollar Nothing of the sort has happened The 'havala' rate is currently Rs 35.50 per dollar for dollar instruments and Rs 33 50 per dollar for cash Even the hope of collecting some revenue from the import of the precious metals has not been realised Initially, the import duty on gold was put at Rs 450 per 10 gm (or about 10 per cent of the ruling market price in India), but it had soon to be reduced to Rs 220 per 10 gm The duty on silver is Rs 500 per kg (roughly 6 to 7 per cent) The bullion trade had been putting tremendous pressure on the Maharashtra government to reduce the sales tax on bullion on the ground that other states had lower rates Conceding the demand, the overall incidenee of state levies (including 0 3 per cent surcharge for the earthquake relief fund) has now been slashed from 3 75 per cent to just 0.8 per cent

The bullion trade has been emphasising that even at the reduced import duties official import of gold and silver is not profitable In other words, there is a continued rationale for gold smuggling Smuggling of gold into India was estimated at 150 tonnes in 1991 After the repeal of the Gold Control Act by Madhu Dandavate as finance minister in March 1990 and the permission to import gold in March 1992, absorption of gold in the Indian market shot up to 259 tonnes in 1992 (166 tonnes of smuggled gold and 93 tonnes of legal imports) The latest annual report of the London based Gold Fields Mineral Services, which provides authentic information on movements of gold the world over, suggests that India absorbed 238 tonnes of gold in 1993—122 tonnes via smuggling and 116 tonnes officially (not counting 19 tonnes under the replenishment schemes for exports)

Similarly, the New York firm Handy and Harman's annual report on the world silver market in 1993 has estimated that India absorbed as much as 3,267 tonnes of the white metal during the year as against 1,754 tonnes in 1992 and 1,360 tonnes in 1991 Of 3,267 tonnes, 498 tonnes were smuggled The report emphasises that "India has been the most important swing factor in the silver market in recent years", which had gone to help the average price of silver to rise by about 9 1 per cent in the New York market from $ 3 94 per ounce in 1992 to $ 4 30 per ounce in 1993 The easy availability of silver has significantly stimulated not industrial demand but non-industrial demand in India in the form of jewellery and silverware Non-industrial demand zoomed from 818 tonnes in 1991 to 998 tonnes in 1992 and 1,695 tonnes in 1993

The bullion markets have received a further impetus in 1994 as a result of the special import licence (SIL) scheme introduced as an incentive for exporters The government-owned Minerals and Metals Trading Corporation (MMTC) has declared that it would aggressively use this facility The company is intending to expand its distribution system for precious metals and its sales would be open to "anybody including dealers, refiners, merchants, traders, jewellers and individuals" The State Bank of India (SBI) and MMTC have been administering a replenishment scheme for import of gold against jewellery exports under which 19 tonnes of gold were imported in 1993

The implications of liberal import of gold and silver for the domestic economy are indeed depressing bullion imports now absorb as much as Rs 13,500 crore or more than one-fifth of net household sector saving in the form of financial assets

WEST BENGAL

Twisted Economics

A correspondent writes

IF Marxists regard economics as the quintessence of politics, non-Marxists, not excluding anti-Marxists of course have no compunctions about twisting economics to suit the needs of their political tactics of the day Witness, for instance, the *obiter dicta* of the union finance minister in the course of his indictment of the West Bengal Left Front government

In the first ever public meeting he has held in West Bengal, Manmohan Singh chastised the Left Front govemment for its failure to generate employment, attract new investment and set up new industries in the state during the last 17 years of its tenure As if taking the cue from him, *The Economic Times* a few days later held the Left-leaning ideology of the state government responsible for stifling the entrepreneurial spirit that used to flourish in this region in the past and for creating a situation in which "industry fled, wealth diminished, infrastructure collapsed, unemployment rose and the educated jobless had nothing better to do than argue ideology "

Even if this be accepted as a true picture of this state today, the rot certainly did not start with the coming in of the Left Front government in 1977, nor is it persisting due to the present government's policies alone, if at all For people with a short memory, it may be useful to quote a few points from a longish analytical account published in 1971 by the Bengal Chamber of Commerce and Industry, Calcutta, hardly to be regarded as blind admirers of the communist-led Left Front, in order to trace the real reasons for West Bengal's present economic malaise

In the early 60s, the study said, the (historical) "tendencies of decline in the economy of West Bengal were further aggravated by the phase of sluggishness in the Indian economy West Bengal appears to have been hit the hardest among all states of the Indian union" After noting the fact that the recession had started earlier in West Bengal and that the total registered factory employment in the state had increased by only 20,000 during the nine-year period 1951 to 1959, it underlined the fact that factory employment declined by 40,000 in just one year in 1965. Then the Bengal Chamber publication quotes some revealing passages from the authoritative Report of the Survey Committee on the Engineering Industry in West Bengal.

"The fall in industrial employment, particularly in the engineering industry, and the accompanying stresses and strains reflected themselves through the increasing tempo of labour troubles during the year 1967 " "The mounting industrial disputes had their spread effect," the report goes on, 'throughout the manufacturing industry of the state, including those units which were not yet affected by the recession The buyers from other states felt nervous and hesitant in placing their orders with the industrial units in West Bengal for fear of non delivery in time . "

Then of course came the two United Front govemments accompanied by the famous phenomenon of gherao The Bengal Chamber publication quotes a study (by the late Nitish R De) which says, "Despite the wide publicity an estimate shows that only about 10 per cent of the industrial establishments were affected by gheraos' in 1967 neither the white collar clerical employees, who are highly politicised and actively unionised, nor the employees of such establishments as are nurtured in a culture of collective bargaining participated in the ['gherao] movement, despite their left political leanings " (see *West Bengal An Analytical Study* sponsored by the Bengal Chamber of Commerce and Industry, Oxford and IBH 1971, pp 113-18)

If in blaming the 17 year left rule for the industrial decay in West Bengal, Singh is doing less than justice to his own economic acumen for the sake of scoring a point or two of tactical-political advantage, the other side also has not displayed signs of a more profound understanding Even though Jyoti Basu has had two Marxist economists as his finance ministers during the 17-year period, the Left Front government has not displayed an understanding of the depth of the inherited crisis, instead the chief minister has been looking to a miracle to be achieved with the assistance of the IMF World Bank TNCs and NRIs, along with Indian big business Hence the Left Front has been unable to turn around the spearhead of the attack against them

TAXATION

Not Radical Enough

THE conference of state finance ministers the central ministry of finance convened was slated to discuss principally the proposal of the Tax Reforms Committee, also known as the Chelliah Committee, for a national-level value added tax in place of the present system of domestic commodity taxation comprising excise duties levied by the centre and sales taxes levied by the states The Chelliah Committee did not think that its proposal for a national level value added tax would pose any insurmountable problems not even with respect to the present division of functions

and powers under the constitution between the union and the states. It would appear, however, that the committee got carried away by its enthusiasm for the changeover.

The constitutional hurdles might not be as easy to overcome as the committee gave the government to understand. This comes out not only from the proposals forwarded by the National Institute of Public Finance and Policy (NIPFP), the institute commissioned by the government to come up with a concrete measure; the deliberations of the one-day conference should also have convinced the finance ministry how hard it will be to bridge the gap between the centre and the states on the subject. All that has been agreed upon (if at all it can be so described) is to set up a committee to go into the question of value added taxation. The NIPFP had reportedly cautioned against a national-level value added tax and has instead suggested a two-level levy, one at the central level and the other at the state level, each with its own offset provisions in regard to input taxation at the respective level, but with no provision for cross-offsets.

It is interesting that both the Chelliah Committee and the NIPFP fought shy of more radical solutions to the problems which are supposed to beset existing commodity taxation. The principal problem with the existing system is that with no adequate offsets for input taxation, cascading results. Also, with both central excises and state sales taxes being largely based on the origin principle rather than the destination principle, the benefits of revenue accrue to the producing regions rather than the consuming regions which are really the ultimate tax-payers.

The question still remains whether these two problems could not be attended to within the existing system. As far as the problems of cascading is concerned, the really radical solution would lie in the direction of the centre forsaking excise taxation in favour of the states in return for the states undertaking to give complete offset for input taxation. That would also lighten the task of the Finance Commission. The second problem, namely, of inequity between states in revenue accretion, could perhaps be tackled through some sort of pooling of a portion of the total revenue collection and its redistribution on an equitable basis. For consignment tax, the states had agreed to a sort of pooling which would have come into effect but for the opposition from the finance ministry mandarins headed by Chelliah and a few states anticipating return favours from the centre.

Basically what is called for is a radical restructuring of the distribution of taxing powers between the centre and the states and that can come about if the centre forgoes the power to levy excises.

PANCHAYAT RAJ

Only a Shell

ON April 23, Rameshwar Thakur, minister of state for rural development, could not contain himself while announcing that all states had passed legislation on panchayat raj that brought them in line with the 73rd Constitution Amendment Act, 1992. "A new chapter", he claimed, "has been written" in the political history of the country.

When the panchayats in rural areas and nagarpalikas (municipalities) in the urban parts become functional, there will, according to Rameshwar Thakur, be as many as 30 lakh elected representatives of local bodies; of these at least 10 lakh will be women. One-third of all chairpersons of local bodies will also be women. Likewise, scheduled castes and scheduled tribes will be represented according to their proportion in the population in the membership and chairpersonship of the local bodies. All this, Thakur exulted, meant that "a new chapter in addressing social justice will have been opened".

Rameshwar Thakur was clearly carried away by the mere fact that the states had passed legislation that was supposed to conform to the requirements of the constitutional amendment on panchayat raj. It is very doubtful if either he or his department had had time to examine the various state legislations. Nor apparently had he found time to read the reports from various states in regard to the public debate which the proposed laws had provoked before their enactment. If he had cared to read such reports, he would have been more circumspect in making the claims he did.

Take the case of Kerala's Panchayat Raj Bill which, as Thakur told newspersons, was passed at 5 a m on the 23rd after a marathon 36-hour session. The only thing the Kerala bill does is to legislate the rural local bodies permanently into existence by providing that elections to these bodies will be held at regular five-year intervals, that if they are dissolved fresh elections will be held within six months, and that women and scheduled castes and scheduled tribes will have the minimum stipulated representation. But all these create a shell only. What is it that the state legislature was prepared to put inside this shell? One has only to look at the list of subjects proposed to be transferred to village panchayats for the purpose. There is hardly any subject of substance that the state government is willing to devolve to the local bodies—even in the field of education, health and social services, leave aside subjects like public works, agriculture, irrigation and industry. And whatever is being proposed to be transferred is to be controlled, supervised and monitored by the bureaucracy. Every panchayat body is required to send its budget for the approval of the designated bureaucrat. Not just that. The panchayat body is obliged to include in its budget what the bureaucracy demands. And if a body is recalcitrant, the Kerala act has enough provisions to be invoked for even the dismissal and disqualification of chairpersons and members.

If the Kerala act is the model which other states have followed—the Kerala government claims to have very nearly followed the example of Karnataka—then all that can be claimed for the state legislations is that a huge farce has been enacted. The Nagarpalika Bill now on the anvil in Kerala confirms all the suspicions about the real intentions of the state government in regard to devolution of powers.

SOUTH AFRICA

Undeserved Credit

A correspondent writes:

INDIANS of all hues and many denominations are too keen to remind the world about Mahatma Gandhi's contributions to the eventual liberation of the black people of South Africa from the pernicious racist white rule, climaxed in the final decades by the more atrocious apartheid. In this they, however, pay scant regard to the historical truth. Gandhi, of course, played a most heroic role in fighting the racist South African regime almost from his first interface with it till he finally left the country after about two decades' stay. But he fought mainly for the rights and dignity of the Indian settlers, occasionally for some other Asians, particularly the Chinese, but never, repeat never, for the blacks.

Arriving at Durban at the end of May 1893, he had his first, and successful, encounter with the white rulers on his right to wear a turban, his usual headgear at that time. His next encounter was the celebrated occasion of his railway travel. In this also he succeeded in winning for Indians, "who", however, "were properly dressed", the right to travel by the first and second class. For the next 20 years he continued to fight the humiliating discriminations against the Indians and in squeezing from the infamous racist regime one concession after another by a skilful combination of mass actions and legal-constitutional battles which extended over three continents, covering, as it did, apart from South Africa, India and Britain as well. But as already mentioned, he never uttered a word or did anything about oppression of the black natives.

Indeed, he had rather gone to the other extreme of backing the white rulers in their offensives against the blacks. In 1906 when the Zulu rebellion broke out, he offered his own services and exhorted Indians to volunteer their services to the white government. He rationalised his action in blatant terms when he said: "We are in Natal by virtue of British power. Our very existence depends upon it. It is, therefore, our duty to render whatever help we can." As is well known, Gandhi, given the rank of sergeant-major, personally led the ambulance corps he had raised.

Nelson Mandela's occasional reference to his debt to the Mahatma may perhaps be cited in defence of the indefensible credit sought by the Indians. Mandela probably refers to the lessons he may have drawn from Gandhi's non-violent mass struggles. Even in this context, it should not be glossed over that in India as well as South Africa the final outcome owed not a little to the non-non-violent struggles of the masses that had gone all along with the non-violent actions. Gandhi's admirers should display some addiction to the truth which was a hall-mark of the Mahatma's lifelong experiments.

Suraj Securities

SURAJ SECURITIES AND FINANCE which is presently engaged in various financial services like leasing, securities, trading, merchant banking, etc, now plans to expand its activities to include bill discounting, hire purchase, bridge financing, etc. The company has already obtained SEBI Category I Merchant Banker status For the year 1992-93 the company earned a net profit of Rs 17 lakh on a total income of Rs 21 lakh while for the nine months ended December 31, 1993 net profit rose to Rs 40 lakh on a total income of Rs 60 lakh The company plans to finance its total requirements of funds aggregating Rs 5 7 crore through internal accruals of Rs 2 4 crore and a public issue of equity shares of Rs 10 each at a premium of Rs 7 per share The issue aggregating Rs 3 3 crore will open for public subscription on June 8

Zodiac Clothing

A government recognised export house, Zodiac Clothing Company has been promoted by M Y Noorani and associates The company manufactures ready-to-wear men's clothing at its 100 per cent export-oriented unit in Gujarat and markets it under the brand name 'Zodiac', a name well known not only in India but also in the international market In addition to exporting over 90 per cent of its production to European countries like Germany, Switzerland and the UK, the company has also recently made a foray into the American market In the domestic market the company markets its products through its subsidiary which is a licensee of the brand name 'Zodiac', owned by Metropolitan Trading Company The promoters now plan to enter the capital market on June 8 with an offer for sale of 8,48,000 equity shares of Rs 10 each at a premium of Rs 110 per share aggregating Rs 9 3 crore.

Vadilal Dairy

Promoted by the house of Vadilal, Vadilal Dairy International was incorporated in 1987 and presently manufactures ice creams under the brand name 'Vadilal' The company is now diversifying into raw milk processing for manufacturing milk, butter, cheese, ghee, malted milk food, infant milk food, skim milk powder and casein and is setting up a 2.5 lakh litres integrated dairy for the purpose. The company has entered into a technical know-how agreement with Ault Foods of Canada and has also entered into a marketing agreement with Vadilal Milk Products, a Bombay-based marketing company The project which is being set up at a total outlay of Rs 25 crore is expected to commence commercial production by October this year To part finance the project the company is entering the capital market on June 7 with a public issue of 14 lakh equity shares of Rs 10 each at a premium of Rs 20 per share aggregating Rs 4 2 crore

KMF

KMF (formerly Kuku Motor Finance), a Delhi-based company promoted by Surendar Kumar Chadha, Kamlesh Vaid and Kavita Chadha, is engaged in the business of merchant banking and leasing of automobiles, including commercial vehicles, in addition to office equipment and machinery The company now plans to expand its fund-based activities and the total requirement of funds aggregating Rs 9 2 crore is to be partially financed through a public issue of 30 lakh equity shares of Rs 10 each at a premium of Rs 2 per share The issue aggregating Rs 3 9 crore will open for public subscription on June 10

Anco Communications

Anco Communications, a Bangalore-based company, was incorporated in 1986 and is presently engaged in the manufacture of terminal equipment The company is entering the capital market on June 10 with a public issue of equity shares of Rs 10 each at par aggregating Rs 2 75 crore to part finance the expansion of its production capacity. In addition to the expansion which envisages increasing the capacities of existing products like digital switching systems and associated main distribution frame and three channel open-wire carrier systems the company is also planning to broaden its product lines by introducing 2/15 shared radio systems 8 channel o/w carrier systems optic line terminating equipment digital multiplexes and tone-pulse switchable telephones The company has already received orders worth Rs 9 crore and it plans to market its products directly to the DoT The project which is estimated to cost Rs 5 1 crore is expected to commence commercial production by August this year

Mayur Uniquoters

Promoted by Mayur Leather Products, S K Poddar and R V Gupta Jaipur-based Mayur Uniquoters is engaged in the manufacture of natural leather shoe uppers The company is now setting up another project for the manufacture of PU/PVC synthetic leathers at a total cost of Rs 9 9 crore at Jaipur Out of the total installed capacity of 6 million linear metres per annum, 4 million metres will be for PVC coated synthetic leather while the balance will be for polyurethane (PU) synthetic leather The plant and machinery which is to be procured from Matel Srl Italy will have special features such as electronic thickness controllers and double ventilation ovens Commercial production is expected to commence this month To part finance the project the company plans to tap the capital market on June 9 with a public issue of equity shares of Rs 10 each at par aggregating Rs 3 crore

Industrial growth has started edging up, but the turn-round is partly statistical, it is also restricted to some basic intermediate and durable consumer goods industries Investment-related capital goods industries and mass consumption non-durables continue to show negative growth Among infrastructure industries, except thermal power and cement, others have experienced a setback As a result overall industrial growth in 1993-94 (Apr-Jan) lagged behind even the previous year's poor performance Government/public sector consumption and investment remain sluggish and continue to dampen industrial growth, even as foreign exchange reserves and liquidity grow rapidly and the inflation rate remains high

KESORAM INDUSTRIES

Coping with Recession

KESORAM INDUSTRIES (KI), the flagship company of the B K Birla group, is a highly diversified company manufacturing automobile tyres and tubes, rayon yarn and cellophane paper, refractories, cement, textiles, spun pipes, etc. Profitability took a severe beating in 1992-93 with the company posting a net loss of Rs 24.4 crore despite a 40 per cent rise in net sales over the previous year.

Ironically the company's tyres division, Birla Tyres, which accounts for between 40 to 50 per cent of total turnover was responsible for both the rise in turnover as also the loss suffered by the company. Set up at a time when the tyre industry was going through a severe recession due to the recession in the automobile sector, the division has also had to cope with rising costs on the one hand and low offtake due to low demand on the other. Further, an adverse duty structure and keen competition in the industry leading to low prices have led to severe pressure on margins. Exports which accounted for up to 20 per cent of the division's production failed to prop up profitability as international markets, though faring better than the domestic market, are not remunerative. Erratic, intermittent and irregular availability of raw material coupled with low offtake took its toll of the performance of the company's spun pipe section. Further, disturbed labour relations at the unit led to closure of the factory from September 1992.

Sluggish demand, unremunerative prices, severe power cuts and steep cost increases affected the profitability of the company's cement units. Moreover, the full impact of the increase in rates of royalty on limestone from February 17, 1992, in coal from July 31, 1991 and excise duty from March 1, 1992 further aggravated the situation. Production at the company's plant in Andhra Pradesh which is a surplus state in cement production fell from 7.5 lakh tonnes of cement and 7.3 lakh tonnes of clinker in 1991-92 to 6.9 lakh tonnes of cement and 7 lakh tonnes of clinker in 1992-93. Inadequate wagon supply, severe power-cuts ranging from 40-60 per cent for almost eight months in a year, .lower cement prices and the extra transport cost incurred on moving surplus stocks to consuming centres led to pressure on the division's margins. Though production at the Vasavadatta cement plant was marginally higher than in the previous year, production was again affected due to poor quality of coal, inadequate wagon supply and severe power-cuts.

The recessionary trends in the rayon market in the first half of the year under review and the close down at the company's rayon and transparent paper sections due to labour unrest affected the operations of the section and even export demand failed to bolster its performance due to unremunerative prices. Offtake at the transparent paper section was stagnant while the increased availability of cheaper substitute films in the market threatened to cut into its market share. The communal violence in Calcutta in December 1992 affected the offtake of the textile division's cloth and yarn, though the unit improved its performance in the first half of the year. Operating profit rose by 72 per cent, but a 158 per cent increase in interest charges and a 182.4 per cent higher depreciation provision led to a sharp fall in net profit. Despite the loss the company has declared a dividend of 10 per cent by dipping into reserves.

Meanwhile, the company has completed installation of the second fluidised bed boiler at the textile division, benefits of which will be noticeable in 1993-94. The company is examining the viability of diversification of its refractory section to cater to the future needs of refractories and it also plans to expand the Vasavadatta cement plant's capacity by six lakh tonnes in due course. A new company has also been formed by KI, Century Textiles and two other companies of the B K Birla group to run and operate the Birla tyre unit from April this year. According to the agreement between KI and the new company, the latter will pay a lease rental amounting to about Rs 36 crore per annum to KI. In order to resolve its liquidity problems the company has reportedly hived off a substantial portion of its Indian Rayon holdings to fetch about Rs 22-24 crore. Further, in order to meet increased working capital requirement the company entered the capital market in January with a rights issue of 51,55,171 17 per cent secured redeemable non-convertible debentures of Rs 100 each attached with one detachable equity warrant.

For the first six months of 1993-94 the company suffered a net loss of Rs 11.1 crore on net sales of Rs 341.6 crore as against a net loss Rs 5.5 crore on net sales of Rs 286.5 crore in the corresponding period last year.

ORISSA CEMENT

Low Government Offtake

Incorporated in 1949, Orissa Cement is engaged in the manufacture of cement, refractories, reinforced cement, concrete pipes, etc. The company markets its cement under the brand name of 'Konark' and refractories under the brand name of 'Dalmia'. With net sales remaining stagnant in 1992-93, net profit fell alarmingly by more than 50 per cent over the previous year.

Production at the company's cement division at Rajgangpur in Orissa was stable at 5,84,000 tonnes (5,87,000 tonnes) of clinker and 6,49,000 tonnes (6,51,000 tonnes) of cement while sale of cement was lower at 6,40,000 tonnes as against 6,52,000 tonnes sold in 1991-92. With the consuming industries updating technology, demand for refractories in the private sector has been decreasing over the years while public sector units prefer sourcing their requirement from other public sector units. Though production at the company's refractory division was stable at 72,000 tonnes (73,000 tonnes), sales fell to 68,000 tonnes (75,000 tonnes) due to sluggish demand. This coupled with severe competition and diminished price realisation led to pressure on margins and the company's operating profit fell by 27.2 per cent. Higher resort to short-term loans by the company (mainly from UTI) led to a sharp increase of 33 per cent in interest charges. Further, with a gross fixed assets formation of 10.1 per cent for the year, depreciation charges also rose by 10.3 per cent leading to a 60 per cent fall in profit before tax.

Even a 71 per cent fall in tax liability, which amounted to 30.3 per cent of profit before tax, could not stop net profit from plummeting. Further, the excise authorities have issued a showcause notice to the company demanding a differential excise duty amounting to Rs 10.9 crore on the special cement sold by the company between April 1982 and October 1988. The company however obtained a court injunction staying the proceedings before the excise authorities. The fall in profitability forced the company to cut the dividend rate from 40 per cent last year to 25 per cent in 1992-93.

Despite its poor performance on the domestic front, the company's exports rose by 40 per cent and it exported 14,662 mt of cement valued at about Rs 2 crore to Bangladesh and Nepal. The expansion project undertaken by the company at its cement plant to increase its capacity from 5.25 lakh tonnes to 6.5 lakh tonnes was completed in the year under review and it is now implementing another project to enhance its capacity further to 8 lakh tonnes per annum. Slag dryer facilities have also been set up while the high efficiency separators together with ESPs have been commissioned. Encouraged by the benefits derived from its technical collaboration agreement with Tokyo Yokyo Company of Japan, the company entered into another agreement with TYK Corporation of Japan, a leading manufacturer of sophisticated refractories in Japan, for castable, precast and lance pipes. Further, in order to enter the field of continuous casting refractories it ordered a cold isostatic press which was

* 15 months.

expected to be installed and commissioned in 1993-94. With the company successfully executing the order from Durgapur Steel Plant, the latter has placed repeat orders for their balance requirement.

Though import duty on refractory raw materials was reduced to 50 per cent by the government, duty on refractories themselves was also simultaneously reduced which may lead to increased competition from imports in 1993-94. Further though production in 1993-94 was expected to be higher on the enhanced capacities, the adverse conditions prevailing were also expected to continue.

For the first six months of 1993-94 the company's performance has worsened. With government demand accounting for up to 40 per cent of aggregate demand, low government offtake due to the resources crunch coupled with the rising manufacturing costs have led to a poor show by the cement industry as a whole. While the company's net sales fell by about 17 per cent from Rs 98 crore in the corresponding period last year to Rs 81 4 crore, net profit fell by more than 55 per cent to Rs 2.9 crore (Rs 6.4 crore).

SIPTA COATED

Push for Exports

Sipta Coated Steels is engaged in the manufacture of GP/GC sheets/coils, cold rolled (CR) steel strips, hot rolled coils, etc. As in the previous year, the profitability of the company continued to suffer in 1992-93 (15-month period) as margins were under severe pressure due to the stiff competition resulting from excess installed capacity in the galvanising industry. Though net sales rose by 16.7 per cent on an annualised basis over the previous year, a sharp increase in operating expenses resulted in a 23.7 per cent (annualised) fall in the company's operating profit. Though operating and net profit margins rose marginally over the previous year they stood at a mere 3.4 per cent and 0.9 per cent, respectively. If despite this gross and net profit rose, it was mainly due to a large non-operating profit amounting to Rs 5.3 crore in 1992-93, a major part of which emanated from sale of assets.

Meanwhile the company's products have reportedly been well received in the overseas market and the company has several orders on hand. It hopes to improve profitability through higher emphasis on exports and expects to notch exports in excess of Rs 20 crore in the current year (ending this June). The GP/GC sheets industry is presently characterised by excess capacity as the actual annual demand is hovering around five lakh tonnes while the installed capacity is around nine lakh tonnes. The company has managed to increase its capacity utilisation from 52.8 per cent for CR sheets in 1991-92 to 60.5 per cent (annualised) in 1992-93 while that of GP/GC sheets has increased from 78.6 per cent last year to 96 per cent (annualised) in 1992-93.

For the first six months of the year ending June 1994 the company has posted a higher net profit of Rs 1.6 crore on net sales of Rs 126.5 crore.

GAMMON INDIA

R and D Efforts

Gammon India fared well in 1992-93 with a 10 per cent rise in total income and a 15 per cent rise in operating profit. Despite a 36 per cent rise in interest charges, net profit increased by 33 per cent due to a mere 2.5 per cent rise in depreciation and a fall in tax provision over the previous year. During the year the company hived off its Gammon Fer-chem division as the factory had ceased operations since November 1987. The contract of a 900-bed hotel in Moscow valued at Rs 120 crore was foreclosed due to the fragmentation of the erstwhile USSR and the abrogation of the Soviet-Indian Business Treaty. However, the contractee had invoked the advance payment guarantee amounting to Rs 18 crore which the company claims is not tenable as it has performed its obligations under the agreement and the claim, in any event, cannot exceed the amount of unexpired guarantees of Rs 1.2 crore. The company had a balance of work-on-hand worth Rs 331.5 crore as compared to Rs 430.6 crore last year while Rs 118 crore worth of contracts were under negotiation on March 31, 1993. Further, the company has since secured contracts worth Rs 34.9 crore and it expects its prospects to be bright due to the massive construction activity envisaged at the national level.

The company's R and D division is engaged in developing and improving construction techniques to suit Indian conditions by design improvement, use of indigenous chemicals and resins, import substitution of vital components of construction equipment, in-house manufacture of equipment and more efficient launching systems for bridges. It is also focusing on improving quality control and updating technology in various fields of construction engineering to support the requirement of the construction activities of the company.

Among its subsidiaries, while Freyssinet Prestressed Concrete Company (97.83 per cent holding) and Gammon Nirman (99.96 per cent holding) posted satisfactory results, the other two subsidiary companies, namely, Gammon Turnkeys and Gilcon Project Services registered net losses for 1992-93.

For the first half of 1993-94, while the company's total income rose to Rs 34.7 crore, net profit was stable at Rs 22 lakh as again... 1 total income of Rs 34 crore and a net profit of Rs 21 lakh in the corresponding period last year.

FLEX INDUSTRIES

Bright Prospects

Flex Industries which is engaged in the manufacture of flexible packaging has improved its performance over the previous year. The annualised increase in net sales and net profit over the previous year (15-month period ended June 1992) works out to 50.6 per cent and 48.5 per cent, respectively. Production was also higher at 4,721 mt as against 4,185 mt of printed, laminated, metalised, co-extruded coated, embossed plastic film and paper produced last year. The company's 'unit pack' marketing concept seems to have proved to be the right strategy as buyers prefer to buy consumer goods in small, convenient and apparently cheap units which are consumed in their entirety during use. Increasing resort to short-term loans (up 320 per cent over the previous period) by the company led to a 17 per cent rise in interest charges. Though operating profit rose by a mere 2.8 per cent due to a more than proportionate increase in operating expenses, a stable depreciation charge and a lower tax provision led to a larger increase in net profit. Encouraged by its improved performance the company raised the dividend rate from 36 per cent last year to 40 per cent in 1992-93.

During the year under review the company completed installation of new machines. Further, the company's new expansion project at Malanpur in Gwalior for the manufacture of flexible packaging material and the modernisation programme at its existing plant at Noida were completed and commercial production commenced. The company's expansion-cum-modernisation programme led to a gross fixed assets formation of 67.5 per cent during the year. To part finance its expansion-cum-modernisation programme the company made a rights issue of 38,13,750 17.5 per cent partly convertible debentures (PCDs) of Rs 100 each aggregating Rs 38.1 crore and 9,15,000 18.5 per cent non-convertible debentures (NCDs) of Rs 100 each with one detachable warrant aggregating Rs 9.2 crore. For augmenting its resources for margin on working capital and long-term working capital requirements the company also made an issue of 1,50,000 secured redeemable convertible debentures of Rs 100 each aggregating Rs 1.5 crore by way of private placement with UTI.

With the flood of multinationals entering the country to sell consumer goods, chocolates and all kinds of edible and inedible items, the medium to long-term prospects of the packaging industry appear bright. With a 20 per cent annual growth rate in the industry the company's CMD, Ashok Chaturvedi, expects sales to grow by 50 to 60 per cent annually over the next 10 years.

The Detentions of Lone and Geelani

G Noorani

he ploy of re-detention, employed in the case of Abdul Ghani Lone and yed Ali Shah Geelani, the veteran leaders of Kashmir, makes a mockery f the few safeguards Article 22 of the Constitution provides to detainees nder preventive detention laws.

HE government of India has behaved in a isgraceful manner in regard to the imprison-ıent without trial, called preventive deten-on, of the veteran leaders of Kashmir, Abdul ihani Lone and Syed Ali Shah Geelani. The rders were made by the state government, in ross disregard of the state's Constitution ıd the Constitution of India, but the state is ıder president's rule. They are both leading ghts of the Hurriyat Conference.

The two enjoy high respect. They were etained on October 29, 1993 by the state overnment on the ground that they were ıaking statements urging people to join a arch to the Hazratbal shrine to force the my to lift the siege of the shrine. The matter as settled the next month when the siege as lifted as a result of an agreement with the ilitants holed up inside. It is another matter at the government chose to deny the fact. one was subjected to indignity and injuries a result of the brutal assault perpetrated on m by the police when he led a procession. either leader is in good health. Their ontinued detention was not preventive but ınitive and clearly smacked of vendetta.

On January 28, 1994 the Jammu and ashmir High Court struck down the deten-on order. But the state government claimed had made fresh orders the day before, ı January 27, 1994. These orders were ıallenged in habeas corpus petitions in the ıpreme Court. As to what happened in the ıpreme Court thereafter a news-report by e PTI in *The Hindu* of April 29 reveals a lot out the proceedings on the previous day:

> The Supreme Court today warned the centre that it would be forced to release detained Kashmiri leaders Abdul Ghani Lone and Sayed Ali Shah Geelani arrested in October last in the wake of the Hazratbal crisis, if it failed to produce the original records of the detention by May 3.
>
> The warning was given by a Division Bench comprising Mr Justice S Mohan and Mr Justice M K Mukherjee hearing an appeal by the two detained leaders after the Solicitor General, Mr K T S Tulsi, informed the court that the government had not been able to get the records as yet.
>
> Mr Tulsi sought three days' time saying a special messenger had left with the records from Jammu but he was yet to reach Delhi.
>
> Mr Bhim Singh appearing for the detained leaders told the court that the government appeared to be taking the court for a ride and was playing hide and seek with it on the issue.
>
> The apex court had during the last hearing sought from the union government the original records of the detention to satisfy itself that the leaders had been served with the detention orders passed on October 29 and a subsequent detention order in January after revocation of the earlier order.
>
> The counsel for the two leaders had told the court that the grounds for detention had not been informed to the two leaders thus denying them an opportunity to represent against the detention.

The PTI's report of the proceedings on May 3 were published the next day in the same paper. They read thus:

> The union government today told the Supreme Court that the release of Kashmir leaders, Abdul Ghani Lone and Sayed Ali Shah Geelani, could have far-reaching consequences leading to the freeing of over 700 detenus in the state of Jammu and Kashmir.
>
> The plea was made by the Solicitor General, Mr K T S Tulsi, during the hearing of petitions challenging the detention of the two leaders.
>
> A division Bench comprising Mr Justice S Mohan and Mr Justice M K Mukherjee while agreeing with the Solicitor General's plea, however, made it clear that Article 22(4) of the Constitution and judgments of the apex court were a clear bar against holding the leaders in detention any longer. "Mr Solicitor, we have to give effect to the Constitution. You cannot expect us to say that we should do away with the judgments of the apex court", Mr Justice Mohan observed.
>
> However, while agreeing with Solicitor General's plea that the case had far-reaching consequences, the court adjourned hearing till tomorrow to enable the Union of India to present further arguments in support of the continued detention of the two leaders...
>
> Counsel for the detained leaders, Mr Bhim Singh, submitted that the second order of detention was null and void as it had been passed by the Divisional Commissioner and not the government.
>
> Therefore, if one were to take the period of detention from October 29, after a three-month period as the Advisory Board had approved the one-year detention only to March.
>
> The judge said prima facie the case went in support of the two detenus unless the government could substantiate the need for holding them offer a further period.

Thus was an indulgence given to the state. What happened on May 6? Tulsi told the court that the order of detention of January 27 had been revoked. The court thereupon dismissed the petitions as infructuous. It was widely believed by those who attended the hearings, including members of the bar, that the court was inclined to allow the petitions and order the release of the detainees. Indeed, judgment was expected to be delivered on May 6. It may be recalled that in the case of Kuldip Nayar during the emergency the detention order was revoked in order to prevent the Delhi High Court from delivering judgment on the habeas corpus petition filed by the detainee's wife, Bharati Nayar. The facts are mentioned in *Experiment with Untruth* by Michael Henderson (1977) at page 122. The *Los Angeles Times* of September 1976 also reported the ploy: "When it appeared likely the ruling would be in Nayar's favour, government officials suddenly released him, hoping to avoid an announcement of a decision which could be used as a precedent by other detainees hoping to be released." But Justice S Rangarajan ticked off the government lawyers and proceeded to deliver an erudite judgment which was a major event—a landmark ruling in support of the citizen's rights and the rule of law. It was a masterly exposition of the law.

In the instant case, the detainees were released and rearrested after fresh orders of detention were served under Section 9(5) of the Jammu and Kashmir Public Security Act, 1978. If this ploy of re-detention is allowed to succeed, it will make a mockery of the few safeguards sub-clause (4) of Article 22 of the Constitution of India provides to detainees. One hears a lot about judicial creativity. It has not halted the illiberal trend in rulings on preventive detention.

On a fresh order of detention after the quashing or revocation of the first the law as laid down by the Supreme Court is that it must be based on "*fresh* material (Chhagan Bhagwan Kahar vs N L Kalna A I R 1989 S C 1234). Consideration of grounds in the previous order will vitiate detention (Jahangirkhan vs Police Commissioner A I R 1989 S C 1812). At page 1882 is reported Ramesh vs State of Gujarat which affirms Chhagan's case.

This safeguard is not adequate. Two more are called for. One is that the court must subject the second order to greater scrutiny. The other is that no second order must be permitted to pass muster if made after a judicial hearing of the first. It is palpably mala fide and should be deemed to be so.

DOCUMENTATION ASSISTANT

A Bombay based news agency requires part time person to organise newspaper clippings.

Timings are adjustable and would be for three mornings or afternoons a week. Position is suitable for graduate or undergraduate student with a broad interest in current affairs. Applicant must live or study in south Bombay.

Contact: The Editor, Associated News Features, 116 Great Western Buildings, Nagindas Master Road (Extn), Kala Ghoda, Bombay or phone 2043101.

RURAL DEVELOPMENT ORGANISATION seeks the following experienced personnel for its projects in Chotanagpur region in Bihar/ Tamil Nadu

* REGIONAL PROGRAM EXECUTIVE with minimum 5 years experience in Project Planning and Fund Raising.
* TECHNICAL PERSONNEL for Sericulture Promotion in Singhbhum and Palamau Region.
* RESEARCH PERSONNEL.
* TECHNICAL PERSONNEL for Promotion of Agricultural Extension, Dryland Farming, Horticulture and oilseed Cultivation.
* WOMEN CO-ORDINATOR with Special Reference to Adult and Non-formal Education Programmes.
* PROJECT MANAGER to be based in Dharmapurai, Tamil Nadu.

All Applications should reach on or before 25.06.94 to:

Alternative for India Development,
1 V.G.N. Nagar,
Iyyapanthangai Kattupakkam Post,
Madras 600 056.

SOCIETY FOR PARTICIPATORY RESEARCH IN ASIA (PRIA)

INVITES DEVELOPMENT PROFESSIONALS

PRIA is an educational support Non Government Organization (NGO) involved in Research, Training and production of learning materials. Its Development Professionals, based in Delhi, run programmes of its Centres as researchers, trainers, communicators and networkers involving frequent travel.

1. Centre for Participation and Governance supports Participation of and Self Governance by marginalized sections in areas of literacy and natural resource. It also focusses on micro-planning and local development under the Panchayati Raj and Nagarpalika, 73rd and 74th constitutional ammendments.

2. Centre for Occupational and Environmental Health focusses on healthier work and living place. It promotes awareness /action on occupational health and environmental pollution. As a CIS Collaborating Centre of ILO, it generates, processes and disseminates information internationally.

3. Centre for Institutional Development enables capacity building of grass-roots groups and NGOs in such areas as programme planning, monitoring and evaluation, training methodology, organizational development, strategic planning, and finance. It is starting a long duration programme on Development Management for South Asian NGO leaders.

4. Centre for Global Alliance actively participates in and promotes development of international networks and alliances for solidarity and advocacy on critical global and local issues/concerns. It promotes cross-country and inter-regional exchange towards capacity building, development cooperation and learning.

Qualifying Background : Relevant Post-Graduate education, with at least 8 years experience.

Compensation Package: Rs. 100,000 p.a. or more, depending on ones expected contribution to PRIA's work..

Please write in confidence within three weeks, to:

Dr. Rajesh Tandon
Executive Director
Society for Participatory Research in Asia
42, Tuglakabad Institutional Area
New Delhi - 110 062

A Negotiated Revolution?

Ninan Koshy

The ANC leadership is conscious not only of the uniqueness of the system against which it waged struggle, but also of the fact that those who upheld the system now share power in the new government. Not only negotiations, but the revolution also has to continue.

"THE way the election was conducted—all its imperfections notwithstanding—is proof that this country has just survived a negotiated revolution", so wrote a leading daily in South Africa after the first all-race elections in the country. To Nelson Mandela the election was liberation and to justice Kriegler, the chief of the independent election commission it was an act of national reconciliation.

That the election was unique goes without saying. That was best evident in the faces of the millions who waited patiently for hours and sometimes for days to cast the first vote in their life affirming their dignity as well as citizenship. To them the vote was something really precious.

Negotiated revolution has become the favourite media expression to describe the transformation in South Africa. Add to this, the claim by the last National Party state president F W de Klerk that it was he who ended apartheid and the interpretation of the final stages of the historic change in South Africa becomes either simplistic or distorted. The claim by the National Party that it voluntarily relinquished power is invalid but credit goes to de Klerk for almost correctly reading the writing on the wall. The apartheid system was something unique in the annals of history and its end also had to be in a unique manner.

From the time the first Dutch settlers established a trade base in Cape Town in 1652, South Africa's destiny was inextricably linked to successive Dutch or British colonial rule. From this date South Africa was decisively influenced by the economic and political aspirations of western European society and of the European settler community established at the southern tip of Africa. This not only shaped the contours of South African society but to a large extent was responsible for the main and overriding conflict in South Africa, namely, the conflict between the African majority and a settler community which dominated militarily and politically and whose own economic interests were the decisive factors in the formulation of policy.

The distinctive characteristic of colonialism in South Africa has been white minority social domination. This form of domination was intimately tied to the economic and political systems of the metropole countries from which the domination emanated. The main conflict in South Africa could thus be characterised as a north-south conflict. The cumulative result of the political and economic domination of the white minority was a society characterised by enormous socio-economic disparities coinciding with political power and race boundaries. Two worlds still exist in South Africa—on the one hand a first world with a sophisticated infrastructure and capital-intensive economy; on the other hand a third world with all its problems. While the first world is almost exclusively for the white minority, the majority of the blacks belong to the third.

The pattern that settler colonialism created in South Africa based on racial discrimination in the combined interests of western capital and the settlers is what made the South African system unique. But that uniqueness made it impossible that the domination could be ended either by colonial withdrawal (as in most African countries) or externally controlled transition (as in Zimbabwe and Namibia). Hence there had to be a unique way of ending the conflict. It was the paradox of the South African situation that whereas it was saddled with the colonial problem of white domination it did not have the option of colonial withdrawal or transition to solve it.

The beginning of negotiations in South Africa is often traced to the dramatic announcement by president de Klerk on February 2, 1990 in which he said the government was ready for negotiations, that the political parties would be unbanned and that political prisoners would be freed. Nelson Mandela became a free man nine days later.

The apartheid regime had already begun to crumble by the mid-1980s. For two decades the major arena for the battle for the future of South Africa was international public opinion. The liberation movement had decisively won the battle there by 1985. The configuration of domestic, regional and international developments made it inevitable that apartheid had to yield to something different. The regime reacted in two different ways. In public in a defiant mood it appeared to withdraw into a permanent siege. In secret it initiated talks with Nelson Mandela in prison. It took five years for the second track to become public.

There is little doubt that what de Klerk had in mind in 1990 was not exactly the kind of transition that actually took place. He had thought that the ANC could be co-opted into a political system where the white minority could still be able to pull several strings and control the levers of powers. The negotiating positions of the National Party, emphasising federalism and demanding what was tantamount to a minority veto were all meant to preserve in the new dispensation, to the extent possible, special privileges for the minority.

Shared power was the watershed concession by the ANC, but the National Party had to give up its earlier crude strategies to create an anti-ANC alliance, to insist on white vetoes in the cabinet or to rotate the state presidency and so on. It should not be forgotten that de Klerk had to discard the principle on which he vowed he would stand rock solid, never to accept black majority rule.

Joe Slovo, the leader of the South African Communist Party whose 'sunset clauses' formed the basis of ANC's proposals for power-sharing claimed, "Looking at the result as a whole, I can say without hesitation that we got pretty much what we wanted. Our opponents hoped to weaken a future democratic state by imposing federalism. We have won a united South Africa ... in all critical areas ... the future democratic state will have overriding powers. If you look at the finance provisions of the whole dispensation you will see that the purse-strings are firmly in the hands of the central government... In regard to decision-making in the future executive, in the multi-party Cabinet of national unity ... the regime had been holding out for special majorities. In the end we won the principle of majority decision-making." Slovo conceded that all this amounted to no more than 'a mountain of paper' unless it is implemented 'in the interests of revolution'.

The African National Congress had hoped to get a two-thirds majority in the National Assembly and the Constituent Assembly. There are many who believe that it was good in the interests of national reconciliation that the ANC did not achieve it. The ANC is now in a position to implement its policies but in drafting the constitution it needs the support of other parties especially, the National Party. A two-thirds majority might have generated anxiety in some sections and might have been used by those forces which want to undermine the process of national reconciliation. It has to be pointed out that the constitutional principles have already been agreed upon and included in the interim constitution which stipulates that 'a new constitutional text shall comply' with them.

These principles which reflect ANC's positions are non-negotiable. The most disappointing performance in the elections was by the Pan Africanist Congress (PAC) and the Democratic Party. The PAC was formed in 1959, breaking away from the ANC basically on two issues, the prominence of whites in the struggle and the issue of land. These two issues have remained the dominant feature of its policies. Like the ANC it was also banned and went into exile and made a few shifts around the central issues of its identity.

While the PAC managed to be in the limelight by its radical rhetoric, on the level of conventional indicators of relative strength of a political movement, i e, funds, organisation, international and domestic prominence, demonstrable mass support, organisational strength, etc, it was always much weaker than the ANC. It had nevertheless claimed extensive underground support. With little funds and virtually no campaign, the PAC could manage to get only 1.2 per cent of the votes and five seats in the National Assembly.

After the elections Mandela paid tributes to the PAC and the Azanian People's Organisation (AZAPO) saying that both had contributed significantly to the struggle of black people against white domination and oppression. "It hurts, hurts me, a great deal that they should not have been able to make the threshold that other parties have made", he said, offering the leaders of the two organisations places in the new government.

The Democratic Party can legitimately claim the heritage of the white liberal stream in South African politics. But as it went through many shifts in the recent past the ground on which it had stood was taken by the National Party which claimed to be 'new' after having 'ended apartheid'. At the time of the DP's virtual demise it must be recalled that its predecessors played an important role in exposing apartheid from the perspective of human rights and its leader Zach de Beer made vital contribution especially in the early stages of negotiations.

Considering the fact that chief Buthelezi's Inkatha Freedom Party came into the election fray virtually at the last minute—making the election arrangements which were from the beginning less-than-satisfactory even more difficult—the 10.5 per cent vote it got at the national level was impressive. Pre-election polls had not given the IFP more than 7 per cent votes. It had earlier stayed out of elections claiming it was committed to federalism and therefore could not accept the constitution and strongly opposed to what it termed the ANC-NP alliance.

It should be recalled that for a long time chief Buthelezi was the favourite of many western leaders projecting him as the moderate alternative as he challenged armed struggle and international isolation. For some time the National Party considered him as an ally but as negotiations progressed Buthelezi moved on to an alliance with the extremist whites. His movement was supported and used by the 'Third Force' in the South African security forces to foment violence as conclusively proved by the Goldstone Commission.

It is known that it was an accumulation of irresistible pressures including possible withdrawal of support by the Zulu King and Inkatha moderates that finally pushed Buthelezi into the elections. He had hoped that the international mediation on some constitutional issues to which the ANC and the government had agreed would pave the way for postponement of the election. But when the mediators Henry Kissinger and Lord Carrington refused to include the date of elections in the terms of reference for mediation, Buthelezi had run out of all options.

Meanwhile Nelson Mandela had skilfully been able to convince the Zulu king that the best he could hope for was the constitutional position offered by the ANC. Mandela graciously affirmed his and the ANC's support for the king at an ANC rally in the heart of the Zulu kingdom.

But the pressures came not only from the king. Increasingly unhappy with the prospect of becoming members of an extra-parliamentary guerilla group Inkatha moderates read Buthelezi the riot act saying they would quit rather than support an organisation bent on boycott of elections with a resultant escalation of violence. They were not ready for political wilderness when they felt that power was so close at hand at least in Natal. That was not all. It is now known that there was a secret deal between de Klerk and Buthelezi. On 25th April—the day before voting began—de Klerk signed an agreement that put 7.41 million acres of land into a trust controlled by the Zulu king.

Yet, the inclusion of Buthelezi in the new dispensation and his being given an important portfolio in the cabinet augur well for national reconciliation. This is in no way to underestimate the problems in Natal. It is often not made clear that political violence among blacks in South Africa is not primarily tribal as the media especially outside South Africa has managed to project it. While almost all supporters of Inkatha are Zulus, all Zulus are not supporters of Inkatha. Even in Natal the Inkatha managed to get only 51 per cent in an election believed to have been rigged. Political violence among blacks in which many Zulus were killed was often between Zulu supporters of Inkatha and Zulu supporters of ANC. What was called black-on-black violence was basically political and its escalation was often due to the involvement of the security forces.

It is not clear at the moment what the post-election strategy of Buthelezi will be. While bargaining for regional powers and provincial autonomy, he will project himself as a national leader as the country enters a new stage of black politics.

One political party which stayed out of the elections was the white Conservative Party. A section of the whites under the name Freedom Front contested the elections and won 2.2 per cent votes and nine seats in the National Assembly. Its participation was on the basis of an agreement with the ANC and the outgoing government on a formula for negotiations for the self-determination of the Afrikaners. The accord, the finalisation of which was reportedly assisted by Britain, Switzerland and Belgium makes provisions for: any community sharing a common cultural and language heritage whether in a territorial entity or any other recognised way to demand the right to self-determination; the final constitution to give expression to any particular form of self-determination provided there is proven support from within the community; the formation of a 20-member 'Volkstaat' Council to be elected by members of the National Assembly supporting the establishment of a 'Volkstaat'.

The Freedom Front's bargaining position has considerably weakened as it got only less than half of the votes it had hoped for and which itself had indicated as the basis for successful negotiations. The definition of self-determination is crucial not only with regard to the claims of the whites who cannot show any contiguous territory with white majority but in dealing with issues of autonomy which are bound to be raised in the making of the new constitution.

As it confronts manifold challenges, the ANC leadership is conscious not only of the uniqueness of the system against which its struggle was waged but also of the fact that those who upheld the system now share power in the new government. While the politics of apartheid has come to an end, its economics still continues. Therefore, not only the negotiations but the revolution also has to continue.

Child Marriage, Government and NGOs

Shanker Singh
Nikhil Dey
Aruna Roy

The focus on the child marriage ceremonies which take place during 'akha teej' in Rajasthan has an upper caste and class bias and is a misinterpretation of a dalit and OBC custom. In the name of being modern, it is another chance to oppress dalits and OBCs, while shifting the focus from dowry deaths, the tortured existence of widows, etc, among the upper castes.

BHANWRI, a kumhar (OBC) of village Bhateri in Jaipur district was gang raped by a group of five men, four of whom were gujjars (OBC) of the same village, on September 22, 1992. The gujjars form a majority in the village. She was made a target because she had, at the behest of the Women's Development Programme (WDP) a government programme she worked for, and the district administration of Jaipur, tried to stop a child marriage from taking place in her village. With little progress in the investigation and prosecution of the culprits, social activists, women's groups and other supporters held a rally and meeting in Jaipur in November 1992. The meeting ended with the courting of arrest and breaking of the cordon, near the state secretariat. As a result of that protest, the case was handed from the state CID to the CBI. After a year of investigation, the CBI charge-sheeted the culprits, and they were finally arrested in December 1993.

Bhanwri's case has drawn wide support from people and groups from all walks of life. Gang rape is a non-bailable offence. So, the initial bail application was rejected. But a second application filed on April 11, 1994 fetched bail for three of the five accused of rape. The whole struggle is now concentrated on a legal battle for justice.

But is this the end of the social relevance of that rape? One must examine the socio-political factors leading to the rape, and the subsequent reactions. Bhanwri's case is unique because she is a government servant who was raped as a consequence of carrying out directives of government campaign.

Every year at 'akha teej' (the marriage season which falls in May) the state government of Rajasthan launches a drive against child marriage. One of the agencies relied upon to combat child marriage is the WDP. The work burden falls upon the lowest level functionary—the 'sathin' who is required to report on child marriages taking place so that the police can intervene. This is where Bhanwri who is also a sathin was caught on the cleft end of a stick. Bhanwri was in a predicament. But a whole lot of others are involved in processes which create such predicaments advertently or inadvertently.

What were the influences playing on Bhanwri when she got involved in this case? She had been recruited into a new government programme which not only worked for radical goals, but was to use non-bureaucratic and radical processes. She was put through an intensive training co-ordinated by activists like us where the emphasis was on fearless opposition to social evils. She had learnt the jargon of change and participated in various follow up programmes like 'jajams' and 'shivirs' where radical goals and processes were re-emphasised.

Her alienation from the village had begun when she received the Rs 200 stipend from the government. She was told by others in the village that after all the government was paying her to do a job. The *de facto* targets like family planning, and prevention of child marriage had begun to creep in. Despite her confusion on these issues, she knew where her honorarium was coming from. Therefore, it is not surprising that she 'bravely' reported on and opposed a child marriage in her village, although the act made her alienation complete. It was an unfortunate fall out of being involved in a government programme. That she was brave in facing the wrath of the village was part of the training she had imbibed. That the form the reaction would take would be abhorrent, criminal and violent beyond her imagination, was something she was soon to learn. After the crime she retained her courage, looked for support, and decided to take on the world.

People within the WDP did react promptly. Once again it was part of their training. Many of them had been handpicked for their commitment. After all Bhanwri was one of their own. What happened to her, happened to them. A co-ordinated reaction began to emerge as those within the WDP realised that fighting from within was leading nowhere, and concerted public pressure was necessary. The press, lawyers, academicians, political party members and activists joined the vociferous cry that culminated in a huge rally in Jaipur demanding the arrest and prosecution of the guilty. The state government lackadaisically, ordered a CBI inquiry two months after the event, and continued with its task of promoting social change.

Bhanwri still lives in her village threatened and ostracised. After sustained pressure the government has provided her 'security and compensation'. But has the government examined its own role in fighting social evils? What sathins and other government functionaries will have to ask themselves is whether they expect the government to stand by them, when there is a reaction from powerful groups to another government campaign.

The eventual arrest of the five culprits has shown once again that public pressure forces a system even as unsympathetic as ours to respond. But an analysis of the subsequent events has shown that the response has been largely judicial. The government has engaged in no introspection, about its approach to the issue of child marriage. Nor has it reviewed the role of sathins and 'prachetas' in 'reporting' to an official machinery on sensitive social issues. It has certainly not taken the responsibility of dealing with the fall out of its programmes and actions. As akha teej approached this year, once again the district administrations have been asked to prevent child marriages. And once again the prachetas and sathins are being encouraged to be the agents of change by persuading families not to have child marriages.

It is not quite right however to merely blame the government. The government has only succeeded in presenting a progressive facade because of the involvement of NGOs and individuals with credibility. When it becomes clear that such involvement is born out of mutual benefit where funds and the space provided by working with the government are major considerations; then the responsibility for the hypocrisy such programmes generate must be shared by all those who involve themselves in it.

At the end of the rally in Jaipur, the attitude of the government was very clear. Bhanwri's suffering was merely an unfortunate fall out of a programme that was beginning to be run for prestige and for sustaining an image. That was the time for sathins, prachetas and other 'committed' staff to leave in large numbers, and for NGOs to completely dissociate themselves from the programme. It was necessary to discredit the government programme, cripple its image building aspect and show that the commitment was not to the comforts of a government programme; but to a cause.

Issue of Child Marriage

The isolation of child marriage as one of the greatest social evils has to be critically viewed. Especially as the statement comes from class and caste groups who practice, and are victims of, the far more destructive, social custom of dowry. What follows is an attempt to analyse the issue of child marriage. To look at the manner in which the government has tried to stop it and Bhanwri's predicament of being a pawn in a game of cosmetic social change. A process in which many of us play a part.

'Child marriage' in Rajasthan is far from a marriage as it is normally understood. The film crews, journalists and photographers of

glossy magazines who descend on Rajasthan every akha teej bring out the colours of Rajasthan and the misery children experience at being forced to dress up and suffer hours of a bewildering ceremony. What they do not reveal is that the children return to their respective homes until the 'muklava', 'ana' or 'gohna' ceremony, which takes place years later when the girl goes to her in-laws' home. The so-called marriage ceremony should actually to understood as an engagement. The effort should therefore be to delay the muklava till the girl is 18 which is the legal age of consent. There is sufficient internal pressure within rural communities to support any effort to delay the ceremony of muklava.

The internal logic of child marriage ceremonies is fairly sound. Child weddings take place primarily amongst OBCs and dalits, and therefore most often poorer families. Instead of having to spend on the wedding of all the daughters repeatedly, when the oldest daughter in the family gets 'married', all the younger ones are 'married' too. The economic logic of group weddings needs no explanation. Even this group ceremony is often expensive enough to account for years of indebtedness.

These girls do not suffer the social miseries of widowhood that affect the upper castes. In the event of the spouse dying, widow remarriage is sanctioned and practised freely. Since women work outside the home, the girl is an economic asset, and therefore her family tries to keep her with them for as long as possible. It is also the reason for there being no dowry. What exists is the practice of paying a bride price, and as with any such monetary transaction it serves to highlight the value of the man. Where dowry is practised the woman has to pay more for the 'honour' of marrying a man of value. In this case the more 'valuable' the man, the smaller the price the family has to pay for buying the bride. Whether dowry or bride-price it is the woman who is bought or purchased. However it is undoubtedly true that in upper caste groups who practice dowry, the woman is seen far more as a commodity of disvalue. There are a number of legitimate objections to child marriage customs. But it is only if we compare it with other prevalent marriage customs in our society that we will get a fuller picture of what is a very complex social issue.

While criticising child marriages, no mention is made of the very sensible spending patterns, and great community participation that are a part of these weddings. This is in stark contrast to the conspicuous and abhorrent expenditure that the urban dowry giving elite is establishing as the norm. The analysis and description of child marriages is part of an attempt at sanskritisation. The elite amongst the OBCs and dalits who have begun to get their children married when they are older, have also adopted the practice of dowry and extravagant weddings.

Why should we compare these customs? Because the focus on child marriage ceremonies has an upper class and upper caste bias and is a misrepresentation of a dalit and OBC custom. In the name of being modern it is another chance to oppress dalits and OBCs, while shifting focus from customs like dowry-deaths, physical isolation of women, and the tortured existence of a widow in upper caste families.

It also reveals why the government has so eagerly prioritised this issue in its bid to bring about a 'social transformation'. The law has been made more stringent. There has been a writ filed recently in the Rajasthan High Court to give the law more teeth and the implementers more powers. More seminars, meetings and drives are held to root it out, and there is a selective use of it as an instrument of control. Child weddings cannot be stopped—but specific individuals can be persecuted, and very often money can be extracted. The upper class policy-makers successfully shift the focus, and the implementers acquire a new weapon.

The district administration which prevents the largest number of child marriages is given credit and the press highlights stories of 'successful' attempts to stop them. This appreciation is shown despite the fact that in most cases the officers mobilising their agencies to stop child marriages have taken and given large dowries. And of course no child marriage ceremony is actually stopped—it simply takes place in great secrecy, perhaps with the added cost of paying off the authorities.

Bhanwri was raped by Badri, Gyarsa, and three others; but are not many more responsible? Is not the government also responsible for forcing targets on her on an issue which gives it an apparently socially progressive image. Are not the committed functionaries responsible for continually compromising in the attempt to find space within? Are social activists not responsible for suspending their critical faculties and participating in the contradictory business of government- sponsored social change? And finally, even Bhanwri and other sathins will have to introspect and ask themselves whether they want to continue to be used as pawns in the hope of getting a permanent government job. How vested is their interest?

Now that the culprits are finally behind bars it is time we asked ourselves these basic questions. Vast sums of money are coming in from the west for lip-service development and cosmetic social change. If we continue to provide credibility there will not only be more casualties like Bhanwri but the process of genuine change will be discredited. Unfortunately it seems as if the trend continues. The recent increased involvement of voluntary organisations in the WDP, and the unionisation and wage demands of the sathins are two different examples of continued acquiescence.

The whole WDP decided its course when it spoke for continuation and an attempt to fight from 'within the system'. The threat of mass resignation on the day after the rally was openly stated to be merely a threat. Clearly the vested interest of being in a government job weighed heavily on the minds of those who were in it. They viewed the issue of rape as a very serious one. Yet there were limits to the degree of open confrontation with the authorities. Obviously the next step was conventional unionisation so that protection could be provided from within the system.

And while the demand by the sathins to be made full time government servants with commensurate pay scales is in one sense ...itimate; clearly it is a larger step towards ... their own freedom of action. One is forced to ask the question—what is more important, the cause they are working for, or themselves? Or are they both synonymous? It is ironical that a programme that began with the objective of empowering women, and poor women in particular should get focused on issues of salaries and tenure for the 'volunteers' themselves.

The enrolment of more active NGOs to run district IDARAs of the WDP is another successful step in the process of co-option of the language and inspiration of change by the state machinery. By the nature of their existence, NGOs have drawn great strength ...om being outside the structure of the gov...nment. It has given them flexibility, and ...ability to deal with social issues with courage and sensitivity. Their criticism of the government and its programmes has very often had a salutary effect on the programme. Recently however, the government has found it convenient and effective to use the NGO structure also. The irony of this contradictory hybrid is best revealed by government organised non governmental organisations (GONGOs) like IDARA.

With the government managing to rope in prominent NGOs to run GONGOs like the district IDARAs this process of co-option is even more visible. For an administration that increasingly responds only to pressure, one ...eed hardly wonder whose influence will be greater in this new form of official relationships. In the process of change, NGOs had carved a niche for themselves, and managed to raise and highlight issues which the political parties and the establishment had chosen to ignore. In doing so it had forced the establishment to give such issues legitimacy. As NGOs take one more step in the direction of being part of the establishment, there is a need for a critical evaluation in order to understand where they will stand when there are conflicting interests. To speak a radical language has always been fashionable. Today, it is also profitable. However, when ...l thought out and half hearted radical efforts are made by people who want to have the cake and eat it too—the process of change has a major setback. People like Bhanwri, on the frontline of such efforts are the ones who will continue to suffer from the fall out.

That there is a great need for socio-political change does not even need to be stated. But the government cannot lead a campaign for change against a system it represents. The government can be pressurised. Its laws can be used. It can be made more accountable. Its internal contradictions can be exposed. Its money can be made available to the public to whom it ...ully belongs. Its more committed functionaries can genuinely help. But it cannot lead a revolution against itself.

Bhanwri's case must teach us that socio-political change must be rooted and come from the people. The issues, and the methods of dealing with them must be formulated by those who have a vested interest in change. We must be aware of precisely who is using whom when we collaborate. And finally, we must not let monetary handouts pull the wool over our eyes.

Girl Child in Three Indian States

Ashim Mukhopadhyay

While education is essential for empowering the girl child, it is even more important to recognise the services she renders. Household surveys in West Bengal, Bihar and eastern Uttar Pradesh reveal that all girl children in rural households are in fact disguised child labourers, with the degree of exploitation varying with socio-economic backwardness.

WE are in the fourth year of the SAARC Decade of Girl Child (1991-2000). The enthusiastic response to the growing concern for the survival and overall development of the girl child in the SAARC region prompted the heads of the concerned governments/states to declare in 1991 the period, exclusively for the girl child. The government of India, in pursuant of this declaration, prepared a National Plan of Action focusing on three major goals: survival, protection and development of girl children in the country, while emphasising the needs of those belonging to special and vulnerable groups and the adolescent ones. In the National Action Plan that was prepared, it was said that "this Plan of Action for the Girl Child will help sustain the consciousness aroused all over the country and achieve the goals set for a brighter future of the girl child in India within this decade."[1]

Here we try to expose the built-in-depression the girl child is still steeped in by highlighting the findings of four very recent studies, two on West Bengal, one each on Bihar and eastern Uttar Pradesh, supported by our micro-surveys. The revelations, certainly, do not go in favour of the much vaunted declaration and the Indian leaders who had been signatories to it.

As for West Bengal, surveys were carried out in slums in Purulia town, and in the Bandoan bloc in Purulia district. Three villages, Pukurkata, Kuilapal and Paharpur in the bloc were chosen for this purpose. The same survey, sponsored by the Institute of Local Government and Urban Studies and the United Nations Childrens Fund (UNICEF), was also carried out in two other villages, Harinathpur and Chuakhola under Falakata Ps in Jalpaiguri.[2] The second set of findings on the state were by the School of Women's Studies, Jadavpur University, and covered four villages of Burdwan and South 24 Parganas districts and a ward (No 79) of the Calcutta Municipal Corporation.[3] The study on Bihar, which includes Hatiakan village in Patna district, Purana Dumka in Dumka district and Punasiya in Deoghar, was conducted by Centre for Womens Development Studies, Bihar. In eastern Uttar Pradesh, the study was by the Centre for Women's Studies and Development, Benares Hindu University, and it covered four villages in Varanasi and Sultanpur districts and two city wards. My own micro surveys are in two gram panchayats in Midnapore district, Sauri-Kotbar and Sabra under Danton Bloc II on the Kharagpur-Contai road.

The surveys by the School of Womens Studies, those on Bihar, eastern Uttar Pradesh and Midnapore are pointers to the wide gap between promises and actions, temporary outburst of emotion and sincerity of purpose, illusion and reality.

As for literacy, wide inter-sex disparities are highlighted by the studies concerned. At Kuilapal, Pukurkata and Paharpur in Purulia district and Harinathpur and Chuakhola in west Dinajpur, north Bengal, the males dominate the scene.

The details are as follows:

Kuilapal-male/64.65 per cent, female/28.75 per cent, Pukurkata-male/32.31 per cent, female/1.85 per cent.

Paharpur-male/60.56 per cent, female/11.76 per cent, Harinathpur-male/71 per cent, female/52 per cent.

Chuakhola-male/63 per cent, female/46 per cent.

The UNICEF survey at the Purulia slums finds 57 per cent of males literate, whereas the females were 40 per cent. The age group of the respondents was 5-15 years. In the higher group, the literacy rate for girls registers a sharp fall of 26 per cent.

The School of Women's Studies, JU survey of 600 households furnishes some interesting details. Says the report: "As far as mothers' perceptions in the matter of the desired levels of education for boys and girls, some contrasts may seem quite interesting. It is seen that 4.5 per cent mothers felt that there was no point in educating girls, while only 0.5 per cent felt the same way about boys. Around 19 per cent mothers said that it was enough to educate girls up to primary level or to just teach them to read and write. Less than 4 per cent mothers felt similarly about boys. Whereas 33 per cent mothers wanted their daughters to study as much as they aspired, around 40 per cent wanted this for their sons."

All the 24 girls in Midnapore who responded to this researcher's surveys are school going and want to continue their

studies and of them four had been voluntary trainees in the literacy campaign None of them seem sure about how long they will be able to continue their education Seventeen girls consider education as a weapon to empower themselves and of them seven prefer service, two want to be teachers and five want to join the medical profession Alarmingly seven other girls seem to be extremely fatalist and cannot think beyond becoming typical house-wives or farm hands Of these 24 girls 17 allege discrimination in terms of educational and nutritional facilities within the households All the four student cum voluntary trainees, already mentioned, even apprehend an abrupt termination of their academic career because of capricious whims of their fathers, who are staunch believers in purdah This takes us back to the School of Women's Studies findings that says "more than 21 per cent parents wanted their daughters to become good housewives Only 6 5 wanted their daughters to be doctors, 6 3 per cent wanted daughters to be school teachers and 6 7 per cent preferred some service but did not specify the matter "

Bihar is very backward as regards the status of women Ridden with traditional age-old feudal values and lacking exposure to the processes of urbanisation, universal education and modernisation, its society is characterised by innumerable restrictions on women and girl children Consequently, the percentage of female literacy is very low and female mortality rate is high Gandhiji once said "When you educate a boy, you educate an individual and when you educate a girl, you educate a family " According to the CFWDS, Bihar, "71 3 per cent respondents have illiterate mothers, 2 3 per cent respondents have literate mothers" Though literacy rate in the state has increased from 19 9 per cent in 1971 to 26 per cent in 1981, that of females is not having a smooth run Male literacy rate in urban areas is 62 6 per cent and 34 4 per cent in rural areas Female literacy rates in the two sectors is far below 39 8 per cent and 10 per cent respectively

The wide difference in female and male literacy rates is reflected in the low enrolment of girls at schools, compared to boys In the Class I-V category, the percentage of girls is 52 5 compared to the boys' 107 5 In the Class VI-VIII category, the enrolment of girls is only 14 7 per cent compared to boys' 45 8 per cent

In fact, people in Bihar think that it will be difficult to get girls married if they are educated Because, parents will have to pay more dowry It is interesting to note that the Muslims at Sabra gram panchayat in Midnapore, who are well linked to their Bihari counterparts in terms of language and culture, zealously propagate the same views Take Abdul Mannan, a retired state government employee He does not want women to go beyond the Madhyamik examination In fact, his first three daughters could not go to any college, but he is determined to make his son, an M Sc and sit for the IAS When asked why he did not prefer higher education for

its daughters, Mannan got visibly annoyed and said: "Do you want them to secure a job and make it an alibi to move about till late into the night and marry a Hindu or a Christian boy? Impossible." (Interview with Mannan, December 24, 1994).

In eastern Uttar Pradesh, 42.2 per cent of the responding girls have never attended any school. Of the scheduled castes and tribes, only one-fourth and one-third respectively, have been able to join schools. Reasons for no attendance/drop-out are 66 per cent economic and 65.2 per cent familial.[5] Interestingly, 88.2 per cent upper caste girls are found to be studying, indicating clearly a lower drop-out among the advanced communities. Parental disinterest in reading and writing as skills to be developed equally by both sexes emerges most sharply among girl children nearly 50 per cent of whom reported that the skill was appropriate for boys only. The UP government's reservation policy in education and employment for scheduled castes and tribes is certainly perceived only for boys.

Coming back to Bihar, we find that 17.3 per cent of the respondents (600) have no specific ideas about their future career indicating the extreme indifference and fatalism they are being drawn into. Again, those who want to continue their studies or pursue a career are mostly urban, upper caste high income groups or financially better offs with mothers highly educated and ambitious which shows that the social background of the respondents does have significant relationship with plannings to further their career.

Only a few girls are really so fortunate. The rest, the vast village-based, socio-economically depressed ones are coldly treated and made to work as hard as draught animals by their parents or male elders. The picture is the same not only in the states concerned, but all over the country. Sometimes, they have to take over the full burden of household chores, so that their mothers may work outside to beef up the family income. They represent child labour in disguise in their own households. This takes us straightway to the question: what is child labour?

Disguised Child Labour

Article 24 of the Indian Constitution dealing with fundamental rights, says: "No child below the age of 14 years shall be employed to work in any factory or mine or be engaged in any hazardous employment." Article 45, that speaks of the directive principle of state policy, declares that the state shall endeavour to provide within a period of 10 years from the commencement of the Constitution, free and compulsory education for all children until they complete the age of 14 years. Again, the Baroda-based Operations Research Ground and Bangalore's Concerned for Working Children define child labour as one in the 5-15 year age group, engaged in remunerative work with or without pay within or outside the family at any hour of the day. If judged by these standards, all girl children in rural households in the country are nothing but disguised child labourers. Patriarchal society throughout the world does not recognise the services rendered free of cost by the girl child and the intensity of this age old exploitation varies according to the socio-economic backwardness of the people concerned as visible more in rural areas or slums in a city.

Of the 24 girls interviewed by this researcher 17 reported back-breaking, tiresome work. They are staying either with their parents or uncles. Take Rekha Patra (10), daughter of the late Hari Patra. She stays in the household of her maternal uncle along with her mother. The man, a farm-hand, has developed a peculiar habit of giving the girl a good beating every day without any provocation before sending her off to the kitchen to cook food. Of course Rekha does not receive any money.

A girl child's work is considered non-productive and non remunerative by the menfolk of her family. Another survey conducted by this researcher at Kultikari, Sabra, Tutranga (Midnapore) and Raspur (Howrah/Amta Bloc I) panchayats shows that on an average a girl child performs 30 to 35 types of tasks throughout the day especially if the school is closed or if she is a drop-out, and her workload increases during the peak seasons. The survey was conducted in December 1993 when the daily wage at Sabra village was Rs 24 + rice and muri (costing Rs 5-6) and a bundle of bidi and a match box. In some other parts of the village the rate was Rs 28 and bidi and a match box. Now, if a small or marginal farmer or a sharecropper has to employ labour to attend to his household chores, this will mean a constant loss of his meagre income. Hence he exploits his daughter or grand-daughter or niece or the daughter-in-law or the young wife, whatever may be the girl's familial status. The patriarchal society, that looks down upon its mother as a second sex, approved of such exploitation and injustice.

Same is the experience of the School of Women's Studies, JU at the four villages under its survey. At Phulmalancha, a remote village under Basanti Ps in South 24 Parganas, the researchers found women doing a lot of useful and productive work. But it were the men who marketed the produce and grabbed the money. The males during talks shrugged off the femalefolks role or remained ignorant of it. The ILGUS survey remarks: "It is a common experience in rural areas that women render very useful service to their male family relations in cultivation and in carrying out different non-agricultural activities. Formally these jobs are taken to have been done by males and wages are received by them."

Denying a woman recognition and remuneration for her work in a household has been a phenomenon quite common all over the world, more so in the underdeveloped countries. According to an FAO estimate, "sometimes women's work could be longer than men's by as much as 43 per cent. Many parts of Africa have a large incidence of female-headed households where women undertake the sole responsibility of growing food. It is in spite of these facts, women have generally been seen as consumers and not as producers in the book-keeping system of development. Such attitudes have resulted in not only adversely affecting the consumer status of women, but have also put development projects in jeopardy. Since women's role is vital they should be included as explicit target groups in rural development, land reforms and technological infusion. This requires a prior understanding of women's work in different geographic and cultural settings."[6]

Education is essential for empowering a girl child, but she also requires a sincere recognition of the services she renders. All the surveys mentioned show that her job opportunities are distinctly narrower than that of men and the wage rates lower and highly exploitative. In the three Purulia villages, inter-sex disparities in employment are as follows. Pukurkata-male/69.23 per cent, female/1.85 per cent, Kuilapal-male/ 77.78 per cent, female/21.25 per cent, Paharpur-male/70.42 per cent, female/11.76 per cent [UNICEF 1989].

Employment assistance provided under IRDP in 1984-85 had 12,106 male beneficiaries against 921 families. In 1988-89, the corresponding figures were 12,590 and 5,406 indicating considerable improvement in women's position even as the latter did not come up to even the half of the male number. Under the Trysem programme that aims at promoting income generating skills, number of male beneficiaries went up from 1,438 in 1984-85 to 1,743 in 1988-89 while the females covered during the same periods were 80 and 93 respectively [UNICEF 1989].

Of the 600 households studied by CFWDS in Bihar, 96.5 per cent girls were found engaged in household work, which is not considered as 'work' either by the definition of work or by parents. Only 3.3 per cent respondents reported on doing some remunerative jobs and "when asked about the plus point of being employed, they said economic independence was the most important factor to motivate them to seek a job."

The situation is worse in eastern UP where in 600 families from four villages and two city wards, only 13 girls reported gainful employment. Majority of the respondents, belonging to the backward classes were indifferent about their future as well as working conditions and seemed to have submitted themselves to their fate.

While upper caste well-off girls (44.6 per cent) had plans to pursue education and career, 67.8 per cent of the class from both urban and rural areas wanted to get married (CWSD 1993). But marriage does not ensure a cakewalk. It just leads to the second phase of bondage in a girl's life, a bondage much longer, more terrible, more unbearable than the years spent at parental home. With

marriage she is just thrown from frying pan into fire Early marriage is still rampant in the three states under discussion Taking the three Purulia villages together more than 65 per cent of the housewives were married off before 16, while the figure for the two Jalpaiguri villages for the same age, happened to 42 per cent In the Bihar villages, as already mentioned, "Out of 64 married girls, 30 were thrown into the cauldron between 13 16 years In eastern UP an overwhelming number of the mothers responding to the survey, happen to be victims of this obnoxious practice Among them, more than half were married before 13 The rest were married between 13-16 years and 16-18 years with preponderance in the first category" (CFWDS) In West Bengal, it can be said that early marriage is prevalent in all the districts varying in intensity During October-November 1989 this researcher while investigating changes in demographic pattern in the districts bordering Bangladesh had been a witness to several such marriages in Nadia, Murshidabad and Malda districts More than 90 per cent of the brides seemed to be in the 12-13 age group and the grooms, hardly above 18

All the respondents this researcher met at Vivekananda Manab Kalyan Samity, an NGO at Sauri (Midnapore) complained of attempts by their fathers to marry them off, putting an abrupt end to their education The girls were below 17 In fact, the existing Child Marriage (Restraint) Act, 1978, that has fixed the minimum age of marriage for boys at 21 and for girls at 18 and made any violation of the provision a cognisable offence, is being shown utter disrespect by the guardians of the two sides The Bihar CFWDS study mentions a survey by H N Singh with 122 persons— 81 males and 41 females, which shows that about two-third of the respondents were married off before 15 About 50 per cent of the females admitted they were married before they had completed the age of 10

Early marriage denies a girl an opportunity for development and increases the risks of immature babies, and infant and maternal mortality, gynaecological complications, repeated pregnancies to make up the loss of male issues As per medical advice, a girl needs four to five years for her physical growth after attaining puberty This is denied when she is married off young and this leads to a vicious cycle The situation is all the more discouraging in the Muslim communities, where restrictions on education, polygamous traditions, false notions of economic well being through having more kids encourage and defend early marriage more enthusiastically than any other religious group At Sabra there are many young housewives who have already given birth to five to eight children At Dhaneswarpur a village under the Sabra panchayat a Muslim gentle man has got 16 children through his two wives Instances such as this are many

Already weakened by discriminations in terms of nutrition and health care in their parental home, a girl child finds her fate sealed off permanently by an untimely marriage Henceforth, she is to act like a beast of burden a baby-producing machine and a tireless lover in bed M A Mannan rightly says that "woman remains the last colony, the last serf, the last minor in many respects "[7]

We conclude with the tragic story of Rumpa Senapati, a 10-year old girl at Dhaneswarpur Her father is a small peasant and also trades in molasses Rumpa s mother, Shibani (32) got her elder daughter, Mithu married at 15 to a retail seller of fish Before marriage, Mithu used to read in Class IX at a local school and assist her mother by attending to many household chores Only a month ago, her husband gave her a good beating following a brawl and she tried to hang herself She was saved but the rope left a deep scar on her throat Mithu narrated the incident to this researcher The irony is that Shibani seems to have learnt nothing from Mithu's misfortune She has now yoked the younger daughter, Rumpa, to the treadmill of the household Listen to the little girl In an interview she says "Except the examination times, I get up early in the morning, sweep floors and if mummy goes out I cleanse utensils and cook food I then serve food to daddy and my two brothers, feed the cattle and look after the poultry Also I give the courtyard a wipe over with water and cow-dung and light lamps at the Tulshi Mancha in the evening My brothers do not work so hard, yet they get good food and better treatment Mummy beats me if she finds any fault but spares my brothers ' Rumpa wants to continue her studies, but is not sure about her future " Mummy says girls should not have any desire but go on working Rumpa also collects fuel, fodder and water for the household everyday The time is not far off when she will become accustomed to such exploitations and regard her status within the family as inferior to her brothers She will grow up and have a family of her own, she too will inculcate the same biases in her daughter's psyche, consequently perpetuating this mode of behaviour in future generations

Redefining the Good Society

A North-South Dialogue on Challenges of 21st Century

Vasant Gowariker
Ignacy Sachs

The complex problems facing humanity demand the evolution of a strategy of sustainable development in which both the north and the south recognise their distinct responsibilities and design synergistic strategies for both groups of countries.

ON the occasion of the 1992 Indian Science Congress a group of distinguished scholars set to explore the interconnectivities and action possibilities related to science, population and development. Their effort culminated in a book,[1] now in its third edition, centred around three broad topics:

—the prospect for the demographic transition in India conditioned by a real social and economic transition;

—a sober assessment of the challenge represented by the need to satisfy on a sustainable basis, sometimes in the second half of the 21st century, the needs of a stationary Indian population of 1.6 to 1.8 billion—the inevitable billion plus, even if there are reasons to believe that the rate of fertility will go sharply down in the next decade or two;

—the contribution expected from scientists capable of blending techne and episteme, the popular know-how and the most advanced science.

The joint effort of the authors unfolds a strategy of sustainable development for India. Why only India, such a strategy has in it the basic ingredients many of which would be just as applicable elsewhere. In a similar vein, but on a much larger scale, was the stimulus provided by the 1992 Earth Summit, held in Rio de Janeiro, to reflect on a planetary scale on ways to promote a smooth transition towards socially equitable, ecologically viable and economically efficient development paths.

For that, it is necessary for the north and for the south to recognise their distinct responsibilities and to design in both groups of countries different yet synergistic strategies,[2] though it is easier said than done.

The whole world must finally grapple with the Gandhian question: How much is enough? The answer to be arrived at would have to be viable in terms of sustainability and eventually applicable universally to be of real practical value. The north just would not be able to continue to be as profligate as at present and must begin making the transition from its present life and consumption styles by shifting to less energy-intensive resource-use patterns. Establishing an equitable trade pattern between the north and the south, transferring of resources from north to south to reverse the present trend of a net outflow of resources from the south to the north, as well as making certain environmentally friendly northern technologies freely available at non-commercial, reasonable prices are three additional important dimensions.

As for the south, it ought to recognise the patently non-viable nature of northern patterns with at least two criteria of sustainable development mentioned above—social equity and environmental viability—even for the north. Through imitation the south may only expect to recreate enclaves of northern style modernity for the benefit of a minority and at the expense of the majority. Hence the need both for the north and the south to steer newer and original development paths, informed by a more egalitarian vision of the society and a different hierarchy of needs—another Gandhian question. Henceforth, further advances in the north and development in the south should rely, as much as possible, on a resourceful use of renewable resources. A biomass-based modern civilisation is not only possible but necessary and, in this respect, tropical countries have a comparative advantage.

India's contributions to the search of a planetary strategy will matter for a variety of reasons:

—almost one in every five citizens of the world will be an Indian;

—the country has a solid ethical and intellectual tradition of looking for an original development path, while maintaining an open dialogue with the rest of the world; at a moment when the south, the north and the east all experience an urgent need to overhaul their failed or exhausted models, India's post-independence refusal to apply ready-made solutions and her bold attempt at pioneering a 'third way' constitutes an important precedent, whatever the judgment on her achievements and failures over the last 40 years;

—India has a large pool of committed and competent scientists willing to engage in a mutually educating dialogue with their counterparts in other countries and more particularly, to confront their views with those of fellow scientists from the north. The Indo-French book project focusing on strategies for the 21st century arose out of these considerations.

The problematique of the book is very broad and, at the same time, bewildering. A Martian technocrat disembarking on our planet, using global statistics would most certainly reach a very optimistic conclusion about the prospect facing the inhabitants of the Earthship.

Thanks to the progress of science and technology already achieved, the age of plenty is within sight. The basic needs of all the humans can be easily satisfied with a reduced burden of work so as to free peoples' time for the cultural, spiritual and ludic activities more congenial with the uniqueness of the human species. Although serious uncertainties remain as to the environmental impacts of some technologies in use and of excessive fuel energy burning, alternative solutions could be worked out by scientists and easily implemented.

Yet, the reality is poles apart from this rosy picture. The world is engulfed by a deep social crisis, compounded by environmental disruption. Its causes are multiple:

—the inequalities built in the working of the economic systems, both within nations and between nations, leading to the twin processes of excessive accumulation of resources in the hands of a minority and of deprivation of the majority; environmental disruption occurs at both ends of the spectrum: the affluent minority with its present life-styles indulges in overconsumption of scarce non-renewable resources, the deprived majority, in order to survive, overtaxes the life-supporting systems to which it has an insufficient access;

—the terribly wasteful and environmentally careless patterns of resource-use: the continuing potlatch represented by the piling up of armaments, the exceedingly high operational and transaction costs of the socio-economic and political systems; the paroxysm of 'creative destructiveness' of the productive capacities prompted by an ill-conceived search for competitiveness, the accelerated obsolescence built-in into equipment and the so-called 'durable' (*sic*) consumer goods;

—the inadequate priorities of technological research biased towards solvable demand and not towards the satisfaction of basic needs;

—above all, the worst form of irreversible loss represented by the wasting of human lives of all those deprived of their right to work, to earn a decent livelihood and to unfold the potentials present in every human being; in modern societies the poor become increasingly useless; alienation and exclusion take the place of exploitation.

Thus, the roots of the social and environmental crisis do not lie in the scarcity of resources Nor, contrary to a widespread fallacy, in the population explosion The non-consumers cannot be blamed for overconsumption of fossil energy and other resources Of course, the demographic transition is desirable, as exponential growth of human population in a finite planet cannot be sustained for ever

But, as pointed out by several contributors to the *Inevitable Billion Plus*, it is not sterilisations or contraceptive technologies that bring down the rate of population growth but basic economic and social transition For the 850 million uneducated and poor Indians the argument that a small family is a happy family does not sound convincing The causal link between population growth and poverty works both ways and to break the vicious circle between the two eradication of poverty and upgrading of social conditions are the first priority

An important feature of the present crisis is that it affects, albeit in different forms and with unequal intensity, all the three groups of countries the late peripheric capitalist countries of the south, the so-called countries in transition from the collapsed real socialism' to market dominated economies in the east and, last but not least, the industrialised countries of the north plagued by structural unemployment brought about by growth without employment and by a diversion of resources from real economy to the great financial casino

By far the most spectacular event has been the sudden collapse of the Soviet Union and the discrediting of the centrally planned command economy, paradoxically at a moment when it could theoretically rely on the technical support of powerful computers The countries of the east are confronted by the daunting task of carrying out simultaneously a structural adjustment, a profound restructuring of the economy and a complete overhaul of economic and political institutions, while facing the prospect of mass unemployment and dealing with a particularly severe environmental crisis, for which they are not prepared

Yet, their predicament and the failure of their socio-economic system do not constitute a proof *a contrario* of the excellence of capitalism It is enough to look at the exceedingly high political, social and environmental price paid for the advances in average economic growth and several other indicators by the countries of the third world, to realise that a sharp departure from the present trends is called for, if the objective is sustainable development as defined above achieved through a democratic regulation of mixed economies [3] This applies equally to the south Asian tigers, that have an uninspiring political and an appalling environmental record

Even more significantly, the welfare states in western and northern Europe—a symbol of civilised and socially responsive capitalism—are showing signs of exhaustion, unable to resist the combined pressure of low rates of growth and of a labour-displacing technical progress The welfare systems have worked well, so long as they were not being put too much to contribution under conditions of rapid growth and almost full employment But now, when the need for social protection is most pressing, they are crumbling under their cost, not speaking of the fact that mere putting of the unemployed on the dole does not shelter them from social exclusion and loss of dignity, work in our societies still has a major socialising function

Social exclusion, spatial segregation, ethnic tensions and dualisation of the economies—themes once reserved to the discussion of peripheric societies—have acquired a universal pertinence A severe deficit of economic and social democracy has become a common challenge of the south, the east and the north alike with no easy solutions in sight

More and more, the international configuration acts more as an obstacle than as a facilitator The world economy has gone through a structural transformation brought about by three 'decouplings' (Peter Drucker) the divorce between the growth of output and the creation of working opportunities, the gap between the GNP and the volume of raw

materials and commodities required to produce it and, last but not least, the loosening of the link between the real economy and the financial speculative sphere expanding in a totally uncontrolled way.

Rising productivity is, of course, welcome if properly managed in terms of equitable sharing of the socially required work and of the product obtained. But this is not the case at present. The pricing of commodities requires international agreements and stabilisation schemes which forty years of discussions have failed to yield. The north-south impasse continues unabated. Absence of controls on the global financial markets, capable of curbing speculation which attracts resources to the detriment of productive investment, constitutes the basic weakness of the Bretton Woods institutions. The IMF does not stand up to its original purpose, preferring instead to play the role of the guardian of monetarian orthodoxy, imposing on developing countries deflation, devaluation and deregulation irrespective of the prevailing conditions and of the social cost incurred.

Recession and unemployment sharpen the struggle for markets. Competitiveness is being sought by all means, without distinction between its legitimate and spurious sources, such as depressed wages, severe underpricing of energy and raw materials, and predatory exploitation of natural resources. Left to the free interplay of market forces, enterprises externalise social and environmental costs of production, playing havoc with the rules of social equity and ecological prudence. That is why redefining of the regulatory role of the states and of binding rules of the game on the international scene is urgently called for. The 1992 Earth Summit started this task, which will be continued in 1995 by the World Social Summit of chiefs of states and governments. Two entry-points could be instrumental in channelling the debate towards operational considerations.

On the one hand, it is necessary to outline need-oriented ecodevelopment strategies, i e, to make sure that the economic system will be able to produce without further environmental disruption all the goods and services required to meet the basic needs of the world population. The concept of basic needs is understood in its 'strong' version (Ben Wisner): It is up to the populations concerned and not to technocrats using abstract norms to define them in their concrete diversity, while at the same time deploying their resourcefulness by identifying in each ecosystem—be it rural or urban—the latent, underutilised or misused resources to be tapped and/or redirected. Ecodevelopment strategies ought to be ecosystem, culture and site-specific. That is why greater local autonomy and meaningful peoples' participation are required, which should not be misunderstood, however, as a way of shunning the responsibility of the central states and of the international system.

On the other hand, in order to make correspond a solvable demand to the production of satisfactors of basic needs, ecodevelopment strategies ought to pay special attention to the creation of opportunities to work and earn a decent wage and/or to self-produce the livelihood. Employment cannot be treated as merely resultant from the rate of economic growth. Fine-tuned employment policies are called for exploring the job opportunities in the following areas:

—resource and energy conservation and recycling, as well as better maintenance of the existing stock of equipment, housing and infrastructure;

—the prospect for a highly productive small-scale agriculture made possible by the second, biology-based, green-revolution;

—the scope for expanding the biomass-uses for energy and industrial purposes;

—the potential for rural non-agricultural employment in decentralised industries based on flexible specialisation;

—the need for expanded public works in order to improve through better infrastructure the systemic competitiveness of national and regional economies;

—the expansion of social services by means of highly labour-intensive delivery systems.

An active policy of employment creation and productive insertion constitute the most effective way of addressing the widespread phenomena of social exclusion.

Special attention should be paid to the first priority listed above, insofar as it represents a clear case of a positive-sum game, in which socio-economic and environmental gains go hand in hand, the more so that many jobs created in the realm of resource conservation might pay for themselves through the saving of resources achieved in this way. For obvious reasons, ecodevelopment strategies should concentrate as much as possible on such 'win-win' opportunities, up to now rather neglected.

The Indo-French book cannot pretend to explore in depth the multifaceted, complex and interconnected problematique just overviewed. We decided to be selective, choosing a limited range of topics; each topic would be treated by an Indian and a French author, expected to look at the problems from their own perspectives and moving from the singular cases of India and of Europe (as exemplified by France) to the consideration of the global challenges facing the crew of the Spaceship Earth and of the distinct responsibilities of the north and of the south in transition strategies towards the 21st century.

3 The collapse of the command economy and the utopian character of an integral market economy leave the mixed economy as the only possible mode of production.

The Flogging of Michael Fay

Culture of Authoritarianism

Vinay Lal

In showing its approval of the flogging of Michael Fay in Singapore, the much touted 'American public' in whose name the American political leadership performs its heroic deeds, has opened the lid on the can of American authoritarianism; this lid is now being sought to be put back into place.

SOME weeks ago, Michael P Fay, an 18-year old American who has been living in Singapore for nearly two years, was sentenced by a court in Singapore to a prison-term of four months and commanded to pay a fine of $ 2,215; additionally, the judge, appositely named F G Remedios, ordered that six lashes be administered on Fay's buttocks, which may not remain snow-white for too long. Fay, imagining that he was in America, where a not insignificant number of people have made vandalism, not to mention murder, armed robbery, and aimless killing, their calling in life, with every encouragement from such quasi-fascist organisations with their largely imbecilic membership as the National Rifle Association, decided to amuse himself by vandalising cars with spray paint and eggs, and tearing down traffic signs which he then hauled home. Perhaps Fay had forgotten that the chicken does come home to roost; the eggs he threw fertilised, to Fay's misfortune, in unexpected ways. Fay is no longer amused; he was shown emerging from the court in unmanly disarray, and a considerable campaign has been mounted on his behalf in order to dissuade the government of Singapore from carrying out the sentence. His mother has argued that the flogging, were it to be inflicted, will scar her son for life and leave him psychologically disturbed, but she appears not to have reflected upon the acute possibility that he must have been quite disturbed in the first place to conduct himself in the altogether foolish manner in which he did, and that too in a place which brooks no nonsense from bored and unsupervised teenagers. No less a person than Bill Clinton, the president of the United States, implored the Singapore government to pardon Fay.

Lest it be supposed that Fay is somehow being singled out to receive this cruel punishment as an American, it should be made clear that conviction for the offence of vandalism carries a mandatory sentence of flogging in Singapore. Every year nearly 600 people are flogged in Singapore, and of this number, slightly more than one-fifth are foreigners. Although flogging is described as a 'cruel' and 'barbaric' punishment, and forbidden outright by such agreements as the International Covenant on Civil and Political Rights, Singapore (along with Malaysia, where too flogging is administered for certain offences) is not a signatory to this agreement. Indeed, in this respect as in many others, Singapore stands apart. The rigidity of the laws by which Singapore is governed is suggested by the fact that the fine for not flushing a public toilet is about $ 32; more onerously, and ominously, the fine for eating on the subway is $ 300. Gastronomic excesses, as nutritionists and scientists have been warning us for sometime, carry a heavy price. The sale of chewing gum, the elixir of a bovine America, is prohibited: that noxious substance, which has dulled many an American sensibility, is described (not incorrectly) as "a perennial nuisance". Drug traffickers are put to death; if mere unlawful possession of a gun carries a life sentence, the firing of a gun not unexpectedly carries a death sentence. The debate that rages in America over the possession of guns would be entirely incomprehensible to residents of Singapore, while so-called progressive laws, such as the one passed not too long ago in Virginia—in the teeth of opposition from the fanatical National Rifle Association—limiting the sale of handguns to any individual to one per month must appear to Singaporeans as farcical.

Singapore has acquired, then, a formidable reputation as a place of 'law and order'; the principal index of its safety is that women can travel anywhere in Singapore, even late at night, without any fear of bodily harm: a *cordon sanitaire* engulfs the small island. This is no mean achievement, and perhaps one would be quite right to insist that no country can claim its adherence to democratic norms when a large number of its citizens, be they men or women, are unable to have complete freedom of movement. Besides the safety of its streets, and the orderliness of life, Singapore must surely be the place destined to epitomise the Protestant craving for cleanliness. The fine for littering is the princely sum of $ 3,185, and pollution (just as much as traffic) is regulated, among other things, by enforcing a strict limit on the number of new cars allowed into the country each year. As an American tourist from Memphis, Tennessee, put it, "Everything is so clean here, you just feel safe and good. Nothing unpleasant could possibly happen here. Cleanliness is next to godliness."[1] Here in Singapore, tourists from middle America in their polka dot polyester dresses and elephantine shorts can feel at ease as they once did in their own towns built with the accumulated fortunes of Wrigley, colonel Saunders, and other purveyors of rubbish.

The safety, cleanliness and extreme orderliness of Singapore's streets are said to be the principal reason why Americans have, much to the surprise of human rights organisations and the small number of those who read and think, overwhelmingly endorsed the sentence of caning passed on Fay.[2] Letters received at the Washington offices of the senators and representatives from Ohio, the sorry state from which Fay hails, and at the offices of newspaper editors throughout the country, have unequivocally expressed their support for the government of Singapore's undiminished resolve to keep Singapore free of crime and punish convicted offenders.[3] Castigating one writer for having described Singapore as a "tight little dictatorship" given to "repression", H Sam Samuelson of San Diego wrote that he saw "nothing wrong with repression when it so specifically and successfully marks crime and criminals and frees a society from fear of its own streets, public parks and front yards". Another letter to the editor of the *San Diego Union-Tribune* expresses rejoicing at the knowledge "that there are still some societies that believe that a little corporal punishment is good for recalcitrant youth".[4] Mike Royko, a nationally syndicated columnist with the *Chicago Tribune*, has reported that '99 per cent' of the letters he has received express jubilation at the impending flogging of Fay, and go on to suggest that "flogging should be part of [the American] justice system". One man wrote to him that "maybe what we need in this country are the same laws and punishment they have in Singapore. We wouldn't have the problems that we have today"; another expressed the commonly held view that "five or six whacks on the can with a cat-o'nine-tails is a great deterrent", while a third was quite unequivocal in his lack of sympathy for Fay: "That American punk is getting exactly what he deserves. If we had similar laws, I'm sure our states wouldn't be under control of the thugs and slugs."[5] Nor is it to be supposed that women have considerably more compassionate feelings towards Fay: one woman pointed to the hypocrisy of citing supposed standards of decency and civility in America, given that "kids can shoot the face off their mother and not be found guilty, and a skater can conspire to seriously harm a teammate and still compete in the Olympics". "Thank

goodness for more sensible people elsewhere in the world", her letter concludes, "who hold our standards in contempt".[6]

Ashamed at the enthusiasm with which the Americans appear to have awaited Fay's flogging, editorialists—who must now take on the mantle of civilisation, though few had any qualms in endorsing George Bush's brutal and barbarous war on the Iraqi people—and liberals have sought to attribute Americans' endorsement of the sentence to their ignorance of the authoritarianism with which Singapore is governed, and to their unhappiness with the war of attrition that is being played out on the streets of America. In Mike Royko's words, the letters he has received "tell us that the justice system in this country is out of step with the feelings of the majority"; in the assessment of a sociologist, "People are desperate. They feel everything is coming apart, that the younger generation is out of hand."[7] More significant is the attempt to argue that though Americans are rightly desirous of living in a country where they do not fear for their lives, and where the 'rule of law' prevails, their views of Singapore would undergo a sea change if they were brought to an awareness of Singapore as a country that is little better than a dictatorship. The *New York Times* has expressed its disappointment that "Americans, in their yearning for order", are prepared to endorse "medieval torture for an act of adolescent mischief",[8] and it is precisely on the 'medieval' nature of the sentence, and thus of the government that has approved it, that numerous other newspapers have dwelled. *The Los Angeles Times*, claiming that Fay has now pointed to the coercion if not torture that was applied to extract a confession from him, has drawn attention to the "well-documented flaws in Singapore's authoritarian system of criminal justice", such as the limited right to legal counsel and against self-incrimination, detention without trial or charges for gangsters and drug traffickers, and trials without jury, and characterised the punishment imposed upon Fay as "a sentence from the dark ages".[9] On the view of one American journalist, the case of Michael Fay represents an opportunity for the government of Singapore to flaunt "its contempt for the western concept of individual rights", and though he is appreciative of the fact that Singapore, "arguably the cleanest, greenest, safest large city on earth", has created an extraordinarily high standard of living for its citizens, he points to the infringements upon "free speech, even free thought", and the "constant fear of their government" with which "many Singaporeans live".[10]

Clash of Cultures

As might be expected, a number of writers have sought to describe the affair as a collision of two cultures, as an instance of "western crime" meeting "eastern justice", the "passion for graffiti", which might almost be mistaken for the disorder of creativity, pitted against "an Asian society's demand for conformity and rigid public order".[11] To Ben Macintyre of *The Times* of London, the punishment imposed upon Fay, and the recent murder of two Japanese teenagers during a car-jacking in Los Angeles, are two episodes that "neatly illustrate the gulf between American and Asian notions of crime and punishment". He is certainly right in stating that in the view of Japanese commentators, Americans appear to have lost sight of the distinction between the life of a human being and the worth of a motor vehicle, but what is particularly 'Asian' about the use of the cane or the cat-o'-nine-tails? Flogging has a very long history in the west, and in England, it might be noted, flogging was abandoned with great reluctance, its use in the navy and on juvenile vagrants continuing well into the 20th century.[12] One journalist has even recalled that in the US, public flogging was a legal punishment in Delaware for robbery, wife-beating, and certain other offences as recently as the 1960s.[13] If Macintyre's historical memory is short, far more disingenuous is Jim Hoagland, who suffers from the opposite defect. A correspondent with the *Washington Post*, Hoagland points to the fact that Singapore is essentially ruled by "ethnic Chinese citizens who have not totally lost the Han emperors' disdain for non-Han cultures". As Hoagland, who no doubt picked up a few 'facts' about Chinese 'culture' in some preposterous class in world history at the high school or college that he attended, argues, *le affair* Michael Fay is to be viewed alongside the recent conflict between the US and China over human rights, in which Christopher Warren was relegated to "a long line of powerful but loathsome barbarians come to Beijing to meddle in China's affairs". Hoagland is quite insistent that the Chinese, whether in China, Singapore, or elsewhere, should be compelled to conform to minimum "international (not American) standards of civilised behaviour", and lest anyone be inclined to think that "American political or cultural imperialism" may have some bearing on the matter, he resolutely concludes that "this conflict revolves instead around thousands of years of institutionalised racism practised by Chinese leaders, from the emperors to the chairman's commissars".[14]

The ghost of 'Oriental Despotism', as we surely know, does not rest easily. Although Hoagland's argument deserves nothing but contempt, it has the virtue of bringing to the fore the arrogance of the west, and its deep-rooted contempt for the other, that might otherwise have been obfuscated. Hoagland belongs to that ilk which would employ force to make the Singaporean Chinese, who are—on his view—nothing but exponents of an "institutionalised racism" (as though the west knew nothing of this abomination), bend to the dictates of a 'global culture' that must perforce be western in its origin. Although Clinton is absolutely right in having described the punishment as 'extreme', it is astounding that some American officials in the state and commerce departments should have threatened Singapore with reprisals if the sentence is carried out.[15] America has never known how to negotiate with difference, and where it cannot have its way, it stands ready to employ its military might. As one American wrote to the *New York Post*, in recommending that the Pentagon take over the matter from the state department, "Having carrier-based aircraft engage in threatening manoeuvres just outside Singapore airspace should send the island country our message: our ability to inflict punishment to protect our people goes well beyond a rattan cane".[16] That is indubitably how the greater part of the American establishment feels.

What accounts for the enthusiasm with which Fay's sentence has been received by the American public, just as much for the jingoistic response of some others, is not the purported dissimilarity between two 'cultures', but rather the peculiar circumstance that America and Singapore are two countries that fully understand each other. Singapore has, of course, been one of America's great friends and trading partners in Asia. Although conservatives are now feverishly pointing to the authoritarianism with which the regimen of 'law and order' is maintained in Singapore, as something that greatly attenuates the economic accomplishments of this 'Asian tiger', the support of authoritarian regimes has been one of the few consistent elements in American foreign policy over the course of this century. The American elite has always had a large spot in its heart for authoritarian leaders: like attracts like, no? One might recall that Jeanne Kirpatrick, who exemplified the American phenomenon by which utter mediocrities are catapulted to positions of dangerous eminence, had made the invidious distinction between 'authoritarian' and 'totalitarian' regimes the cornerstone of Reagan's foreign policy. Authoritarian regimes, being supportive of the free market, were deemed to be friendly and worthy of support, however, brutal the manner in which they dealt with their subjects; totalitarian regimes, on account of their advocacy of Marxism-Leninism or some other form of communism, were rendered into targets of American intervention and attack. What, then, is this excitement about the authoritarian regime of Singapore, America's trusted friend, the star pointing to the road to happiness, peace, and prosperity for Asia's impoverished millions?

Singapore and the US share, as I would submit, a culture of authoritarianism. Hegemony is never as successful as when it masks power and renders compliance with

those myths by which dominant powers seek to shape and rule the world. In showing its approval of the flogging of Michael Fay, the much touted 'American public', in whose name the American political leadership peforms its heroic deeds, has opened the lid on the can of American authoritarianism; this lid is now being sought to be put back into place with the exhortation, to quote from the *New York Times*, one of the principal organs of American hegemony, that "America, the land that led the world in decrying cruel and unusual punishment, must demonstrate that order bought with torture is never worth the price—at home or abroad".[17] Americans can be cajoled, but when America's partners in authoritarianism, particularly when they are not of European stock, have the temerity to unmask some great myth, or to upset the hierarchies that nature herself has supposedly ordained, the demonstration must be of a different order. How this demonstration might be achieved is suggested by the case, wholly unusual in the annals of colonialism, of the flogging of Phinehas McIntosh.[18] Much like Michael Fay, Phinehas McIntosh, a drunk, vain-glorious, and womanising Irish lout living in Bechuanaland [now Botswana] in the 1930s, had the habit of making a nuisance of himself. At long last, the native chief, Tshekedi, ordered that McIntosh be flogged; summoned before the native tribunal, he was nicked with a whip twice. The great transgression had been committed; a white man had, for the first time, been 'flogged' by someone not of his own race. The official reaction was not merely to suspend Tshekedi from the exercise of his duties; a large naval force was rushed to the area to ensure compliance and prevent an imagined rebellion.

Notes

On the Border of Fascism

Manafacture of Consent in *Roja*

Rustom Bharucha

Within the emerging maelstrom of media forces in India, our thoughts are being thought for us in ways that would make the indoctrination of traditional authority figures almost mild in comparison. Market and the state (and their collusions), by a range of media representatives, constitute a form of cultural fascism which is liberal and even idealistic on the surface but dangerous in the hold it has on people's minds and votes. The film Roja *needs to be seen in this overall context in order to grasp its subtle extension of the 'manafacture of consent' by which the crisis in Kashmir is being circumvented by the government.*

THERE are many borders implied in this essay which covers a difficult and tricky ground, one that I cannot claim to have fully grasped because it is just beginning to emerge. It is a ground that covers the lure (and the lies) of nationalism but not in a directly political context. Rather, it is mediated and disguised through layers of cultural expression which have been consolidated through a 'manafacture of consent'[1] engineered by the agencies of the state in the market and the media. As the essay moves towards an elaboration of this 'consent', it also inscribes the difficulties involved in naming fascism in the Indian context. This is the subtext of the essay, an underlying leitmotif which does not always surface but which remains an unresolved problem that troubles me beyond the writing of this essay. Somewhere within and outside ourselves, we need to confront that dangerous border when nationalism becomes fascism, not by denouncing the other and subjecting ourselves to further aggression, but rather by questioning our own complicities in the legitimisation of violence around us.

Tellingly, the provocation for this essay has not been sparked by a direct confrontation of the *realpolitik* or a re-reading of Gramsci but by something more immediate and seemingly trivial: the all-India box office hit *Roja*, a film that hovers between the genres of romance and a political thriller dealing ostensibly with 'terrorism' in Kashmir. Not only has this unprecedented commercial blockbuster received the implicit blessings and very direct support of the ministry of defence, it has also been awarded a prize for national integration from the government of India, whose authoritarian chief election commissioner has gone on record testifying the patriotic credentials of the film.[2] Not to be outdone, it appears that the votaries of the Hindu right in the Bharatiya Janata Party, notably its leader L K Advani, have also endorsed the message of the film. And the general response not only in the mass media but among intellectuals and a great many activists as well has been largely positive, if not overly enthusiastic in a mindlessly jingoist manafacture of consent.

One could avoid writing about *Roja* altogether (even critiques are likely to contribute to its hype) were it not for the fact that the film has also been described by a minority of its dissenters as 'fascist'. Now fascism is a serious business, dangerous not only in the *realpolitik* but in the context of cinema, and any use of the term demands qualification and analysis. Fascism should not be assumed any more so than it needs to be glibly dismissed. The immediate—and tantalising—task of our times is to name fascism with critical responsibility.[3]

Significantly, I first encountered this description of the film as 'fascist', in a seminar on communalism, a subject on which we are becoming increasingly eloquent even as its realities congeal, go underground, and occasionally explode. The fact is that communalism has entered public discourse in multiple idioms and contexts—economic, political, cultural, critical. Apart from an increasing exposure of facts and figures, investigative reports, polemics on violence, there is also a growing discrimination in defining and even texturing different modes, narratives and strategies of communalism so that today we are somewhat better prepared to represent its realities even if we are unable to change them. The market has also contributed favourably to the subject with a commitment to business rather than to communal harmony.

If things are looking up for communalism on the intellectual front, the same cannot be said for fascism. Despite its close complicities with communal violence, it remains relatively unrepresented in critical discourse, where it enters fleetingly, more often than not in an alarmist mode. As much as we may be aware of the subterranean infiltration of fascist tendencies in our culture, it is still strangely difficult to name these tendencies as specifically fascist. It could be that we continue to live (or so we would like to believe) in a fractious democracy in India, whose foundations endure, however vulnerably, despite the recent spate of communal, fundamentalist, and secessionist attacks. The reluctance to name fascism could also emerge from our awareness of its historical contexts in the Third Reich and Mussolini's dictatorship, regimes of indoctrination that have been internalised at depths and levels which are not entirely familiar in the Indian context. But perhaps, this rationale could well be a wish-fulfilment on our part, an evasion of responsibility in confronting symptoms of fascism in India today.

About the only significant piece of writing in the aftermath of December 6 that has taken on the task of defining fascism in the Indian context is Sumit Sarkar's exemplary analysis of 'The Fascism of the Sangh Parivar'—exemplary, I stress, because it has both the courage and the historical preparation to name fascism with a deep sense of responsibility and rage.[4] Two particular characteristics of Sarkar's analysis (which will be echoed in my critique of *Roja*) are worth noting: the emergence of a "communal consensus" in which "a whole series of assumptions and myths have turned into common sense", and the construction of "a powerful and extendable enemy image" through the appropriation of old prejudices and the combination of new ones, which are being propagated on the media with increasing intensity.

Despite the boldness of Sarkar's intervention, one would also have to acknowledge that it is, perhaps, easier to name the fascism of the Sangh parivar than its allies, whose 'connivance and implicit sustenance from within the highest corridors of power' have almost legitimised fascism within the framework of democracy. It is in naming these allies that the "responsibility of intellectuals", in Noam Chomsky's unfailingly resonant words, "to speak the truth and to expose lies" proves to be extremely difficult. It is infinitely safer (or, should one say, politically strategic) to resort to euphemisms and leave the 'highest corridors of power' unnamed.

Indeed, we could easily deflect the entire problem of naming fascism by focusing on an infinitely more acceptable category of analysis—propaganda. Keeping this in mind, it is useful to address Ashis Nandy's three-tier framework of propaganda in which we learn that countries like India (and Pakistan) have apparently passed the initial stage of not suspecting the "hidden agenda" of the government's messages on the media to a more sceptical stage where "thought control" is increasingly perceived in the context of the "national interest argument".[5] In this evolutionary process of media conscientisation, it would seem that third world countries have yet to reach the final stage perfected in the most propagandised of capitalist societies, the US, where within the rhetoric and legislation of 'free speech', 'pluralism', and an

abundance of 'choices', there are severe limits placed on areas of 'public scrutiny', notably in exposing the lies of the government, which are erased and legitimised through the most subtle regimentation imaginable.

The reality is that while 'we' in countries like India may not have reached that stage yet, we are fast approaching it. With the increasing power of the media in India and the invasion of the satellite networks, we are being enveloped by a capitalist media culture without the infrastructure or resources to dismantle the messages and images infiltrating our cultural space. Quite simply—and critically—we are not sufficiently prepared to identify the 'manafacture of consent' which has a long history in countries like America dating back to the 20s when it was associated with the propagation of democracy and then picked up by the public relations industry, political science academia, and the entertainment business.[6] Ironically, this quintessentially American state of being 'brainwashed under freedom' is what our government has tacitly accepted and endorsed even as it continues to adopt an anti-American stand in relation to political controversies relating to nuclear disarmament and human rights violations in Kashmir.

Within the emerging malestrom of media forces in India, we find that our thoughts are being thought for us in ways that would make the indoctrination of traditional authority figures like gurus, parents, teachers almost mild in comparison. Not only are 'our' traditional cultural values being affected (the hypocritical lament by almost all politicians), the very perception of culture is being determined by the growing hegemony of national and global market forces, whose right to interpret the world is being propagated almost without dissent. This peremptory and fundamentally uncritical valorisation of the market and the state (and their collusions) by a range of media representatives in advertising, television, journalism, commercial cinema, constitutes to my mind a form of cultural fascism—liberal and even idealistic on the surface, but dangerous in the hold it has on peoples' minds and votes.

Roja, I believe, needs to be seen in this overall context in order to elaborate on its subtle and undeniably inventive extension of the 'manafacture of consent' by which the crisis in Kashmir is being circumvented by the government. Far from being a freak box-office hit, the film has been made possible through the larger 'consent' of the media culture surrounding it. In turn, it has contributed to this culture substantially by inscribing (and thereby, reinforcing) the official scenario on Kashmir with an illusion of reconciliation. Ultimately, Kashmir is 'ours', the sovereignty of its people a secondary issue to the territorial integrity of the state within the larger framework of the nation. After all, as our ministers across parties have unanimously declared, "Jammu and Kashmir has been, is, and shall be an integral part of India".[7]

Naming Fascism

Before opening the fascist dimensions and undercurrents of *Roja*, it is necessary to reiterate and inflect the question raised at the start of this essay: How does one name fascism in the Indian context? More specifically, how does one name fascism in Indian cinema? This is an even more difficult question to confront in the absence of an adequate theoretical discourse on the subject. What emerges from polemical essays and interventions in debates are scattered references to the manipulation of mass audiences through the 'ideological weapons' of techniques; the bombardment of visual stimuli in narratives devoid of 'breathing space' which prevent spectators from 'thinking' or even 'seeing'; the voyeuristic use of spectators as instruments of violence; the 'divinisation' of stars as cult figures beyond history; the stranglehold of the market and the underworld in manafacturing 'dreams' of an increasingly lumpenised culture.[8] Fascism lurks in all these phenomena without being crystallised or even named.

About the most sustained critique in film studies that attempts to contextualise symptoms of fascism in the Indian context is MSS Pandian's *The Image Trap*, which exposes the MGR phenomenon within the interstices of Tamil politics and cinema.[9] Significantly, the study is prefaced by a quotation from Walter Benjamin that sets the 'frame' for the entire book:

> Fascism sees its salvation in giving these masses not their right, but instead a chance to express themselves. The masses have a right to change property relations; fascism seeks to give them an expression while preserving property. The logical result of fascism is 'the introduction of aesthetics into political life'. The violation of the masses, whom fascism, with its *Fuhrer* cult, forces to its knees, has its counterpart in the violation of an apparatus which is pressed into production of ritual values.

This memorable statement of fascism resonates unconsciously at multiple levels in Pandian's documentation of the political realities underlying MGR's "constructed biography" and the even more terrifying endorsement of this "biography" by "the people" who saw in their chief minister a saviour figure, "the undisputed patron saint of the poor", who is deified even after this death.[10]

However, after the context of the MGR phenomenon has been made explicitly clear, when we are waiting for fascism to be named and analysed both politically and cinematically, if only to refute or differentiate it from Benjamin's perspective, it is significant that this moment never arrives. The possibilities of naming fascism are elided through an even deeper and layered elaboration of the construction of "common sense", substantiated through references to the "pre-existing cultural practices of the subaltern classes". In the process, the task of confronting fascism is sublimated through a 'subaltern' discourse, so that when there is *one* reference to the MGR phenomenon in specifically fascist terms, it is almost apologetic: "...in both real life and on the screen, MGR was presented as one among the common people and at the same time he was distant from and stood above them. Perhaps, we may mention here that this is very similar to the manner in which fascist propaganda projected Hitler".[11] Instead of deepening this valid connection, the critique is promptly authenticated (and in the process, diffused) through references to Adorno's use of Freud's psycho-analytic categories in exposing the dual impulses of the "great little man", who is at once 'omnipotent' and just "one of the folks, a plain, red-blooded American".[12] MGR is almost an afterthought in these larger references to fascism.

This brings us back to the difficulty in alluding to fascism without naming it. The problem is not semantic but political. Empathising with it rather than denying its intransigence—I am not free from the problem myself—it becomes possible, perhaps, to name the unnamed by pushing the existing categories of oppression which are acceptable in the mainstream of political and cultural discourse, and at some point, in subverting the accepted premises of dissent. In the process, one must be prepared to test and challenge the assumptions of one's own politics and loyalties to larger, people-oriented mass movements, which may be perilously close to or appropriated by the fascist tendencies one is attempting to expose.

One's critique is, therefore, vulnerable at very personal levels because it may be misunderstood by one's own colleagues in being assumed to undermine common commitments. In raising the difficult question, "At what point does a mass movement become potentially fascist", the response is generally guarded. Silence is sometimes recommended. But more often than not—and particularly, at this point in time—silence could simply be an acknowledgement of fear or a loss of words.

The task of naming fascism, therefore, is fraught with risks not only through attacks from fascists themselves (unacknowledged or otherwise) but through the burden of self-censorship. The act of naming also brings to a head the inner struggle of submitting to 'political correctness' and being 'honest', which are not necessarily synchronous.

To provide a context for this struggle in a somewhat different register, it would be useful to recall the dilemma posed to intellectuals world-wide when the resistance to communist rule by groups like Solidarity in Poland was beginning to be voiced and addressed. In one such forum in New York, Susan Sontag shocked and alienated quite a few of her supporters by recanting as it were from her earlier position in the late 50s, when she had refused to accept any criticism of communism, equating this "propaganda" with an endorsement of "McCarthyism".[13] Later in 1982 at a rally for Polish Solidarity in New York, she acknowledged not without a somewhat glib self-critique that "Communism is

fascism—successful fascism, if you will". By earlier "identifying the enemy as fascism" and believing unquestioningly in "the angelic language of communism", Sontag admitted that a "great deal of untruth" had been "countenanced".

Not surprisingly, Sontag was taken to task by a wide range of thinkers including Chomsky and Foucault who pointed out the reductive dangers of her equation between communism and fascism and her disregard for the New Left critique of communist demagoguery Her own tendency to "exaggerate" everything was also highlighted, which encouraged her "not merely to say explosive things that are absurd...but often, to say explosive things because they are absurd." While accepting the validity of these criticisms, one should also acknowledge that Sontag was touching on a very sensitive nerve in illuminating the dubious ethics by which the lies of the 'enemy' are exposed at the expense of confronting the lies endorsed in fighting the 'enemy'.

Does the responsibility of intellectuals ultimately lie in exposing one set of lies at the expense of silencing others? How does one strategise one's own evasions? And to what extent can one justify them for 'the common good'? What are the limits of protecting lies in the national interest? These questions resonate deeply in the Indian context today and are at the very heart of the representation of Kashmir in the *realpolitik* and cinema.

Constructing the Enemy

About eight years before Sontag equated fascism with communism, she had written one of her most thought-provoking essays 'Fascinating Fascism' (1974) on the rehabilitation of one of the most "artistic" propagandists of the Third Reich, Leni Riefenstahl.[14] While it is established in film circles that her *Triumph of the Will* was admired by the Fuhrer himself as "a totally unique and incomparable glorification of the power and beauty of our movement"—indeed, he and Goebbels collaborated with Riefenstahl on staging the second National Socialist Party congress to meet the demands of her *mise en scene*—the director herself constantly reiterated in the post-war years that her film was not propaganda but *cinema verite* ("It is history—*pure history*"). And the fact is that this is how many enlightened spectators have chosen to believe in her work, justifying or denying her propaganda with a wide range of rationales.

It is not necessary to enter into the details of this debate except to stress for the purpose of this argument that propaganda in cinema—fascist or otherwise—is not always recognised as propaganda. Indeed, the idiom of propaganda does not have to be tendentious or overtly political at all. Rifenstahl's Nazi affinities can be studied in her more 'innocent', commercial alpine romances, as Sontag indicates so brilliantly in the process of reminding us that the "formal structures and themes of fascist art" can also be traced in entertainments and spectacles like Stanley Kubrick's *2001 Space Odyssey*, Busby Berkeley's *The Gang's All Here*, and the great family musical Walt Disney's *Fantasia*.[15]

This provides a valuable clue towards opening the fascist dimensions of *Roja*, which is one such 'entertaining' film, a patriotic romance that sets a young couple against 'terrorists' in Kashmir with the state providing the necessary link. The film is dangerous not because it is obviously so, but precisely because it is so refreshingly 'innocent'.

On the surface, *Roja* carries its political agenda lightly which is part of its deadly charm. Subalternity is restricted to the rural family background of the heroine (Roja), more of an idyllic backdrop than a source of struggle. The class base of the film, however, is determined by the metropolitan hero, Rishi Kumar—a nice, suitable, brahmin 'boy', who desires a bride from a village because he has "fallen in love with the soil of the place", as he disarmingly admits. He is obviously educated enough to be a cryptologist, a profession that he assumes with a certain cool, his affiliations to the topmost intelligence services in the country handled with an understated nonchalance. This patriotic Indian is also an indigenised yuppie, a distant figure from a subaltern hero or rabble-rousing activist.

Even his patriotism appears rather unselfconscious in comparison to the nationalist blockbusters of the past, notably Manoj Kumar's lachrymose rhetorical dramas on 'service to the nation' in *Shaheed, Upkar* and *Roti Kapda Aur Makan*, in addition to Chetan Anand's more strident *Haqeeqat* on the 1962 Chinese debacle, where 'mongoloid' Indian actors contributed to the construction of a 'foreign' enemy image.

It is only in recent years, with the communalisation of popular culture in India, that 'enemy images' in cinema have been marked with specific political signs in the Indian context. Earlier 'enemies' were subsumed in the larger category of 'villains.' And villains have almost invariably been entertaining, exaggerated, histrionic figures—think of good old Pran swigging a bottle of VAT 69 plotting revenge against the hero. The nostalgia is almost immediate. Later, as filmic narratives became more violent, the villains were more sharply individuated, acquiring almost bizarre dimensions in non-realist and hyper-realist modes of performance. I am thinking here of the larger-than-life Gabbar Singh in *Sholay*, the megalomanic Mogambo in *India*, the frenetic 'oriental' spy Dan in *Karma*, and more deviantly, the outrageously transvestite Maharani in *Sadak*, who is both the madame of a brothel and a don of the underworld. At least two of these figures are clearly cast as destroyers not only of the 'community' but of the 'nation' at large. Indeed, when Dilip Kumar finally corners Dan in *Karma*, he proceeds to riddle bullets around him with a machine-gun, creating in the process that unforgettable image of a map of India. At one level, this is a nationalist inscription with a vengeance, but the cinematic construction is so wild that one is compelled to applaud its ingenuity. Xenophobia is not the issue, but rather, the flair with which the *coup d'etat* is executed.

These references to earlier modes of villainy (which are not 'innocent', steeped as they are in sexist and lumpen glamorisation) provide a point of reference, nonetheless, for examining the very different construction of the 'enemy' in *Roja*. Here there are no villains in the earlier sense, but enemy figures who are specifically marked as 'Kashmiri' and 'Muslim'. Their representation is almost low-key, even 'realistic' by commercial film standards. Far from being flamboyant or even caricatured, they are played in the context of verisimilitude. They even 'look' Kashmiri, the 'terrorists' being represented by north Indian actors, the leader Liaquat played by Pankaj Kapoor, who is better known all over India as the Hindi-speaking 'masterji' in the popular television serial *Zaban Sambhalke*, which focuses on the teaching of the 'national language' to all communities in India.[16] The fact that Liaquat is able to communicate with Rishi Kumar from Tamil Nadu is 'explained' through his earlier study of BSc Agriculture in Coimbatore.[17] These are the 'naturalist' details, the 'lower depths' to which Mani Ratnam is capable of sinking in order to substantiate the 'reality' of his narrative.

More than one enthusiast of *Roja* has undermined the danger of its representation of the 'enemy': "There are no black and whites in the film, but varying shades of grey. Mani Ratnam does not paint the militants as totally evil, but merely as deviants in a society gone wrong."[18] This, according to a reviewe , is "where the genius of *Roja* lies." Precisely: the 'genius' of propaganda, which makes you believe that Ratnam is sympathetic to these 'deviants', who incidentally are not 'militants' but 'terrorists.' (In the Tamil version of the film, the use of the word 'theveravathi' ('terrorist'), is specifically distinguished from 'porali', ('militant')—a distinction that has become particularly conspicuous since Rajiv Gandhi's assassination.)

How, one wonders, are these 'objective' reviewers capable of forgetting that these 'deviants' are also presented in a rather monstrous light? The hawk-like, sinister persona of Wasim Khan is never once humanised. In a sense, he continues to be a 'villain' in the earlier mould of Indian cinema, but his frenzy and somewhat demented demeanour are contained within the framework of naturalism. Liaquat is more 'civilised', but let us not forget the knife that he points at Rishi Kumar's neck, drawing a trickle of blood (very discreet, but sadistic nonetheless); the slaps that he inflicts on his sister (whose compassion is problematically silent); and the blows with which he hammers the hero in the *Jai Hind* sequence. The very rhythm and movement of the camera are positively menacing when we first encounter the 'terrorists' in their own terrain, when at abrupt intervals, they appear suddenly like predatory guards, masked and pointing their guns directly at 'us' in the

audience. How can all these details be regarded as 'grey' in representing the 'terrorists'?

Of course, the menace of the 'terrorists' is not conveyed through violence alone but through the more ambiguous sign of prayers. Are there any 'greys' to be found in the synthesised calls to prayer on the soundtrack which resemble the wails of banshees? Is there any 'balance' in the disorienting angle of the shot depicting Muslims praying—a shot that is deliberately inserted in a sequence of images representing 'Kashmir' when it reappears in the middle of the film? The other shots (almost like quotations) accompanying this image are the army drill and an explosion. Prayer is interspersed between maintenance of order and its disruption. Why does 'Islam' have to be quoted so emphatically and equated with disturbance?

The most insidious representation of 'Islam' is when Liaquat is praying while Rishi Kumar is going berserk rolling on the ground while attempting to extinguish the national flag burned by the 'terrorists'. What almost every single reviewer has relished about this sequence is its great act of patriotism, the more astute pointing out that 'our' hero Rishi Kumar resembles one of the Mandal commission agitators in his flame-resistant blue jeans. But what needs to be emphasised is that this sequence does not begin or end with Rishi Kumar but with Liaquat praying and ending his prayers by wiping the palms of his hands over his face, and then jerking his head in the direction of Rishi Kumar (off-screen). These are the punctuation points that frame the entire sequence, the patriotic tumult (accentuated by hysterical chants on the soundtrack rising in a crescendo, declaiming the 'oneness' of the country) interspersed with shots of Liaquat praying with an almost fanatical calm.

Underlying the orchestration of the scene is a principle drawn from Mani Ratnam's deepest influence as a film director: advertising.[19] The principle is one of foregrounding a particular message by filling the background with seemingly irrelevant and contradictory details. To reiterate a truism, what is being sold in an advertisement of soap, for example, is a particular style of living and thinking without which that particular brand of soap would have no 'marketable' value. In a strategically altered mode, Ratnam is 'selling' the hottest brand of nationalism and to make it not just palatable but desirable, he is setting the mood not only with sharp cuts and a rousing soundtrack but through the juxtaposition of negative images of the 'enemy'—some hyperactive 'terrorists' beating the hero up; one absolutely still, a man lost in prayer.

This is the central sequence in *Roja* that borders, to my mind, on fascism, echoing the feverish pitch of the opening sequence of the film in which we (in the audience) enter the frame of action along with the rifle-wielding militia accompanied by Alsatian dogs straining on the leash in hot pursuit of Wasim Khan. Our empathy with the army is monitored kinetically from these very first images, and the pace is sustained in the subsequent Kashmir sequences reaching its climax in the flag-burning episode. Here the peaking of nationalist fervour is consolidated, I repeat, through the inscription of the 'enemy' (Liaquat), whose 'faith' is so intense (rather like his primordial link to the concept of jihad) that it seems to transcend reason, humanity, history. It is a non-negotiable source of power that is ultimately linked to the perpetuation of violence. And the only legitimate counter to this threat is a delirious state of self-sacrifice driven by the hero's uninflected courage and surrender to the highest ideals in fighting for the nation. Here he is not just defending the nation with patriotic cries of *Jai Hind*, he is entering a state of hypernationalist transcendence.

Sympathy Factor

If there is one aspect in *Roja*'s narrative that has been consistently misread, it is the 'sympathy factor' which has diluted the 'enemy image' of the 'terrorists' without altering its essential violence and threat. At even subtler levels, the 'sympathy factor' conditions one's viewing of Rishi Kumar's boss who is a top consultant for the Indian state in deciphering enemy codes.

This benign, fatherly figure carries his authority so lightly that it would seem somewhat exaggerated to cast him in the context of 'the authoritarian Indian'. Certainly, he is not one of those victims of technology, science, and westernisation in modern India who is "psychologically uprooted" and desperately in search of "total ideologies and value-systems".[20] On the contrary, the boss in *Roja* is a thoroughly, 'rooted', traditional brahmin, his connections with scientific knowledge judiciously balanced with his understated religiosity. In his office, there are computers and a neat row of religious pictures, including a photograph of Ramana Maharshi. In addition, he is the only person in the metropolis who is able to establish an immediate, nativist link with *Roja*, querying her about local food preparations and the location of temples.

Though he appears only in two scenes, his sudden (and convenient) illness precipitating Rishi Kumar's trip to Kashmir—indeed, the boss provides the structuring principle on which the narrative of *Roja* pivots—one realises the political resonances of his role in the context of what Ashis Nandy has illuminated about the psychology of fascism in India:

> Even when the authoritarian Indian takes a revivalist position, thereby trying to return to the uterine warmth of an idealised past and an idealised motherland, what he projects into the past and into the concept of the nation are nothing other than conventional western middle class values.[21]

This is the paradox of the 'rootedness' conveyed by the boss insofar as it coexists, and perhaps reinforces his affinities to the most lethal 'westernisation' embodied in the mechanisms of surveillance facilitating the protection of the nation. Through his affiliations to *Roja*, a direct link is established between espionage in the national interest and the exaltation of the community so conspicuous in the celebration of village life in the first half of the film.

Whether the village is named Sundara Perumal Puram (as in the Tamil version of the *Roja*) or Sunder Bhanpur (as in the Hindi version), the fact is that this is a synthetic pan-Indian village whose geography covers a panorama featuring almost all aspects of the national landscape including mountains, fields, waterfalls, running brooks, creeks. The village is also essentialised as a totally harmonious social structure dominated by old women who play an active role in celebrating Rishi Kumar's wedding night, gyrating lasciviously to the strains of a pornographic song highlighting the thrill of coitus. Here, unlike the more discreet sexuality of the couple's first night in Kashmir, Ratnam does take a risk in stretching the norms of titillation in commercial cinema by making old women (significantly no old men) compete with the frenzied dancing of the village youth, whose violent pelvic thrusts are counterpointed with the more sinuous movement of sexy mother-figures.

Once again, if this is 'acceptable' as part of the Roja's world, it is because the treatment of the community is overwhelmingly sympathetic. Apart from a slight feud in Roja's family, which is countered through her grandmother's intervention, there are no caste tensions, no panchayat politics, no blatant disparities in income—in short, we are presented with a totally 'unreal' utopia from which Roja is thrust into the *realpolitik* of Kashmir.

The 'sympathy factor' is, perhaps, strongest (and most deceptive) in the projection of Roja herself as an 'individual' who is able to expose the limitations of the state. In one of the most analytical readings of the film provided by Tejaswini Niranjana, we learn of "the failure of the state, which cannot defeat the militants, cannot rescue its employee, a failure that can be made to justify a middle class rejection of it in favour of liberalisation and free enterprise".[22] In a more journalistic vein, this statement has been reduced to a punch-line: "The system has failed; it's up to the individual".[23] Certainly, the most symptomatic moment in the film that substantiates this view is Roja's sharp (and much-quoted) rejoinder to the colonel, when he declares that her husband cannot be released in favour of Wasim Khan: "Would you say that same thing if a 'mantri ki beti' were kidnapped? Is a mantri ki beti more important than my husband".

Here, too, as in the sequence with the burning flag, there is double message at play. Overtly, there is sympathy for this brave young wife who is obviously familiar with the *realpolitik* to recall the kidnapping of an erstwhile home minister's daughter by Kashmiri militants and her subsequent release through government intervention at the highest levels.[24] In articulating her position in opposition to that of the privileged mantri ki beti, Roja is obviously striking a chord—

she is 'one of us'. But significantly, she is also striking a chord with the colonel, who listens attentively, even compassionately, and later intervenes on her behalf so that Roja can directly address a minister from New Delhi about the release of her husband. And miraculously, with no bureaucratic hassles whatsoever, the government agrees to release Rishi Kumar. The order may come 'from above', but the agencies facilitating them are essentially benign and understanding. I would contend, therefore, that 'we' (the people watching *Roja*) are given the illusion that the state needs to be defied, but in actuality, the state is *with* us and is even willing to be guided by us.

In this context, though Roja does take the initiative when the 'terrorists' fail to deliver Rishi Kumar, she is accompanied by an entire battalion of rifle-wielding soldiers who protect her. In their vigilance, which is more ceremonially visible in the army parade represented earlier, we witness the most efficient demonstration of military power in the history of Indian cinema. It is the 'terrorists' who bungle, while the army keeps its word with the necessary precautions. The only inefficient member of the state is the poor sentry who falls asleep on duty outside Roja and Rishi Kumar's hotel room in Srinagar, but then, he does not belong to the rank and file of the army.

In short, it is a euphoric misreading to imagine that *Roja* is celebrating individualism above the power of the state. The fact is that Roja and Rishi Kumar are integrally a part of the state. If the fervent wife gets hysterical and places her husband above the state, that is only to be expected. Ultimately, it is the patriarchy of marriage and the benevolence of the state that protect her. In the concluding shots of the film, as the army scurries off in pursuit of Liaquat (no 'happy end', I imagine, for him once he is caught), a sobbing Roja drops at her husband's feet, reliving that eternal icon of the devoted Indian wife. The husband picks her up and gently caresses her cheek, but—this is a telling sign—there are no tears, not even glycerine drops. Somewhere in the chemistry of Mrs India and the system sustaining her, there is a triumph of the will.

Manafacturing Consent

There is more that can be read in *Roja*, but a sufficient context has been provided, I believe, to examine how the official position on Kashmir is being validated in the larger endorsement of the film. Not only is the hype surrounding the film directly related to public relations and big business, it is more disturbingly orchestrated to enhance an integrationist image of Kashmir for which the government has awarded the film by waiving its entertainment tax. More than the rave reviews which have gushed about *Roja*, the more disturbing critiques are those which have self-righteously vindicated the 'patriotic' premises of the film with a specious objectivity.

No issue has been more earnestly—and hypocritically—defended than the representation of human rights as is evident in the following response:

> Of course, the Indian army is not a bunch of Sir Galahads. Of course, there have been human rights violations. Sadly, a lot of our intellectuals are totally silent about the other side of this: the human rights violations of the terrorists. Sadly, no one also writes about the army jawan spending his days in constant danger in unfamiliar and hostile territory. What's wrong with saying good things about our military then? What is wrong with showing courageous soldiers?[25]

Even if one wanted to parody a defence of the state, I do not think this statement can be surpassed. The human rights argument (why do not you show the poor jawans suffering?) is characteristic of the pitch on many features, documentaries, and talk shows on Doordarshan, which are going out of their way to elicit (and exploit) sympathy for the suffering jawan.

If there have been human rights violations by the army, then why keep silent about them? In a spirit of objectivity, show 'both sides of the picture'. Along with Liaquat beating Rishi Kumar, Why do not we also see the Indian army picking up civilians from the streets, searching houses at random, killing demonstrators in self-defence, and 'worse' (the euphemism for rape). The problem with showing 'courageous soldiers' is not that they lack courage but that they are capable of a totally unjustified violence, which even the state has been compelled to acknowledge.[26] But to show these violations, one would necessarily have to show 'people'—and that is one category of the human race that is conspicuous by its absence in the Srinagar of *Roja*, apart from two cursory shots of a newspaper boy and a row of detainees lined up against a wall.

Once again, there can be perfectly 'justified' reactions: "The film clearly explains that there are no people on the streets because there's a curfew on. Reviewers should do well to watch the film—which after all is providing his bread and butter—instead of looking for Hindu communal snakes under the seat".[27] The fact that a director has multiple options within his fictional framework to present the contradictions of a situation is obviously lost on this 'critic'. Why does Kashmir have to be reduced in *Roja* to a confrontation between 'terrorists' and the army with a romantic couple caught in the cross-fire with one displaced Tamil tour-guide providing some comic relief? What is the politics of this reduction? What is it saying (or not saying) about the people who live in Kashmir and who are neither 'terrorists' nor members of the army? Why are they erased? These questions have serious political implications, and they cannot be dismissed through claims (with no concrete evidence) that *Roja* is extremely popular on the video circuit in Kashmir. Instead of assuming some kind of subaltern endorsement in this 'fact', I would be compelled to probe who exactly is watching the film (apart from the army) and what is being perceived.

The defence of *Roja* in these earlier paragraphs is a fine example of the 'pragmatic criticism' that Noam Chomsky has cautioned against in his reflections on the 'manafacture of consent'. Through a seemingly reasonable and self-righteous stand, the 'pragmatic' critic actually contributes to 'thought control' by working within the rules of the game. Democratic systems do not merely tolerate such criticism, they even welcome and honour it on occasion because it contributes to the larger myth of a free exchange of ideas. Obviously, there are different levels of expertise in reinforcing the premises of the state, but they meet through a common ground of complicities which empower what people think. These complicities are 'manafactured' not by force, but through the most 'open' and, at times, inane of exchanges.

Inanity is frequently the distinguishing mark of propaganda in a democratic system. In the magazine culture that proliferates under its patronage through 'free enterprise', it is not uncommon for a certain mindlessness and vacillation to be upheld as a norm. Thus, in the *Sunday* magazine cover story of *Roja*, after mock-serious dismissals of the film's potential danger (it will not lead to "raucous calls for our own *lebensraum*") and a tacit acknowledgement of its "jingoism...that could stick at the level of the subconscious", the ultimate verdict is that the film "might or mightn't lead to anything".[28] When a critical attempt is made to counter this evasion through a position, it is generally dismissed with a facile quip: "*Economic and Political Weekly* now carries turgid academic analyses of the film, and every kitty party in the capital seems to revolve around *Roja*".[29] As part of the same trivial rhetoric, another appreciative comment on *Roja* is inscribed in a feature on the Miss India Beauty Competition. On Kashmir in particular, the first runner-up is definitely worth quoting: "It's India's Eden. How could anyone think of giving it away?"[30] This casual angst for a potentially lost paradise is symptomatic of a growing public consensus that Kashmir is 'ours'.

Sometimes in the midst of quips and chatty columns, there can be some down-to-earth advice from veteran journalists like Khushwant Singh, whose capacities to combine the personal, the political and the sexual have endeared him to millions of readers and the state. While breezily dismissing a "Punjab-like solution" to the Kashmir problem, and advocating a need to break the deadlock created by Indian and Pakistani governments through "the pressure of public opinion in both countries", Singh ultimately neutralises the validity of his points by chatting about other matters, ranging from the death of a film star's father to the growth of cactus to the translation of a love poem to his inevitable dirty joke.[31] By the time you have read it and attempted to laugh, Kashmir is forgotten.

If the 'pressure of public opinion' has to be taken seriously, it cannot be subsumed in the 'manafacture of consent' provided by the

trivialisers of free speech in the mass media. Other forums and languages are needed through translation, songs, poems, pamphlets, documentaries, and hopefully, counter-films to *Roja*. The thrust of these alternative discourses could meaningfully cohere around a more detailed knowledge of the history of Kashmir since independence—a history that is being subtly suppressed. It could be argued, of course, that there is free access to information in a democratic society, but one can be equally sure that little or nothing will be done by the state or its allies to provide a more complete picture of all the complicated, fractious, and violent details of history that are best ignored 'in the national interest'.

The right to know the history of Kashmir beyond crude associations with 'terrorism' needs to be demanded and actively pursued by all citizen groups and public forums in India concerned with the protection of democracy. It is shocking indeed to realise not only how little we know, but how we accept this fact. A more detailed awareness of Kashmir (and not just the 'Kashmir problem') can begin only if we are prepared to counter our somnolence by consciously seeking out relevant facts and new strategies of intervention: the limits and possibilities of regional autonomy in Kashmir in the context of the abortive attempts in the past to negotiate and then deny this autonomy; the need to respect 'Kashmiri' identity as a complex of cultural and ethnic strains without equating it with 'Muslim' fundamentalism; the capacities of a democratic state to tolerate, as Balraj Puri puts it so bravely, "non-terrorist and peaceful expression of secessionist ideas".[12]

Dissent cannot be summarily equated with anti-nationalism. It needs to be contextualised within the specific histories of pain shared by different communities in Kashmir and addressed not with token concessions and gestures of sympathy, but concrete political measures. Nor can dissent be denied on the grounds that only a 'unified' (read: government) stand can prevent Kashmir from erupting into a 'thousand Bosnias'. More critically, dissent should not be equated with a tacit support for the aggressive internationalisation of the 'Kashmir problem' by Pakistan abetted by the US, whose policing of human rights is one of the most violent ironies in global politics today. The manipulative roles of Pakistan and America need to be confronted critically but not at the expense of addressing the very real estrangement of the people in the Kashmir valley from the rest of India. If Kashmir is an 'internal problem', then it is necessary to acknowledge the validity of dissent in negotiating differences not only in relation to 'militancy' but to certain constructs of the 'nation' in the country at large. The determination of the 'sovereignty of people' is not the prerogative of the state alone.

It would be presumptuous to assume that the 'Kashmir problem' can be resolved through cultural intervention. But considering the traumas that have emerged through the failed illusions, betrayals, wars, and collusions determined by a succession of political regimes, one could suggest the creation of a more humane ground for debate and dialogue through interactions between artists, writers, thinkers, and concerned citizens across the border(s). The 'responsibility of intellectuals' today is not to allow the exigencies of the *realpolitik* to destroy the possibilities of interaction with 'others' or to compromise on the freedom to think differently. By merely mounting or endorsing the categorical imperatives of the state, we are not protecting the 'national interest' but further contributing to a 'manafacture of consent' that needs to be disrupted. To acknowledge the democratic necessities of this disruption is, ironically, to risk being considered anti-national. But this risk is unavoidable today if we want to keep the struggles within democracy alive. It is not just the 'azadi' in Kashmir that is at stake, but the foundations of our own freedom as well.

I end this essay somewhat unexpectedly on an 'embrace'. This is how most romances are supposed to end and *Roja* is no exception. Sometimes in the closing shots of a commercial film, it is not just the lovers who embrace but their fathers as well. In *Roja*, the fathers are quite nondescript and absent, the state having usurped their roles. However, it would have been deeply moving to my mind—indeed, real tears could have been shed—if another embrace could have been realised: the embrace of Liaquat and Rishi Kumar. At an earlier point in time, this 'impossible' moment could have been realised through an 'unreal' narrative building to a rousing climax in which these estranged brothers could have embraced. But *Roja* is 'real' after all—so the final meeting between the 'patriot' and the 'terrorist' is perfunctory and falls flat.

Filling the void in the *realpolitik* beyond *Roja* is the embrace of politicians. Not the two leading negotiators of Kashmir within the home ministry whose tensions have resulted in a much-publicised 'cold war', but rather, two politicians from opposite camps—a 'liberal' veteran of the Hindu right and a tough-talking young Congressman. In their embrace, following the pyrrhic 'victory' of the Indian government at the recent talks in Geneva, both partymen grinning ecstatically at the camera (and 'us'), we confront the new complicities of our times: Congress-BJP bhai-bhai. This embrace would seem to contradict all the earlier dissensions between the defenders of the Sangh parivar and the upholders of a secular Indian state, between those politicians branded as 'deshdrohi' and the others claiming to be patriots. Where are the borders today in this dissolving of differences, this great show of 'unity'? What is being suppressed, denied, lied in this demonstration of loyalties? What is being celebrated? The 'national interest' or the collusions in 'the highest corridors of power'? The unnamed needs to be addressed.

Notes

[I would like to acknowledge the critical contributions and insights that I have received from Paneer Selvan, Sadanand Menon, Rajeev Bhargava, and Gautam Navlakha in the writing of this essay.]

2 T N Seshan's comment, "I unhesitatingly recommend this movie which should be seen by everyone", has been included in the hoardings of *Roja* as part of the advertising.

3 Fascism has yet to be rigorously defined within the contradictions of the Indian context, but in my use and questioning of the term in this essay, I am referring not only to extreme forms of authoritarian behaviour, but more specifically, to a hypernationalist endorsement of the power and legitimacy of the state in controlling the thoughts and lives of people through mechanisms of propaganda and violence.

10 As documented in *The Image Trap*, the facts of MGR's regime are deeply disturbing: a 11-year authoritarian rule determined by the most ruthlessly engineered corruption spearheaded by liquor barons, real-estate magnates, ruling party politicians, and implemented by a police machinery responsible for annihilating the 'mildest forms of dissent' through terror tactics resulting in jail deaths, illegal detention of innocent people, and a general intolerance for civil liberties. Ironically, even the most 'humanitarian', people-oriented programmes such as the Nutritious Meal Programme set up in the memory of MGR's mother ('Till my last breath, I will work for the people so that no mother in Tamil Nadu suffers the way my mother did') were actually financed by the poor themselves through tax revenue which ultimately facilitated "calculated political investments".

16 *Roja* opens up the politics of casting which was a non-issue in Indian cinema till very recently. Earlier, in the late 50s and 60s, for instance, villains were type-cast. There was an unquestioned convention in relating a particular actor to the 'role' of the villain which had nothing to do with his or her religious or political affiliations in real life. This was possible because communities, for the most part, were not marked in Indian cinema on the basis of religion. Rather, there was a constant spillage between cultural, religious, and fictional identities.

Today, however, we are beginning to confront new modes of differentiating actors both on screen and off. Their political affiliations can no longer be taken for granted; their links to the underworld and political parties are more 'real' than ever before. While at one time the fictionalisation of screen identities transcended the specific loyalties of an actor to a particular religion, creed, or party, the 'private' and the 'public' are more blurred today, as communal realities have entered the fictional frames and disrupted earlier, more 'innocent' (or perhaps, more complacent) modes of seeing.

17 The bilingual possibilities of *Roja* are implicit in the narrative insofar as it brings together people from Tamil Nadu/'the south' and Kashmir/'the north'. Unfortunately, Mani Ratnam frustrates these possibilities through his commitment to a predominantly monolingual accessibility. The real politics of the language in the film has been determined by its dubbing from Tamil into Hindi, which has proved to be so lucrative that yet another jingoist Tamil film, *I Love India*, featuring an army officer fighting Kashmiri terrorists, is going to be dubbed into Hindi.

The other political dimension of language in *Roja* is its uncritical, even 'positive' use of the English language (which, of course, remains the same in both the Hindi and Tamil versions of the film). From the sweet banalities of 'I love you' to the more 'professional' use of the word 'cryptologist', *Roja* reveals its openness to 'westernisation' which is part of its projection of 'development' in India.

18 Minu Jain, 'One for the Little Guy', *Sunday*, February 25-March 5, 1994, p 53.

19 A more detailed analysis of Mani Ratnam's cinematography could reveal how his most memorable sequences, notably the song picturisation of *Chhoti si Aasha*, are steeped in the formulae of picturesque, seductive advertising. He is assisted in this respect by his music director, A R Rahman, whose catchy and cute tunes with teeny-bopper rhythms are a skilful extension of his considerable experience in composing advertising jingles.

20 This description of the 'authoritarian Indian' is from Ashis Nandy's shrewd analysis of 'Adorno In India: Revisiting Psychology of Fascism', included in *At the Edge of Psychology*, Oxford University Press, New Delhi, pp 99-111.

32 Balraj Puri, op cit, p 74. This is a deeply lucid and responsible reflection on the history of Kashmir that needs to be widely read and discussed particularly in the context of negotiating 'regional autonomy'.

REVIEW ARTICLE

From Metaphysical to Political: John Rawls' Revised Version of Libe

Prakash Sarangi

Political Liberalism by John Rawls; Columbia University Press, New York, 1993.

I

JOHN RAWLS' *Political Liberalism* (1993)* is an important landmark in contemporary liberal theory. It is a continuation of his earlier work *A Theory of Justice* (1971), which was written in an era of decline of political philosophy and which has made him almost a celebrity. His ideas on justice have been powerful, subtle and wide-ranging. Nozick's prediction that political philosophers would have to "either work within Rawls' theory or explain why not" has indeed come true [Nozick 1974: 183]. Rawls' ideas have been assessed not only by political and moral theorists, but also by economists, jurists, sociologists, international relations scholars and lay critics. The responses are not confined to the western world; he is read and discussed in almost every country. However, no critic has agreed with Rawlsian ideas *in toto*. He has been criticised both by liberals and libertarians, by conservatives and Marxists. Since 1978, Rawls has been writing off and on and has been giving occasional lectures primarily as replies to critics. In the process, he has revised and systematised his notion of 'justice as fairness'. The result of this enterprise is his latest book, *Political Liberalism*. It is more than a compilation of his earlier writings (1978, 1980, 1982a, 1982b, 1985, 1987, 1988, 1989). He has revised those papers considerably, added an unpublished paper, 'The Idea of Public Reason', and has presented an introductory chapter which lucidly knits together his idea of political liberalism.

The aims of *A Theory of Justice* were to generalise and to carry to a higher order of abstraction the doctrine of social contract as an alternative to the moral theories of utilitarianism and rational intuitionism (1971: vii-viii). Justice as fairness was the chief structural feature of this conception. The social contract tradition was seen by Rawls as part of moral philosophy. A moral doctrine of justice which is supposed to be general in scope was not distinguished from a strictly political conception of justice. However, Rawls' attempt to present a universal moral theory led to several logical inconsistencies. Justice as fairness was framed to accord with the idea of a 'well-ordered society'. A well-ordered society was supposed to be regulated by a public conception of justice. It is a society in "everyone accepts and knows that s accept the same principles of justice, and the basic social institutions satisfy and are known to satisfy these principles" (1971: 454). Such a society is relatively homogeneous in its basic moral beliefs and there is broad agreement about what constitutes the good life. Since a well-ordered society endures over time, its conception of justice is supposed to be stable, i e, when institutions are just, as defined by the conception of justice, those taking part in these arrangements acquire the corresponding sense of justice and desire to do their part in maintaining them.

Such stability provided a basis for Rawls to argue that justice as fairness was a comprehensive philosophical doctrine. But Rawls faced a problem because the idea of a well-ordered society of justice as fairness is not only unrealistic but is also incompatible with the fact of reasonable pluralism. In his new book, he sets the tone of this argument thus:

> A modern democratic society is characterised not simply by a pluralism of comprehensive religious, philosophical, and moral doctrines but by a pluralism of incompatible yet reasonable comprehensive doctrines. No one of these doctrines is affirmed by citizens generally. Nor should one expect that in the foreseeable future one of them, or some other reasonable doctrine, will ever be affirmed by all, or nearly all, citizens. Political liberalism assumes that, for political purposes, a plurality of reasonable yet incompatible comprehensive doctrines is the normal result of the exercise of human reason within the framework of the free institutions of a constitutional democratic regime. Political liberalism also supposes that a reasonable comprehensive doctrine does not reject the essentials of a democratic regime (1993: xvi).

Now, instead of looking for a comprehensive moral doctrine, Rawls attempts to present a political conception of justice. This justice is the focus of an overlapping consensus of reasonable comprehensive doctrines. Justice as fairness is now presented as an example of such a political conception. Being the focus of an overlapping consensus, it can be endorsed by the main religious, philosophical and moral doctrines that endure over time in a well-ordered society. it is the most likely basis of social unity available in a constitutional democratic regime. Were it achieved, Rawls believes, it would extend and complete the movement of thought that began three centuries ago with the gradual acceptance of the principle of toleration. This process would end with the full acceptance and understanding of modern liberties.

The problems of contemporary political life do not centre around simply the issue of religious toleration but extend to diverse issues based on race, ethnicity, gender, etc. This calls for a different set of principles of justice which *A Theory of Justice* did not discuss. Rawls is aware of this. The earlier version of liberalism was intrinsically faulty because it relied on abstract concept of the person and used individualist, non-social idea of human nature. It employed an unworkable distinction between the public and the private that rendered it unable to deal with the problems of gender and family. It is because of these problems that Rawls sets out to present his notion of justice as fairness as a form of political liberalism. He seems to argue that it is possible to delinate the fair terms of social co-operation between citizens characterised as free and equal yet divided by profound doctrinal conflicts. This is a problem of political justice and not a problem about the highest good. The general problems of moral philosophy are not the concern of political liberalism, except insofar as they affect the way the background culture and its comprehensive doctrines tend to support a constitutional democratic regime.

Thus Rawls' *Political Liberalism* raises two fundamental questions about political justice in a democratic society: What is the most appropriate conception of justice for specifying the fair terms of social co-operation between citizens regarded as free and equal, and as fully co-operating members of society over a complete life, from one generation to the next? What are the grounds of toleration, given the fact that the political culture of a democratic society is always marked by a diversity of opposing an Irreconcilable religious, philosophical and moral doctrines? Rawls finds it remarkable that in spite of the deeply opposed views in almost every democratic country, there could be a possibility of obtaining just co-operation among free and equal citizens. He thinks that political liberalism could provide a solution to this intractable problem.

An important reason for the conflict in a constitutional democracy is the deeply contested ideas about how the values of liberty and equality are best expressed in the basic rights of citizens so as to answer to the claims

of both liberty and equality. Rawls thinks that his idea of justice as fairness tries to adjudicate between the two contending values. He attempts to show that a certain arrangement of basic political and social institutions is more appropriate to realising both the values of liberty and equality when the citizens are conceived as free and equal.

One has to start by looking to the public culture as the shared fund of implicitly recognised basic ideas and principles. The sharing of such convictions emerges out of the historical experiences of citizens. Giving examples from the American society, Rawls says that religious toleration is now accepted and no one openly professes an argument for persecution. Similarly, slavery which caused a civil war is now rejected as inherently unjust and no one would defend it as a social policy. "We collect such settled convictions as the belief in religious toleration and the rejection of slavery and try to organise the basic ideas and principles implicit in these convictions into a coherent conception of justice. These convictions are provisional fixed points that it seems any reasonable conception must account for" (1993: 8). Such considered convictions which are also described as 'reflective equilibrium' become the basis of the political conception of justice. The aim of justice as fairness is to present itself as a conception that may be shared by citizens as a basis of a reasoned, informed, and willing political agreement. It expresses their shared and public political reason.

A political conception of justice is presented as, what Rawls calls, a 'freestanding view'. It offers no specific metaphysical or epistemological doctrine beyond what is implied by the political conception itself. It is assumed that all citizens would affirm their own comprehensive doctrines, to which the political conception they accept is in some way related. But the latter is not a part of or derivable from any comprehensive doctrine. Rawls explains this by using a contemporary phrase: "[T]he political conception is a module, an essential constituent part, that fits into or can be supported by various reasonable and comprehensive doctrines that endure in the society regulated by it. This means that it can be presented without saying, or knowing, or hazarding a conjecture about [the] doctrine it may belong to, or be supported by" (1993: 12-13). Thus a freestanding political conception does not deny there being other values; nor does it say that political values are separate from other values. Rawls' aim seems to specify the political domain and its conception of justice in such a way that its institutions can gain the support of an overlapping consensus.

Citizens who affirm reasonable but opposing comprehensive doctrines belong to an overlapping consensus, i e, they generally endorse that conception of justice which endorses the content of their political judgment of basic institutions. The object of consensus is itself a moral conception. It is affirmed on moral grounds. It includes conceptions of society and of citizens as persons, as well as of principles of justice, and an account of the political virtues through which those principles are embodied in human character and expressed in public life. An overlapping consensus, therefore, "is not merely a consensus on accepting certain authorities, or on complying with certain institutional arrangements, founded on a convergence of self- or group-interests" (1993:147). All those who affirm the political conception start from within their comprehensive view and draw on religious, philosophical and moral grounds it provides. They will not withdraw their support of it should the relative strength of their view in society increase and eventually become dominant. Thus overlapping consensus is supposed to be stable in spite of the shifts in the distribution of political power. Hence Rawls excludes the possibility of the creation of a political community united by the affirmation of the same political doctrine. The moral quality of public life is achieved because the citizens share a common aim rather than by the oppressive use of state power.

This notion of the exercise of power by the people was missing in the earlier writings of Rawls [Sarangi 1991]. In *Political Liberalism*, he introduces the idea of 'public reason' as the basis of the liberal legitimacy of the state. He describes it as the intellectual and moral power of the citizens, though limited to constitutional essentials and questions of basic justice: "...in a democratic society public reason is the reason of equal citizens who, in a collective body, exercise final political and coercive power over one another in enacting laws and in amending their constitution" (1993:214). Public reason imposes a limitation on the exercise of coercive political authority over the most fundamental values of the polity. Citizens share in political power as free and equal persons, and being reasonable and rational they have a duty of civility to appeal to public reason. They are to "conduct their fundamental discussions within the framework of what each regards as a political conception of justice based on the values that the others can reasonably be expected to endorse and each is, in good faith, prepared to defend that conception so understood" (1993: 226). This means that each one of us must have, and be ready to explain a criterion of what principles and guidelines we think other citizens (who are free and equal) may reasonably be expected to endorse along with us. It is inevitable and often desirable that citizens have different views as to the most appropriate political conception because the public political culture is bound to contain different fundamental ideas that can be developed in different ways. Thus an ideal of public reason is an appropriate complement of a constitutional democratic culture which is marked by a plurality of reasonable comprehensive doctrines.

Rawls' interest in the political conception of justice leads him to emphasise on the role of a citizen in a democratic state rather than on the abstract individual. However, his procedure for achieving social co-operation is the same as before: citizens are viewed as persons who can engage in social co-operation over complete life. They can adjust their ends so that those ends can be pursued by the means they can reasonably expect to acquire in return for what they can reasonably expect to contribute. The idea of responsibility for ends is implicit in the public political culture. Instead of a metaphysical doctrine of persons, Rawls presents a conception of persons as political beings. These citizens are represented in the original position as free and equal. They think of themselves as free in three respects: first, as having a moral power to form, to revise, and rationally to pursue a conception of the good; second, as being self-authenticating sources of valid claims; and third, as capable of taking responsibility for their ends (1993:72). Being free in these respects enables citizens to be both rationally and fully autonomous. Rational autonomy rests on persons' intellectual and moral powers. It enables them to deliberate in accordance with their conception of the good. It is in their public recognition and the informed application of the principles of justice in their political life, as their effective sense of justice directs, that citizens achieve full autonomy. As stated by Rawls: "[F]ull autonomy... is a political and not an ethical value. By that I mean that it is realised in public life by affirming the political principles of justice and enjoying the protections of the basic rights and liberties; it is also realised by participating in society's public affairs and sharing in its collective self-determination over time" (1993: 77-78).

II

On the whole, Rawls now asserts that justice as fairness is a *political* conception and not a metaphysical one. However, he seems to be attaching several meanings to the term 'political conception of justice'. Such a conception is directed towards the basic structure of society rather than toward a full range of moral conduct. It therefore accepts a sharp distinction between public and non-public principles. At the same time, it is a moral notion because it rests on the possibility of conscientious public action and not on pure Hobbesian appeal to rational self-interest. Further, a political conception is constrained by the requirements of practicality. It is based on the facts of political history and social development. It is drawn from and addressed to a specific public culture. Its justification lies in sharing the understanding of that culture rather than its correspondence to some universe of moral facts. Also, it is supposed to be independent of the broad philosophical, metaphysical and religious commitments.

It is not clear whether Rawls' revision of his conception of justice adequately counters the critique of communitarians [e g, Sandel 1982]

that his conception of the self is self-created and freely chosen as opposed to the constitutive conception of the self in which it is history and circumstances that constitute individual identities. Rawls' strategy seems to deny that liberalism rests on any specific conception of individuality. One enters the original position not by denying one's unique self-hood, but by blacking out the knowledge of social position which might be morally arbitrary. The veil of ignorance, therefore, has "no specific metaphysical implications concerning the nature of the self; it does not imply that the self is ontologically prior to the facts about persons that the parties are excluded from knowing" (1993:27).

One may object to Rawls' arguments on several grounds. It is one thing to say that liberalism does not presuppose a single metaphysical view of the individual, but quite another to say that liberalism is compatible with all such views. Rawls seems to depend on the latter claim which cannot be easily sustained [Gutmann 1985]. Secondly, Rawls' argument depends on a specific affirmative conception of individuality: persons must be emotionally, intellectually and ontologically capable of drawing an effective line between their public and non-public identities. This may defeat the very purpose of anonymity associated with the idea of a veil of ignorance. Thirdly, conflict within liberal societies may force metaphysical issues onto the public agenda. Consider the issue of non-discrimination. It raises the question as to who is to be treated as an equal member of moral community. Public authority may be used to defend equal rights of all moral persons. Yet, doing this in circumstances of deep moral disagreement risks discord and even violence.

At the same time, Rawls' revised version of liberalism does not rest on the unencumbered self. He seems to be convinced that individuality is not only shaped but also threatened by the community. He expects individuals to be endowed with the capacity for critical reflection on the institutions and presuppositions of their society as also for non-coerced choice essential to moral action. "To have the capacity to become aware of the inner contradictions of one's own society is precisely the kind of reflective distance required by the liberal conceptions of individuality. . liberal theory needs no more; and the communitarian critics of liberalism cannot in the last analysis deny its possibility" [Galston 1989: 722].

Rawls has narrowed down his conception of political philosophy by addressing to a specific public culture, that of democratic society. Earlier, *A Theory of Justice* was applauded partly because it was seen as restoring the legitimacy of truth-based political evaluations. He contended at that time that his theory was neither produced by specific historical and social circumstances nor ...... to defend any existing order. He has subsequently abandoned this effort. Political philosophy, he now contends, is always addressed to a specific public culture. It proposes principles congenial to specific historical traditions. Justice as fairness presents itself "not as a conception of justice that is true, but one that can serve as a basis of informed and willing political agreement. ...Philosophy as the search for truth about an independent metaphysical and moral order cannot, I believe, provide a workable and shared basis for a political conception of justice in a democratic society" (1985:230).

It seems that the Rawlsian idea of moral personality is the predominant self-understanding held by contemporary citizens of liberal democratic societies. Rawls, like Hegel, has transposed the Kantian idea of the free and equal moral personality from the realm of transcendental reason to the realm of history. However, in the absence of some sort of philosophy of history, there is no obvious reason to accord moral significance to the subjective beliefs about moral personality held by contemporary liberal citizens. "One needs to moralise history if one is going to develop a moral theory of justice out of historical circumstance. Otherwise, the moral character of the political interpretation of justice as fairness is left unexplained and ungrounded" [Neal 1990:47].

Rawls has to clarify as to how the existence of an overlapping consensus on a conception of justice can be empirically ascertained and whether the presentation of a political conception is the best way to gain sufficient consensus for stable unity. He seems to be satisfied with merely imaginatively realisable consensus on a principle of justice. He even goes on to justify this utopianism: "[P]olitical philosophy assumes the role Kant gave to philosophy generally: the defence of reasonable faith in the possibility of just constitutional regime" (1993: 172). Whether such a reasonable faith can remain divorced from metaphysical implications of political philosophy is not certain.

Although Rawls' political conception of justice is not defined in opposition to moral, he nevertheless wants it to be understood as something not founded on a comprehensive moral ideal. He wants to maintain a balance between the Hobbesian strand of liberalism—liberalism as a *modus vivendi* secured by a convergence of self and group interests—and a liberalism founded on a comprehensive moral doctrine such as that of Kant and Mill. Perhaps he fears that a Hobbesian reading of the political would fail to provide a sufficiently moral account of the citizens' obligation to accept and obey the institutional practices which would result from the original position. At the same time, he does not want his conception of justice to be premised on a comprehensive moral ideal of individual character, because in that case it would fail to qualify as a non-controversial conception of a procedure capable of adjudicating conflict among moral ideals.

It goes to the credit of Rawls that he seems to have found a way of solving what might be called a paradox of liberalism. On the one hand, liberalism is committed to tolerance. Hence, state has to remain neutral in the conflict of ideas among citizens. On the other hand, liberalism also demands partiality for itself. It requires that force be used against the individuals challenging the principle of tolerance. "Rawls' justification of a political conception as part of an overlapping consensus allows him to argue, on everyone's behalf, that the substantive conception of justice included within it is right (and worthy of enforcement through state power) even while remaining tolerant of (and impaired towards) the disparate ideas, life-styles, religions, and moral views of the citizenry" [Hampton 1989: 803]. Now it is clear why Rawls says that formulating a political conception of justice is simply applying the principle of toleration to philosophy itself. It is worth pondering over the idea that political philosophy is useful to a liberal society only if it rids itself of all metaphysical views so as to be properly tolerant of the diversity of ideas and practices in a country's political culture.

Regional Variation in Demographic Consequences of Famines in Late 19th and Early 20th Century India

Arup Maharatna

India provides a good opportunity for analysing famine demography from a historical perspective. While analysis at an aggregate level provides an understanding of short-term demographic responses, analysis of inter-district variations helps to assess the relative importance of factors such as drought severity, relief provision, flow of migration, etc, that shaped the demographic outcome.

WHILE demographic considerations are central to an understanding of famine[1] this aspect appears to be a relatively less researched area.[2] However, there have been some serious attempts, in recent times towards providing useful insights on famine demography.[3] In this context India provides a good opportunity of analysing famine demography from a historical perspective.[4] Tim Dyson in a recent study has exploited this opportunity by analysing demography of India's four major historical famines, namely, those of 1876-78, 1896-97, 1899-1900 and 1943-44.[5] In Dyson's study, however, the analysis is at an aggregate provincial level. While this provides an understanding of short-term aggregate demographic responses during the famine process, the question of spatial variation has not been addressed at all in Dyson's study. But examination of regional variation within a province should also provide insights into the factors which contribute to demographic consequences. This is because in major famines not all areas were similarly afflicted in terms of excess deaths. So inter-district analysis should help assess the relative importance of factors (e g, drought severity, and relief provision) that shaped the demographic outcomes.

Of course, the question of regional variation is potentially far more complex than an aggregate province-level analysis. Indeed, a comprehensive study of spatial variation in demographic consequences might involve many complex forces (e g, economic conditions, regional ecology, variation of infrastructure, and different patterns of relief). Thus a region with a relatively large proportion of irrigated land can be expected to cope better with a drought than a solely rainfall dependent region. However, given the existence of transport and communications network, trading and speculative activities may tend to spread dearth and high food prices across all regions—irrigated or unirrigated. This, in the context of an integrated market, a region with little loss of farm activities and employment may still experience a rise in food prices and associated distress, while a drought-affected region suffers both from employment (hence income) loss and price rise. From these considerations it may be hypothesised that regional variation in price rises actually may be a poor indicator of regional variation in famine distress (especially where a transport network is fairly developed). Furthermore, variation in the demographic impact of a famine may also involve factors such as migration, relief provision, and epidemics. Thus a significant flow of migration from one region to another, other things equal, will inflate the number of registered deaths in a receiving area and vice versa. Regional patterns of relief may also influence demographic consequences. A better provision of relief in one area may be hypothesised to mean less distress and less associated excess mortality.

The purpose of the present paper is to examine some of these issues using district-level data for selected major famine locations in the Indian subcontinent. These are the Bombay famines of 1876-78 and 1896-97, the Punjab famine of 1899-1900 and the United Provinces of Agra and Oudh (called United Provinces henceforth) famine of 1907-08.[6] All these famines were 'major' both in the sense of 'severity' of distress and its spread across wide areas of the Indian subcontinent.[7] The selection of these locations has largely been influenced by the availability of a relatively good quality data and other official documents. The primary source of district-level demographic data is the registration system.[8] There is no doubt that registration coverage was far from complete. This problem was particularly pronounced during the early days of the registration system. However, it should also be noted that there has been a significant provincial variation in quality of registration. For example, the registration system was relatively good in Central Provinces, Berar, Bombay Presidency, Punjab and United Provinces.[9]

During periods of social disruption such as accompanied by famine, it is possible that quality of registration sometimes deteriorated. But this was not necessarily the case. Famine conditions often led to augmented registration efforts.[10] While there might have been regional differences in registration quality this problem should not prevent one from using registration data for the purpose of assessing changes during the famine process from the pre-famine levels. Even if there was a deterioration in registration coverage during famines, assessing inter-district variation in demographic impact should not be difficult, provided all districts suffered somewhat uniformly in terms of deterioration in registration operations. The principal sources of information on non-demographic variables (e g, regional variation in drought, crop failure, price rises, and relief) are the annual provincial administration reports and separate provincial (often very voluminous) reports on famine administration.

Few more general points are worth noting here. First, the single most important precipitating factor in all these famines was drought. Thus the events associated with different stages of famine (i e, early signs, peak of the crisis and tapering off) were somewhat common to all these famines.[11] The onset of drought (around early July) immediately triggered food prices, and this together with the loss of farm employment resulting from a very low agricultural production (of both kharif and rabi crops), contributed to a drastic entitlement failure for the majority of rural population. Migration in search of food or employment was a

common response. Famine distress in the forms of starvation and acute undernutrition usually tended to peak over the period until the resumption of monsoon in the year following drought.

Second, the chief governmental effort to tackle famine consisted of relief provision for the most vulnerable sections. There was no governmental control over prices, supplies and distribution of food, which were basically left to market forces and private traders.[12] Organisation of relief policy was the responsibility of the local-level administration.[13] For example, a district was entitled to government relief provision only after local-level administrators had declared the existence of famine conditions. Accordingly, in the provincial reports on the famine administration districts have, almost always, been classified into 'famine districts' and 'non-famine districts'. Official declaration of famine in a locality was usually based on some 'tests'. For example, 'test works' (i e, provision of paid works on a very small scale) were set up initially to test whether or not the provision of large-scale relief work in that locality was justified.

Relief measures were in two basic forms: direct and indirect. The most important measure of relief was the provision of massive public works at subsistence wages (paid in cash) for those who came forward for it. Complementary to public works was gratuitous relief for those who were unable to work. Gratuitous relief usually took the form of either cash doles or cooked food in the relief kitchens also poor houses. Indirect relief measures usually included remissions from land revenue, and agricultural loans for both subsistence and production.

Bombay Famine of 1876-78

The Bombay presidency, or at least a large part of it, has traditionally been vulnerable to drought and famine. This is, of course, related to the scanty and uneven nature of monsoon rainfall in this vast and largely unirrigated land. The proportion of irrigated land to the total under cultivation has always been less than 5 per cent.[14] However, all regions were not equally vulnerable to drought. Table 1 provides some background on 23 districts, grouped into four divisions, under the British administration in the years immediately before the 1876-78 famine. Of the four divisions only Konkan normally received abundant rain. Both Deccan and Gujarat were usually the recipients of scanty rainfall and were thus relatively dry. However the districts of Sind division were the driest (Table 1).[15] However, Sind was not as vulnerable to drought-related famine as the Deccan. This was partly due to the fact that Sind division—being extremely dry—used to rely on the cultivation of dry crops like cotton, sugar-cane, and wheat. Also, agricultural production was largely based on the waters of the Indus river rather than on the monsoon rains.[16] Sind's relative prosperity and lesser vulnerability to drought was amply reflected in the fact of very high productivity of cotton cultivation, especially compared to the Deccan (Table 1). Gujarat division, though dry, was not always affected by a general monsoon failure as severely as was Deccan. This was partly because "the southern districts of Gujarat lie open to the sea (rather than shielded behind the Ghats)".[17]

The vital rates for 1874-75 in Table 1 clearly indicate that the registration data were deficient; and the level of underregistration was almost certainly *not* uniform across districts. Very low registered vital rates for the districts of Sind reflect the division's own special difficulties in establishing the registration system.[18] However, while we cannot attach much confidence to the levels of these vital rates, proportionate changes in registered deaths and births may still be used for inter-district comparisons. Of course, we do this under the assumption that both registration coverage and its inter-district differentials did not change significantly within the very short space of time involved. Note that both the Deccan and Gujarat divisions registered comparatively high death rates in 1874-75. Relatively lower registered death and birth rates in Konkan division may be indicative that registration coverage in this region was slightly less. However, Konkan being a region of abundant rainfall, this may also be partly a reflection of the fact that this region was relatively secure from famine.[19]

We now analyse regional variation in the demographic consequences of the 1876-77 famine. Table 2 provides key indices of drought, crop losses, price rises, mortality and fertility effects and also relief provisions across the districts of Bombay presidency. The officially declared famine districts (i e, the Deccan division)—which were the only ones provided with government relief—have been distinguished from the rest; and districts in both groups have

Notes: (1) Figures marked (*) are the respective unweighted averages of the district-level figures.
(2) There was almost no cotton cultivation in the Konkan division.

Sources: Rainfall and demographic data: *Annual Report of the Sanitary Commissioner for the Bombay Government*, Government Press, Bombay, various years; data on yields of cotton: *General Report on the Administration of the Bombay Presidency for the year 1875-76*, Government Press, Bombay, 1877.

been ranked separately (in descending order) with regard to the scale of mortality increase. It is clear from Table 2 that almost all of the Deccan region experienced a significant shortfall of rain in 1876 and hence much of the normally cultivated land had to remain uncultivated during 1876-77. Although shortfalls in both rain and land cultivation from pre-famine levels were not confined to the districts of the Deccan, it is apparent that such failures were relatively less in the other divisions. Indeed, some districts (e g, Sikarpur and Broach) even recorded a slight increase in the area under cultivation in 1876-77.[20] This difference between the Deccan and other regions was also reflected in food prices. The districts of the Deccan (i e, the 'famine districts') generally experienced higher price increases than other regions. This probably partly reflects the fact that markets were not very well integrated. This should be judged in the light of the available transport and communication facilities which were, though developing, still relatively poor during the late 1870s. Thus the implication is that famine distress (particularly as evinced by rising prices) could not spread uniformly across districts. Conditions of severe famine distress were relatively confined to areas which were most severely affected by crop failures.

While the number of registered deaths more than doubled in the 'famine districts', the 'non-famine' areas on average recorded a modest (if not entirely negligible) increase in mortality (Table 2). Similarly, the registered number of births in 1878—which can be taken as approximately indicative of the number of conceptions in the peak famine year of 1877—appears to have been reduced by about 50 per cent on average in the Deccan division; but all the other divisions, taken together, seem to have experienced no appreciable decline in births (Table 2). Thus considering these two groups of districts—famine and non-famine—we find a clear correspondence between their presumed economic and demographic vulnerability.

Table 3 presents correlation matrix for the relevant measures. It shows that correlations of index of land cultivation with indices of rainfall failure and price rises are respectively positive and negative—both being statistically significant and in expected directions. This implies that failures of the rains played a distinct part in determining failures of agriculture and hence price increases. As also can be seen from Table 3, the correlations of the index of births with the index of land cultivation and price are of the expected signs and also statistically significant. Note, however, that the relationship between the index of mortality and the index of land cultivation is much stronger (-0.72) than with the relationship with index of price (0.32). There may be a suggestion here that the extent of production failure is a better measure of distress than price rises *per se*. Note too that the reduction in births corresponds better with regional variation in the measures of distress. Moreover, the correlation coefficient between the indices of deaths and births is negative (as expected) and also statistically quite significant. However, there are some notable irregularities to these generalisations at the district level. For example, some non-famine districts (e g, Thar and Parkar, and Kanara) experienced very large increases in mortality—even larger than some famine districts. As mentioned earlier, the division of districts into 'famine' and 'non-famine' was based on assessments made by district officials. However, such a sharp official distinction did not conform strictly to the real regional varia-

Index of price in 1876-77			0.32	-0.58*
Index of deaths in 1877				-0.84*

Note: Data on changes in births and deaths for Thar and Parkar were excluded because of unduly extreme influences (see Table 2).
* Less than 1 per cent level of significance.

tion of distress. For example, Kanara which seems to have received less than half the normal rainfall in 1876 may well have suffered great food shortage and distress. Certainly it seems to have experienced both considerable mortality increase and fertility reduction (Table 2). **But Kanara was not officially recognised as a famine-affected district and was not provided with relief. Thus the case of Kanara may be an example of administrative failure in the identification and classification of districts.** However, the administration report for 1877-78 stated that: "The district of Kanara, without being affected by scarcity, became the resort of numerous immigrants from the famine country, who, being unaccustomed to the climate of the thickly-wooded coast and hill tracts, fell victims to fever and other diseases on their arrival".[21]

On the other hand, unlike Kanara, mortality increases in much of Sind division (e g, in Thar and Parkar, Kurrachee and Hyderabad) were not generally matched by signs of fertility reduction. Indeed, the fact that the registered number of deaths and births in Thar and Parkar both more than doubled is striking (Table 2). As indicated earlier, the registration system, particularly in Sind, was extremely deficient. Apropos the enormous rise in registered births in Thar and Parkar in 1877 compared with the preceding year, the *Administration Report* writes that "no explanation of this increase has been given, but under the present system the registration of births and deaths cannot but be unsatisfactory".[22] In any case, an increase in the registered number of deaths (perhaps combined with an increased or constant number of registered births) in a less affected area may also be consistent with in-migration of famine victims.

This is probably best illustrated by the indices of registered deaths and births for Bombay in Table 2. The city recorded a considerable increase in mortality in 1877 with presumably no drop in the number of conceptions. In this context the *Administration Report* states that "The year [1877] has been an exceptionally unhealthy one, and there was a large influx of labourers from the coast and Deccan, amongst whom fever was both prevalent and fatal to an extraordinary degree. The total number of immigrants cannot be exactly stated, but during the six weeks that registration was carried on, it amounted to 36,258."[23] Note from Table 2 that in 1872 the population of Bombay city was only 6,44,405. So the volume of immigration was comparatively large. Note too from the foregoing quotation the perceptive linking of migration and mortality from 'fever'.

Relief operations may also exert an important influence on regional pattern of demographic consequences Table 2 suggests that relief provision was relatively great in those famine districts which experienced comparatively large reductions in cultivated area (presumably reflecting greater crop losses). The estimated correlation coefficient between the index of land cultivated and the measure of relief is negative and **very high (-0.95). In other words, relief operations appear to have been quite well targeted.**

However, the impact that variation in the distribution of relief made on regional variation of mortality and fertility is not easy to judge simply by looking at the relevant district-level data in Table 2. Shalapur—experiencing severe drought and a large increase in mortality—received the largest relief provision. Nearly equal relief provision in another most severely affected district, namely, Bijapur—which also recorded the largest mortality increase—may be suggestive that although relief was generally targeted in accordance with the severity of distress, it was not very successful in preventing demographic crisis. This, in fact, may imply several things (which are not necessarily mutually exclusive), such as the untimeliness, inadequacy, or excessive harshness of the relief measures which were provided. It is also possible that the allocation of large relief provisions to one area drew in victims from adjoining localities, and thus provoked epidemics and inflated the number of deaths in the receiving districts. But in turn this explanation implies inadequate relief provision in those areas **from where people migrated. All this probably reflects both the inadequate and harsh nature of the relief provision. Proportion of gratuitous relief was indeed very small** (Table 2).[24]

While the question of what would have happened to mortality without relief remains open, the district-level data on relief and mortality effects indicate that relief

policy was deficient in mitigating the great vulnerability in the most severely affected areas. Indeed, the scatter plot between the index of mortality and measure of relief (based on Table 2) suggests a positive relation, the estimated correlation coefficient being 0.61. Thus, while allocation of relief provision was broadly directed towards the severely affected districts, it does not appear to have been able to break the positive association between the severity of famine and extent of mortality rise.

Bombay Famine of 1896-97

The famine of 1896-97 in Bombay presidency "resulted less from the total insufficiency of the rainfall than from its unreasonable distribution".[25] Table 4 presents district-level data on crop failure, relief, and mortality and fertility.[26] Famine was officially declared in nine districts of the Bombay Presidency. Note that as in the famine of 1876-78 the districts of the Deccan were only declared as famine affected. Relief provisions were also organised only for those nine districts. From Table 4 it appears that the famine-declared districts experienced considerable reductions in agricultural productivity in 1896-97. The remaining districts also seem to have experienced shortfalls in productivity, but generally to a lesser extent. Average prices in 1896-97 more than doubled in most of the affected districts. Although data on prices for the non-famine districts were not provided in the Famine Commission Report, the "tendency of equality of prices in famine and non-famine tracts" has been a very common feature of Indian famines especially in the late 19th century when transport reached a higher level of development.[27] Thus Khandesh, which appears to have recorded the highest price rise, does not seem to have suffered most either in terms of productivity or mortality.

Proportional rises in mortality during the famine of 1896-97 were distinctly less than in the famine of 1876-78. The range of variation in mortality increase too appears to have been less in the famine of 1896-97 (compare Tables 2 and 4). As can be seen, some of the 'non-famine' districts seem to have experienced significant mortality increases compared to some 'famine' districts. In fact, the correlation coefficient between district-level indices of crop failure and mortality increase, though positive, is somewhat lower than in the famine of two decades before (compare Tables 3 and 5). Thus, the suggestion from the data that mortality increases were less confined to the famine-declared areas (compared to the events of 1876-78) probably also reflects greater market integration. This is consistent with the increased development of transport networks (especially railways) during the last few decades of the 19th century.

Note too that the association between the extent of crop failure and reduction in births during this famine seems to have also been lower than in the preceding crisis. The suggestion is that perhaps owing to both increasing transport networks and market integration over time, famine distress and its adverse demographic consequences became less restricted to drought-affected areas.

The apparent improvement in registered mortality in districts such as Broach, Ahmedabad, Panch Mahals and Kaira is notable. These four districts also appear to have experienced an increase in registered births. However, the correlation coefficient between the indices of births and deaths is negative—as expected—and also quite high (Table 5). Note that the reduction in conceptions in most of the affected districts from their respective pre-famine levels appears to have been considerably less in the famine of 1896-97 (compared to that of 1876-78).

As Table 4 shows the number of persons on relief in many of the affected districts in 1896-97 appears to have been lower than in 1876-78. This may partly reflect the reduced pressure on relief works because of relatively liberal policy of giving loans and

Sources: (1) Columns (2), (5) and (6): *Report on the Sanitary Administration of the Punjab*, Government Press, Lahore, various years; columns (3), (4): Based on Government of Punjab, *Report on Administration of the Punjab and Its Dependencies*, Government Press, Lahore, various years.

advances to landholders who created a considerable amount of employment.[28] In terms of crop failure Shalapur and Bijapur appear to have been the most severely affected districts; and they also received relatively large provision of relief. In fact, the regional distribution of relief provision in 1896-97 (as far as it can be assessed) appears to have corresponded fairly closely to regional variation in severity of famine.[29]

It is notable that as a proportion of total relief the share of gratuitous relief in most districts seems to have been larger during 1896-97 than in 1876-78 (Tables 2 and 4). As Bhatia states in connection with the Bombay famine of 1896-97, "[i]n the treatment of the children and dependents of relief workers in kitchens, maintained at relief works, a high degree of success was obtained in Bombay. The administration of village gratuitous relief was 'on the whole carried out with success' ".[30] Measures were also taken to protect sanitary condition particularly at the relief camps.[31] Thus a comparative moderation in the scale of overall mortality and, perhaps, its reduced variation between districts during this famine can reasonably be attributed, in part, to better provision of relief. For example, the relatively moderate mortality increase in the severely affected district of Shalapur (compared with some less affected areas) may partly be due to the favourable effects of the largest provision of relief there (Table 4). That relief provision during the famine was somewhat better (compared with the famine of 1870s) seems to find support too from the absence of a positive relationship between district-level relief provision and mortality increase, correlation coefficient being -0.06.

Punjab Famine of 1899-1900

Under the British administration Punjab was a vast territory (1,10,463 square miles), consisting of 31 districts which were divided between six administrative divisions.[32] Table 6 presents demographic and other background information for all the districts and divisions of Punjab. Note that the spatial distribution of monsoon rain appears to be very uneven across the regions. For example, Kangra district normally receives rains as high as 139 inches, whereas for Dera Ghazi Khan the figure is only about three inches. Even immediately adjacent districts can receive very different amounts of rain (e g, see Hazara and Peshwar). Yet despite

inter-district differences, the divisional averages suggest a relative paucity of rainfall across most of Punjab.

However, Punjab is known to have had an advantage historically over most other provinces in terms of irrigation facilities. Several districts with low rainfall enjoyed relatively large proportions of irrigated land, and hence they were comparatively less dependent on the monsoon (e g, the districts of Lahore division). But the districts of Delhi division appear to be particularly vulnerable, since they were neither recipients of good normal rainfall, nor were they provided with significant irrigation. Obviously, therefore, this region should be relatively susceptible to famine conditions. In this respect Hissar stands out as the most vulnerable district (Table 6). However, many other districts, including some outside of Delhi division, were also susceptible. Yet because of the comparatively extensive irrigation facilities in the province, drought may be expected to have affected agricultural production less uniformly across the districts of Punjab, compared to other provinces (say Bombay) where irrigation was much more rare.

Registration data do not show any distinct regional pattern of pre-famine levels of mortality and fertility. For most districts the birth rate was considerably higher than the death rate. However, variation in death rates across districts seems to have been larger than for the birth rate; the coefficients of variation are respectively 0.22 and 0.16. Note from Table 6 that registered vital rates were both high and generally (perhaps with the exception of Peshwar division) very plausible; there is every reason to suppose that the registration system worked rather well in Punjab at this time

With this as background, Table 7 gives key district-level data, with particular reference to the main famine period (i e 1899-1900). Again, we have distinguished those districts which were officially classified as famine-affected. The drought in 1899, however, appears to have been widespread; all districts experienced a shortfall of rains. And the intensity of drought does not seem to have been particularly restricted to the declared famine districts. In several non-famine districts the deficiency of rainfall was also very appreciable (e g, Montegomery, Gurdaspur and Dera Ghazi Khan). But, as already noted, the actual loss of agricultural production depends partly on the degree of monsoon dependence. And on this count the famine districts appear to have been particularly disadvantaged; while the average shortfall in rains in the famine districts was only slightly larger than in the non-famine districts, the loss of harvested area was very much greater (by 38 points, Table 7).

The implications for famine distress are also clearly reflected in two other measures, namely, the indices of land sales and the number of cows in 1899-1900 (compared with 1893-94). Cattle mortality is generally believed to be an index of famine severity. And sale of property (particularly land) is often thought to be a means of last resort for those who have some property. It is clear from Table 7 that in famine districts there was overall a reduction in cattle of about 17 per cent, while most of the non-famine districts experienced an increase. The increase in the number of cows in the non-famine districts may partly be due to a net transfer by means of distress sales in the severely affected districts. Similarly, the frequency of land sales in the famine districts increased during the crisis by nearly 60 per cent (from the normal level) while in the non-famine districts this increase was only 17 per cent. This is again indicative of a higher degree of distress in the famine districts as a whole.

Turning to district-level price indices, Table 7 shows relatively small differences, on average, between the famine-affected and other districts. This was again partly due to the increased level of market integration, backed up by the advance of thr transport network. Thus, the spatial integration of markets in the absence of state controls spread price hikes across the province, and thus made variation in food prices an inadequate indicator of regional variation in crop failure.

The proportionate increase in deaths in 1900 was generally much larger in the famine than in the non-famine districts Among the officially declared famine districts, Hissar experienced both the highest increase in deaths and the greatest reduction in births. This probably reflects its acute famine vulnerability, which is amply reflected in many of the relevant measures. The apparent improvement in registered mortality in Mooltan, one of the officially declared famine districts, is noteworthy. In terms of measures such as agricultural failure and cattle mortality, both Mooltan and Amritsar seem to have suffered relatively less severe distress, especially compared with the other 'famine' districts; and this may help to explain the rather negligible adverse mortality effects in these two districts. This said, some non-famine districts also experienced significant increases in registered deaths (e g, see Jhang, Ludhiana and Montegomery in Table 7) In fact, there was a wide range of variation in proportionate increases in mortality between the districts of Punjab.

Table 8 provides a correlation matrix involving the measures presented in Table 7. It shows that the correlation coefficient between the district-level indices of shortfalls in rainfall and the area under cultivation is negative but not very high (-0.38). However, the correlation between the proportion of harvested area of crops compared to normal and the index of cattle stock is positive and fairly strong. But correlation coefficients between the district-level price indices and both the indices of land cultivation and cattle stock were low (but, as expected, negative). This probably confirms that extent of crop failure was a better indicator of regional intensity of famine distress than price rises. Mortality increases appear to have been somewhat large in those districts which were generally more affected by crop failure (Table 8). However, note that this correlation is smaller than found for the preceding famines. Also, the correlations of mortality increase with various measures of distress across all districts in Table 8 are relatively weak.[33] This indicates that the distribution of mortality across districts was far from being solely determined by crop failure. Interestingly, however, the district-level reductions in births were strongly associated with most of the indices of distress (Table 8).[34] So the regional variation in fertility reduction (especially in the early stage) was a better measure of the severity of distress than was the pattern of mortality elevation.

TABLE 8: CORRELATION MATRIX OF THE DEMOGRAPHIC AND OTHER MEASURES PRESENTED IN TABLE 7—PUNJAB FAMINE OF 1899-1900

* Significant at 1 per cent level.

** Significant at 5 per cent level.

*** Significant at less than 10 per cent level.

As we have already stressed, regional pattern of famine mortality may significantly be influenced by the pattern of relief, the nature of epidemics and migration. Turning to the officially declared famine districts it can probably be suggested that relief was relatively large in those districts which were relatively severely affected. But the data for Jhelum provide an exception to this generalisation; while its intensity of distress as reflected by the relevant measures in Table 7 was quite similar to Hissar's, it received a negligible quantity of relief. On the other hand, Jhelum experienced a comparatively small rise in deaths. Emigration from Jhelum may be part of the explanation. Indeed, the lieutenant-governor in the home department of Punjab wrote that "[i]n Jhelum and Shahpur which show low birth-rates and low death-rates, the figures are principally due to emigration consequent on scarcity".[35] Test works in Jhelum (at Jalalpur Canal) were opened late in February of 1900; although the number of persons employed immediately rose fairly high, it then fluctuated, and it was thought that the "condition of those who attended was not such as to call for its [i e, canal work] conversion into relief work".[36] The reason for the smaller relief provision in Jhelum, thus, may partly be due to the relatively small mortality increase itself. The relatively small provision of relief may in turn have induced emigration from the district

Indeed, it appears that the number of persons relieved was relatively high in those districts which experienced relatively high proportionate increases in mortality (Table 7).[37] A part of this relation may stem from the fact that relief provision was relatively large in the severely affected districts. However, this also reflects the inadequacies of the relief policy. In a study of Hissar (which experienced the largest increase in deaths) a large part of excess mortality during this famine has been attributed to the very stringent and inadequate nature of relief.[38] Relief works applied harsh regulations and offered very low wages so that debilitated workers could not benefit much from the provision of such relief. Gratuitous relief was small, and it was extended mostly to those who were already on the brink of death. For example, the deputy commissioner of Hissar district himself wrote that 'It may be argued that the fact of the high mortality occurring among recipients of relief would tend to show that either relief reached the necessitous too late or that something connected with the famine administration itself was a cause of the great mortality''.[39]

However, there were of course exceptions to the positive relationship between relief provision and mortality increase. For example, Ferozepur experienced the second highest mortality increase but received an insignificant amount of relief. In fact, the

Sources: Columns (2), (3) and (4): *Resolution on the Administration of Famine Relief in the United Provinces of Agra and Oudh during the Years 1907 and 1908*, Government Press, Allahabad 1908; columns (5) and (6): *Report on the Sanitary Administration of the United Provinces of Agra and Oudh*, Government Press, Allahabad, various years.

data on crop losses, reductions in births and land sales all indicate that Ferozepur was indeed relatively less severely affected compared to many of the other famine districts. The official report on the famine stated that "fortunately no portion of its [Ferozepur] area reached a state of acute distress".[40] Similarly, Lahore appears to have received scant relief probably because of the lesser severity of the famine in that district (reflected too in measures of crop loss, fertility reduction, land sales and livestock loss); but Lahore nevertheless registered a substantial increase in mortality (Table 7).

The epidemic malaria was probably the most important killer in the Punjab famine of 1899-1900.[41] And once such an epidemic breaks out the usual forms of relief (e g, provision of works or dole) are unlikely to be of much help in mitigating excess deaths. Indeed, the outbreak of malaria occurred late 1900 when relief had mostly been withdrawn.[42] During this (malaria) epidemic stage part of the regional variation in mortality may well have been influenced by variation in malaria ecology (e g, malaria endemicity). For example, it is probable that the more endemic was the malaria in a district during the pre-famine period, the less would be the severity of a subsequent epidemic in the wake of a famine, owing to greater levels of immunity.[43] Such factors may also have exerted some influences in shaping the regional pattern of mortality during the famine.

In this connection the experience in the non-famine district of Jhang is particularly interesting. While the harvested area of crops more than doubled in 1899 from its 'normal' level, the proportional increase in the number of registered deaths in 1900 was larger than in many of the severely affected famine districts (Table 7). Note that the number of registered births in this district also rose substantially in 1900. All this can probably be taken as indicative of a significant amount of immigration during the famine. Indeed, there were a number of districts (even among the famine districts) in which the number of registered births increased from pre-famine levels. The cases of Karnal and Lahore (both famine districts) are particularly noteworthy on this count. They too both experienced rises in births while also experiencing considerable excess mortality. However, the index of births in 1900 largely reflects the outcome of conceptions in 1899. Since there were some territorial changes in Punjab in 1901, it is difficult to calculate comparable measures of changes in the number of births for all districts in that year. But in 1901 almost all districts for which comparison could easily be made showed a reduction in births (except for Jhang and Mooltan). On the whole, the negative effects of famine on fertility seem to have been larger in the officially declared famine districts.

United Provinces Famine Of 1907-08

Table 9 presents measures for 48 districts relating to the United Provinces famine of 1907-08. The districts were classified by the official famine report into three categories, namely, 'famine', 'scarcity' and 'non-famine' districts. This categorisation (which we also use here) was usually the responsibility of the district administration. It is clear from Table 9 that most districts experienced a considerable shortfall in monsoon rains in 1907. Consequently, crop failure was not restricted to the famine and scarcity districts. However, on the whole the extent of harvest failure in 1907 seems to have been larger in the famine districts. It is notable that there was hardly any difference in the overall shortfall of rain or harvested crops between the scarcity and non-famine districts.

But one important implication of this official classification was that non-famine districts were given almost no relief. As Table 9 shows, there was a remarkable difference in the amount of gratuitous relief provided between the famine and the scarcity districts. This discrepancy was not restricted to gratuitous relief. Indeed, a similar discrepancy in overall relief provision (in favour of the famine districts) is also indicated by the data contained in the report on the administration of the famine.[44] Therefore the official diagnosis of famine severity between districts seems to have had important implications for the scale of relief provisions.

As can be seen, the overall reduction in births appears to have been somewhat larger in the famine districts, particularly compared to the non-famine districts. As Table 10 shows, the correlation coefficient between the indices of crop failure and reduction in births is positive and statistically significant. However, the relatively low degree of association compared to that we have found in the earlier famines may partly reflect the increased level of economic integration and partly the favourable influence of a relatively effective and liberal relief provision in the affected areas.

Relatedly, on the whole both the scarcity and non-famine districts appear to have experienced a roughly similar magnitude of mortality increase as in the famine districts.[45] Note too from Table 10 that there is hardly any correlation between the measure

Table 10: Correlation Matrix of the Demographic and Other Measures Presented in Table 9, United Provinces Famine of 1907-08

of crop failure and mortality rise. Apart from the possible effects of increased market integration and consequent diffusion of crisis, a part of the explanation for this may lie in favourable effects of relatively large relief provision in the famine districts.

Indeed, comparison with some of the earlier famines, say those in 1876-78 and 1899-1900 suggests that mortality increases in this famine were distinctly smaller (compare, for example, Tables 2 and 9). A relatively small excess mortality in this famine has sometimes been attributed to the efficient management of the famine.[46] It is true that this famine was not as widespread as former 'countrywide' food crises (e g, that of 1896-97). Therefore food could be imported from neighbouring provinces. Again, the labouring classes migrated out to other provinces where they were able to find remunerative employment There are indications (e g, an increased value of money orders sent back to the affected districts) that emigrants were even able to send remittances to support their dependents at home.[47] However, the number of such emigrants seems unlikely to have been sufficiently great to influence the famine's demographic consequences.[48] This said, the relief policy adopted during this famine appears to have been both relatively liberal and rational. As the report on the administration of the famine states, "the crop failure of the present year [1907-08] was serious enough to have caused widespread distress if the measures of relief adopted by government had not been both prompt and liberal".[49] A liberal suspension of land revenue and as well as large grants of advances for farmers' subsistence and agricultural production, characterised the relative emphasis on indirect forms of relief during this famine. Interestingly, the large advances made to agriculturists, especially for irrigation and cultivation of the spring crops, helped maintain (and perhaps even increase) the demand for labour, and in turn this helped to keep market wage rates relatively high: Moreover, the fixing of wages on the relief works was modified so that, unlike the old policy, it was based not on what would be sufficient for the worker only, but on ordinary market wage rates instead.

Emphasis was also placed on village works so that people did not need to congregate around large relief works sites. 'Aided' village works, which were undertaken by landholders using advances given by the government, appeared as a prominent means of relief. They were so popular that on June 4, 1908 about 1,77,185 persons were employed on such works. The wages paid in these aided village works "were as a rule higher than the rates paid on government works and approximated to the ordinary wages of labour prevailing in the vicinity."[50] The implication of such policies lay partly in reducing deprivation and distress among farm labourers. But it also meant relatively less congregation at large work camps and this probably helped contain the spread and virulence of epidemic diseases such as cholera, dysentery and diarrhoea, which were all comparatively minor problems during this famine. Finally, an increased emphasis on the provision of gratuitous relief to the dependents of relief workers was also a cornerstone of relief policy during this famine. Indeed, the ratio of workers' dependents relieved (gratuitously) to the total number of relief workers was 0.44 in 1907-08, compared to only 0.24 in 1896-97.[51] The proportion of persons receiving gratuitous relief to the total number on relief reached 54 per cent during this famine. The Famine Commission of 1901 had recommended that this figure should not exceed 42 per cent. Thus emphasis on relieving workers' dependents as well as the liberal nature of the relief policy—the policy being adopted in far greater measure in the famine districts than in the scarcity districts (Table 9)—can probably be held as partly responsible for the somewhat lesser mortality rise. Again, the view that a relatively more gratuitous and liberal relief policy played a significant part in containing mortality during this famine gains support from the absence of a positive correlation between relief provision and mortality increase.[52]

Discussion

We now summarise and review major findings on the regional variation in demographic and other variables during four major historical famines (in the context of individual locations). Our foregoing district-level analysis for the Bombay famine of 1876-78 shows that the intensity of distress varied markedly between the affected and non-affected regions. In turn, this was also reflected in greater variation of adverse demographic consequences between the affected districts and those not affected. In fact, transport and communication system of earlier decades was very limited. Thus, during the 1870s the very restricted road and rail network inhibited both fast transport of grain and population movement.[53] So less affected famine areas seem to have been relatively insulated from both price rises and the spread of epidemics, while famine affected districts could not be supplied rapidly with grains.[54] As can be seen from Table 11, both the scale and regional disparity in demographic impact during the famine of 1876-78 appears to have been larger than during the famines of 1896-97, 1899-1900, and 1907-08. Note too a weakening of strength of association over time between the district-level extent of crop failure and adverse demographic effects. In fact the regional variation in price rises has been a relatively poor indicator of the variation both in distress and associated demographic impact. On the other hand, compared with mortality variation, regional variation in the reduction in births seems to have been a better indicator of the variation in the measures of famine distress (such as the extent of failures in rain and crop production).

Thus, while increasing transport and communications over time may have played a role in augmenting the diffusion of the intensity of crisis,[55] overall scale of mortality elevation seems to have depended at least partly on the nature of relief provision.[56] For example, much greater increase in mortality (and larger reduction in births) during the famine of 1876-78 compared to later famines does not seem to relate to the severity of drought and crop losses. Indeed, as we have shown earlier, on these criteria the later famines—particularly during 1899-1900 and 1907-08—appear to have been no less severe than the famine of 1876-78.[57] Again, it was not that relief provisions in terms of the number of persons on paid works during the 1876-78 famine were particularly inadequate. In fact the average daily number of persons on relief during the 1876-78 famine compares favourably with that during later famines (Tables 2, 4, 7). Furthermore, as has been shown above, the regional distribution of relief provision seems to have broadly corresponded to regional variation in severity of drought and crop losses. But the proportion of persons on gratuitous relief appears to have been much lower in the Bombay famine of 1876-78 compared to later famines (Table 11). This probably partly reflects the more harsh relief policy during the 1870s (i e, before the establishment of the Famine Codes).[58] That the relief policy during the famine of 1876-78 was very severe and punitive in character (especially compared with later relief policy) has been documented by several authors.[59] Indeed, district-level data on relief and mortality do not support the idea that the greater the relief provided in a district, the smaller the adverse mortality effects during the famine (Table 11). This probably partly stems from the fact that relief provision was generally larger in the most severely affected districts. This said, relief policy too must have been deficient in mitigating vulnerability of the population in the affected areas. This brings us to the issue of the nature of relief.

Indeed, a declining trend in the quantum of excess famine mortality over the decades since the 1870s has been observed, and this has often been attributed to a trend towards more 'liberalism' and 'flexibility' in relief policy (as formulated by the successive Indian Famine Commissions)—a trend which was sometimes helped by expansion of transport and communications network and creation of alternative employment opportunities.[60] But the formulation of Famine Codes and a more rational relief policy does not guarantee their implementation. Although relief policy became more liberal

during the decades since the 1870s, it was sometimes very harsh and deficient in several respects (e g, delayed response, non-adherence to Famine Codes). The relief policy has often been criticised as being influenced by "wait and see" attitude on government's part.[61] While stressing the extreme stinginess of relief policy Dreze remarks that "[i]n particular, the level of wages paid on relief works was extraordinarily low...As a result, during the most severe crises the availability of work did not always prevent a considerable enfeeblement of affected people, and their enhanced vulnerability to epidemics".[62]

This point is illustrated by the fact of a larger increase in mortality during the Punjab famine of 1899-1900 than both during the famines of 1896-97 and 1907-08 (Table 11). As has been discussed before, the relief policy as adopted during the Punjab famine was particularly punitive and harsh. The chief engineer of the Public Works Department in the Punjab government concluded that "some part" of the excess mortality in the famine of 1899-1900 was "due to the greater severity of our famine works as compared to the last [1896-97] famine".[63] That relief provision was relatively deficient in 1899-1900 is also reflected in the high positive correlation between district-level relief provision and mortality increase. In contrast, the relief policy as implemented in Bombay during 1896-97 seems to have been better organised and more rational in taking especial care for workers' children and dependents, and also in protecting sanitary condition at large relief camps. As has already been discussed, the relief measures during the famine of 1907-08 in United Provinces too were remarkably liberal and rational. Note from Table 11 that the proportion of gratuitous relief during this famine was far larger than in the preceding famines. Note too that in case of these two famines no positive relationship was found between district-level relief provision and mortality increase, confirming the greater effectiveness of relief provision than in the Punjab famine of 1899-1900. This is not to suggest that inter-district variation in mortality rises was solely related to the nature of relief. In fact, regional variation in ecology and inter-district migration also seem to have contributed to the variation in demographic impact.

All these considerations, thus, suggest that although during the last decades of the 19th century India witnessed the establishment of a well-defined famine relief system, which partly contributed to the declining trend in overall excess famine mortality, the role of relief continued to conform to the popular notion "which conjures up the picture of a battle already half lost and focuses the attention on emergency operations narrowly aimed at containing large-scale mortality."[64] Indeed, as has been amply documented by several authors, this was probably proved again during the Bengal famine of 1943-44.[65]

Notes

[The author is grateful to Tim Dyson who read an earlier draft of this paper and offered many useful comments and suggestions.]

1 Indeed famine has often been defined in terms of demographic consequences, particularly its mortality effects; see D Arnold, *Famine*, Basil Blackwell, Oxford, 1988; M Alamgir, *Famine in South Asia: Political Economy of Mass Starvation*, Oelgeschlager, Cambridge, Mass, 1980; Amartya Sen, *Poverty and Famines*, Oxford University Press, Oxford, 1981.

2 Reviewing the literature on famine demography, G Hugo concluded in 1984 that "demographers have generally neglected the response to famine as a field of study"; see G Hugo, 'The Demographic Impact of Famine: A Survey' in B Currey and G Hugo (eds), *Famine as a Geographical Phenomenon*, Dordrecht, Riedel, 1984, p 28.

3 For a general (and somewhat theoretical) discussion, see J Bongaarts and M Cain, 'Demographic Responses to Famine' in K Cahill, *Famine*, Orbis Book, New York, 1982; G Hugo, ibid; and S C Watkins and J Menken, 'Famines in Historical Perspective', *Population and Development Review*, Vol 11, No 4, 1985. The recent careful demographic studies of south Asian famines include Tim Dyson, 'On the Demography of South Asian Famines', Part I and II respectively in *Population Studies*, Vol 45, Nos 1 and 2, 1991; R Lardinois, 'Famine, Epidemics and Mortality in South Asia: A Reappraisal of the Demographic Crisis of 1876-78', *Economic and Political Weekly*, Vol 20, No 11, 1985; L C Chen and A K M A Chowdhury, 'The Dynamics of Contemporary Famine', *International Population Conference*, Mexico, Volume 1, 1977; A Razzaque, 'Socioeconomic Differentials in Mortality during the 1974-75 Famine in a Rural Area of Bangladesh', *Journal of Biosocial Science*, Vol 21, No 1, 1989; and Amartya Sen, op cit, Appendix D. For several references on the recent studies on the demography of African famines see Jean Dreze, 'Famine Prevention in Africa' in Jean Dreze and Amartya Sen (eds), *Political Economy of Hunger, Volume II*, Clarendon Press, Oxford, 1990; and also Tim Dyson, ibid, Part II.

4 This is largely because of the availability of India's registration data for the whole period since the 1870s. This contrasts with the most other third world countries (especially African and Latin American) where registration system is still generally in its infancy.

5 Tim Dyson, op cit. For a background discussion on these famines, see Tim Dyson, op cit, Part I, and also the references cited by him.

6 All these locations were actually respective provinces under British administration.

7 For a description of the severity and geographical spread during these famines, see B M Bhatia, *Famines in India: A Study in Some Aspects of the Economic History of India (1860-1965)*, Asia Publishing House, London, Second Edition, 1967. Although the famine of 1907-08 was probably less widespread than those of 1876-78, 1896-97 and 1899-1900, it was quite severe particularly in United Provinces.

8 Since the inception of the registration system (i e, since the 1870s) the Sanitary Commissioner of each province was responsible for producing an annual report, containing quite detailed registration data (e g, deaths, births, cause of death, etc). The information on vital events was collected by village watchman (or 'chowkidars'), each being responsible for a particular jurisdiction.

9 On the relatively good registration in these regions, see M B McAlpin, *Subject to Famine: Food Crises and Economic Change in Western India, 1860-1920*, University Press, Princeton, 1983, p 50; Tim Dyson, 'The Historical Demography of Berar, 1881-1980' in Tim Dyson (ed), *India's Historical Demography*, Curzon Press, London, 1989; Census of India 1901, *Punjab Volume XVII, Part I*, Simla, 1902, pp 41-42.

10 Indeed one stated motive behind the establishment of the registration system in India was to monitor mortality trends during periods of crisis; on this see Tim Dyson, op cit, p 10. The Sanitary Commissioner of Bombay Presidency wrote: "[t]here can be no question that the increased attention paid to the registration by the large staff of village inspectors throughout famine districts had led to much greater accuracy in the number of deaths returned in 1877 [i e, peak mortality year]"; see *Annual Report of the Sanitary Commissioner for the Government of Bombay, 1977*, Government Press, Bombay, 1878, p 139.

11 For a useful description of these drought-caused late-19th century Indian famines, see Jean Dreze, 'Famine Prevention in India' in Jean Dreze and Amartya Sen (eds), *The Political Economy of Hunger*, Vol II, Clarendon Press, Oxford, 1990.

12 While governmental participation in trade and distribution of food during the subsistence crisis is sometimes seen as an effective means of protecting the food entitlement of vulnerable sections of population, the British administration was almost obsessively against the policy of state intervention in free market operations and private trading; on this see Jean Dreze, 'Famine Prevention in India', ibid, pp 27-28. For a discussion on the influence on the British famine relief policy of the classical ideas favouring operation of free market forces and its implications, see S Ambirajan, *Classical Political Economy and British Policy in India*, University Press, Cambridge, especially pp 69-100; see also Amartya Sen, op cit, pp 160-62.

13 For a useful discussion of the basic principles and rationale behind the relief policy—and also its evolution—during the closing decades of the 19th and early 20th centuries, see Jean Dreze, ibid, pp 25-32, and also H S Srivastava, *The History of Indian Famines and Development of Famine Policy, 1858-1918*, Sri Ram Mehra, Agra, 1968.

14 See M B McAlpin op cit, p 48.

15 The whole of Sind division is now included in Pakistan.

16 See *Report on the Administration of the Bombay Presidency*, Government Press, Bombay, various years; see also S Qureshi, *The British Annexation of Sind*, Council of British Pakistanis, Bromsgrove, Monograph No 1, 1988, p 3.

17 M B McAlpin op cit, p 26.

18 The contemporary sanitary commissioner for Bombay presidency in his annual reports commented upon some of the special difficulties faced by efforts to instigate registration in Sind.

19 See also M B McAlpin, op cit, pp 54-55. Indeed McAlpin has suggested that both low birth and death rates in Konkan may imply a different pattern of population growth—a pattern which implies "less wastage of human life". The underlying hypothesis is that "in Konkan, where the population was less subject to abrupt rises in the death rate due to

famine, society had evolved norms for somewhat lower fertility resulting in lower birth rates", see p 56.

20 The district-level annual data on agricultural livestock also show large losses during the famine in the Deccan compared to other divisions; see,e g, *Report on the Administration of the Bombay Presidency for the Year 1877-78*, Government Press, Bombay, 1878, p 181.

21 See *Report on the Administration of the Bombay Presidency for the year 1877-78*, Bombay, 1878, p 361.

22 Ibid, p 360.

23 Ibid, p 160.

24 As Bhatia writes about this famine, "[t]he guiding principle in the management of this famine was to secure maximum economy in relief expenditure"; see B M Bhatia, op cit, p 92.

25 See *Report on the Famine in the Bombay Presidency 1899-1902*, Government Press, Bombay, 1903, Volume I—Report, p 3.

26 There was, indeed, a considerable increase both in population and registered vital rates between the 1870s and 1890s in Bombay Presidency. But the basic normal patterns of regional variation that we have found prior to the famine of 1876-78 (see Table 1) seem to have remained largely valid prior to the famine of 1896-97.

27 See B M Bhatia, op cit, p 241.

28 See B M Bhatia, op eit, p 244.

29 The correlation coefficients of the numbers of persons on relief with the indices of crop failure and reduction in births are respectively 0.71 and 0.69.

30 See B M Bhatia, op cit, p 247

31 The Sanitary Commissioner of the Bombay Presidency reported the following to the Indian Famine Commission: "I consider the relief camps were kept in good sanitary condition and precautions taken, certainly at all large camps, to protect water supply"; "As far as I am aware there was no abnormal deficiency in the water-supply"; see *Appendix to the Report of the Indian Famine Commission 1898*, Vol III—Bombay Presidency, London, 1899, p 239.

32 Areas from some of these 31 districts were taken out of Punjab to constitute a separate administrative province, namely, the North-Western Frontier Province in 1901. Then Punjab consisted of 27 districts.

33 The correlation coefficients between the index of deaths and the indices of cattle stock and land sales are respectively -0.35 and 0.21 (Table 4.8). Note also that the positive association between the rises in human and cattle mortality is statistically significant.

Note that unlike the previous famines the district-level indices of births in Punjab are given for the prime famine year (i e, 1900), while a large part of the effect on conceptions in 1900 should be captured by the respective numbers of births in the following year. This was necessitated because of non-availability of comparable data for several districts after some areas were taken out of Punjab in 1901. However, for those districts for which comparison could be made the correlation coefficient between the index of harvested area in 1899 and index of births in 1901 is found to be 0.30.

Quoted in *The Punjab Famine of 1899-1900*, Volume I, Government Press, Lahore, 1901 (no page number).

Ibid, p 9.

Indeed, the correlation coefficient between the daily average number of persons on relief per 1,000 population and the mortality indices across the 13 famine districts is positive and significant (0.70). It may also be noted that coefficient stays exactly the same (0.70) when average daily numbers of persons on relief (irrespective of population size) in the districts are used.

38 See D Guz, 'Population Dynamics of Famine in Nineteenth Century Punjab, 1896-97 and 1899-1900' in Tim Dyson (ed), *India's Historical Demography: Studies in Famine, Disease and Society*, op cit.

39 See *The Punjab Famine of 1899-1900*, Lahore, 1901, Volume II, Appendix XVIIII, pp 163-64. On this issue, see also D Guz, ibid; Dreze, 'Famine Prevention in India', op cit, and B M Bhatia, 'Famine and Agricultural Labour: A Survey', *Indian Journal of Industrial Relations*, Vol 10, No 4, 1975.

40 See *The Punjab Famine of 1899-1900*, Lahore, 1901, Volume I, p 8.

41 On this see the Punjab Sanitary Commissioner's annual reports for 1990 and 1901.

42 See the *Annual Report of the Sanitary Commissioner for Punjab for the Year 1900.*

43 See G Harrison, *Mosquitoes, Malaria and Man: A History of the Hostilities since 1880*, John Murray, London, 1978, especially pp 199-207.

44 See *Resolution on the Administration of Famine Relief in the United Provinces of Agra and Oudh during the Years 1907 and 1908*, Government Press, Allahabad, 1908, especially chapter VIII.

45 As the Report on the famine administration states, "One conclusion seems to follow from the experience of the present year [1908], namely, that the distinction between scarcity and famine admits of better definition than is at present given in the Famine Code. General opinion seems in favour of defining famine districts to be those districts in which relief works with relief to dependents are needed, and scarcity districts as those in which gratuitous relief and aided works without relief works afford all the aid to distress that is necessary"; ibid, p 86.

46 As Bhatia writes, "As a result of the famine there was only a small excess of mortality over the normal rate and the local government was congratulated by the secretary of state on the efficient manner in which the famine had been managed"; see B M Bhatia, *Famines in India*, op cit, p 269.

47 See Bhatia, *Famines in India*, op cit, p 267.

48 As the report on the administration of the famine remarks, "[t]here was no organised movement of the population from the distressed areas in search of work, no considerable emigration to or immigration from naive states, and in fact no noticeable wandering at all"; see *Resolution on the Administration of Famine Relief in the United Provinces of Agra and Oudh during the Years 1907 and 1908*, op eit, p 150.

49 Ibid, p 150.

50 Ibid, p 83.

51 Ibid, p 74.

52 In this connection, it may be noted that migration (especially from adjoining regions) during this famine was rather limited; see *Resolution on the Administration of Famine Relief in the United Provinces of Agra and Oudh during the Years 1907 and 1908*, p 128.

53 In the aftermath of the famine of 1876-78 the *1880 Indian Famine Commission* recommended direct state efforts for extending railways and irrigation.

54 Referring to the period before large-scale development of the railways, Dreze writes that "[e]ntitlement failures were exacerbated by the sluggishness of trade and the large price disparities prevailing between adjacent regions"; see Jean Dreze, 'Famine Prevention in India', op cit, p 21. As Srivastava writes, "lack of satisfactory communications... severely restricted the movements of food grains so that while in one part of the country people died of lack of food, in another, only a few miles away, there was an abundance of cheap food"; see H S Srivastava, op cit, p 7.

55 Railway mileage in India increased from 9,891 in 1881 to 19,555 in 1895; see K Currie, 'British Colonial Policy and Famines: Some Effects and Implications of 'Free Trade' ion the Bombay, Bengal and Madras Presidencies, 1860-1900', *South Asia*, Vol 14, No 4, 1991, p 55.

56 It has sometimes been argued that the construction of roads and railways did not necessarily function as protective against famine mortality; see, e g, K Currie, ibid.

57 However, it should be mentioned that the Bombay famine of 1876-78 may be considered as being more severe than the later famines in one respect at least, namely, that it involved the occurrence of *two* successive serious droughts.

58 Indeed the severity of the famine of 1876-78 (particularly in terms of excess mortality), at least partly, prompted the establishment of the first Indian Famine Commission (of 1880), which, in turn, laid the foundation of India's subsequent relief system, namely, the Famine Codes (i e, guidelines to the local administration for anticipation, recognition and relief of famines). The first 'Draft Famine Code' was submitted along with the Famine Commission Report of 1880. Each province was asked to frame its own code by adapting the model contained in the Draft Code to its own circumstances. For details, see Jean Dreze, *Famine Prevention in India*, op cit, and also H S Srivastava, op cit.

59 See B M Bhatia, *Famines in India*, op cit, H S Srivastava, op eit, and also K Currie, op cit.

60 See, e g, R E Seavoy, *Famine in Peasant Societies*, New York: Greenwood Press, 1986, especially p 242; I Klein, 'When the Rains Failed: Famine, Relief, and Mortality in British India', *Indian Economic and Social History Review*, Vol 21, No 2, 1984, M B McAlpin, op cit, and Jean Dreze, *Famine Prevention in India*, op cit.

61 See, e g, M Alamgir, op cit, p 83. Referring to the implementation of the Famine Code, Guz writes that "[i]t [government] stepped in once excess mortality and severe social disruption had occurred"; see D Guz, op cit, p 217.

62 See Jean Dreze, *Famine Prevention in India*, op cit, p 34.

63 See *The Punjab Famine of 1899-1900*, Volume 2, Lahore, 1901, pp 90-92.

64 See Jean Dreze and Amartya Sen, *Hunger and Public Action*, Clarendon Press, Oxford, 1989, p 67.

65 On the failure of relief provision during the Bengal famine of 1943-44, see Famine Inquiry Commission, *Report on Bengal*, Government Press, New Delhi, 1945; Amartya Sen, op cit, especially chapter 6 and Appendix D; P R Greenough, *Prosperity and Misery in Modern Bengal: The Famine of 1943-44*, Oxford University Press, New York, 1982 especially pp 127-138; and also Arup Maharatna, 'Regional Variation in the Demographic Impact during the Bengal Famine of 1943-44', *South Asia Research*, May, 1993, and Arup Maharatna, 'The Demography of the Bengal Famine of 1943-44: A Detailed Study' (appearing), *Indian Economic and Social History Review.*

Debt Crisis and Economic Reforms

S P Gupta

Any study of the growth of India's external debt cannot be undertaken in isolation from the growth of domestic public debt. The question is whether the present economic reform will succeed in reversing the rising trends in debt service ratio and percentage of public and external debt to GNP in a sustainable fashion. An attempt is made here to answer the question with the help of a simple macro-economic model.

THE present economic reform in India has been triggered primarily by an external debt crisis, mainly an outcome of her domestic fiscal imbalance, i e, overspending by the government. Three years of this reform have already passed. The impact of some of the policies under this reform is now perceptible. There is a general feeling from the experience of other countries that for accessing the full impact of such policies, the three-year period is 'too short'. At the same time, it is felt that as far as mid-course corrections in the policy packages are required, it will be too late if their results are not detected in time.

To start with, one would like to identify all key factors leading to the present debt crisis; because only then can one assess whether all the fiscal and monetary packages presently initiated under this reform could help the economy to deactivate these factors, so that the economy can come out of the present crisis in a sustainable fashion.

The government has recently brought out a *Status Report on External Debt* (October 1993). This has placed India's external debt at a high figure of $ 74.5 billion (excluding defence) and $ 85.4 billion (including defence) in 1993 and as percentage of GDP 33.4 and 38.3 respectively in 1992-93. There is a sharp difference of opinion among economists about the viability of this level of debt burden. For example some read this statistic as a forewarning for an impending or continuing debt crisis. But if one makes an inter-country comparison, one will notice that among 30 major developing countries (barring China and Republic of Korea), all have an external debt ratio to GNP higher than that of India in 1991. The concern, therefore, should not be for this level of debt to GNP ratio. Alternatively it is the debt service ratio of a country that conventionally measures its repayment abilities, which should be of real concern. Using this indicator, there are only three countries Zambia, Algeria and Argentina among 30 selected developing countries mentioned in the *World Development Report 1992-93* which are above India. In India (even excluding defence debt), this ratio is higher than one-third of exports and showing an ever-increasing trend.

External debt accumulates basically from the growth of the current account balance financed by contractual borrowing. Its servicing commitments depend on the composition of its financing sources having different schedule of repayments and levels of interest charges. I do not like here to narrate the familiar reasons for how the 'grant element' of India's external borrowing has eroded over time, thereby aggravating her servicing liabilities. In a nutshell, there has been all along a heavy shift from mid-80s from official to commercial borrowings (bearing comparatively high interest rates and having shorter maturity periods). The large current account balance in its turn can be ascribed to the continuing large domestic fiscal deficit creating heavy excess demand in the domestic market. At times in the past, a part of the pressure of this excess demand has been absorbed by squeezing investment in the private sector (the 'crowding out' effect) through priority borrowing (under SLR) by the public sector. This is why the relation between high fiscal deficit and high current account balance in the external sector has not always been one-to-one. But over time the private sector has been squeezed so much, almost reaching a 'saturation' point, that the impact of any further large fiscal imbalance is likely to be transmitted largely to the external sector. Besides, with the recent reduction in the SLR and the market orientation in government borrowing, any more squeezing of the private sector will not be possible.

This is why, any study on the growth of India's external debt cannot be undertaken in isolation from her domestic public debt. The external debt as percentage of exports (goods and non-factor services), in current dollars

TABLE 1: ASSUMPTIONS—ALTERNATIVE PUBLIC DEBT SCENARIOS

	(A) Base Case	(B) Optimistic Case
(a) Fiscal deficit (central government)	7.0 per cent (1994-95 to 2003-04)	6 5 per cent (1994-95 to 1996-97) than 6 0 per cent there on
(b) Budgeting deficit (central government)	0.7 per cent -do-	Same as base case
(c) Revenue deficit (central government)	4 3 in 1994-95 and then 4.0	4.3 per cent in 1994-95, 4.0 per cent in 1995 96 and then 3.5 per cent until 1998/99 and there on 3 0 per cent per annum.
(d) Interest rates	10.02 (BE) for 1994-95 and then 12 0 per cent (1995-96) 13.0 per cent (there on)	10 2 in 1994-95 and then 11 per cent there on
(e) Real GDP growth	5 0 althrough	Same as the base case
(f) Inflation rate	9 0 (1994-95 onwards)	8 0 in 1994-95 and onwards
(g) Population growth	2.1 per cent (1994-95 onwards)	Same as base case

TABLE 2. ASSUMPTIONS—ALTERNATIVE EXTERNAL DEBT SERVICES

	(A) Base Case	(B) Optimistic Case
(a) to (g) refer to Table 1	Same as the public debt scenario (Base case)	Same as the public debt scenario (Optimistic case)
(h) Real growth of exports (goods and nfs)	9 per cent in 1994-95; 8 per cent thereafter	13 0 in 1994-95; 15 0 thereafter
(i) Nominal average interest rate-charges for external debt	7.3/8.0/8.3/8.5/8.6/8.7/8.8/8 8/8 8 for 1994-95 to 2002-03	As the base case
(j) Repayment schedule	As given in *World Bank Report* and extrapolated	As the base case
(k) Trade balance as percentage of GNP	1.2 to 1.4	0.7-1 5
(l) Import elasticity	1.21	1 30
(m) Rupee depreciation	3.9 per cent per annum from 1994-95 to the end	10 per cent per annum from 1994-95 to the end
(n) FDI	Disbursement around $ 800 in 1994-95, rising to $ 1.46 million in 2002-03	Disbursement around $ 800 in 1994-95, rising to $ 2 billion in 2002-03

increased from 257 per cent to 313 per cent between 1984-85 and 1992-93 almost monotonically and the debt-servicing at percentage of exports from 22 7 per cent to 31 3 per cent over the same period As percentage of GNP at current dollar, the external debt again increased from 17 5 per cent in 1984-85 to 28.8 per cent in 1991-92 (Table 12) The significant contribution to this increasing external debt came from growing public debt Public debt at the centre over this period rose from 49 3 per cent of GDP to 57 9 per cent of GNP almost monotonically and its external debt component increased from 35 5 per cent in 1984-85 to 43 3 per cent in 1991-92 Thus in 1992 the central government public debt covered 43 per cent of India's total external debt, besides there was the indirect impacts of growing domestic fiscal deficit on the external gaps when the excess demand spilled into the external market Now, the moot question is whether the present economic reform will be able to ameliorate this situation and reverse the increasing trends in the debt-service ratio and percentage of public and external debt to GNP, in a sustainable fashion

For this an attempt is made to examine the future trends in these few selected indicators to measure the likely debt build-up in India with the help of a simple macro-economic model The two most commonly used indicators are either debt expressed as percentage of GNP or debt-servicing (repayment and interest charges) as percentage of exports in the external case and as percentage of central government's fiscal deficit in the domestic case One test of an impending debt crisis is when these ratios continue to increase without any sign of a turning point over the

medium and long term. Such a situation is regarded as being potentially explosive and may ultimately lead to a loss of credibility about the country's capacity to fulfil the economy's debt liabilities, both internal or external and failing which the likely consequent severe economic and political repercussions.

Public Debt

The prime source contributing to domestic public debt in India is the increasing budgetary gaps.

Presently three types of budgetary gaps are mentioned in the official budget documents. The first type is defined as fiscal deficit which measures the gap between all central government expenditure (current and capital) and all revenue through tax and non-tax measures, including capital receipts. Then there is the budgetary deficit, where the government covers excess expenditure on income by printing notes, i e, borrowing from the central bank. The third is the revenue deficit, when the government even for financing its revenue expenditure borrows from the market, home and abroad, a source of finance which conventionally is used to cover developmental and capital expenditure. Another type which has recently been quoted in the central government's budget document is based on a concept of primary deficit, i e, the fiscal deficit net of all interest payments. However, this concept is valid only *vis-a-vis* the consolidated budget of a country (i e, centre and states taken together). The primary deficit of the centre in isolation should be calculated as the fiscal deficit net of gross interest payments less interest receipts from lending to the states. The *Budget at a Glance for 1993-94*, however, has mistakenly estimated centre's primary deficit as the difference between the gross fiscal deficit and gross interest payments.

These different concepts of budgetary gaps have different economic implications *vis-a-vis* the accumulation of public debt. Primary deficit adds to the public debt and measures, the degrees of freedom government enjoys in selecting its expenditure portfolio since it is *net* of all payments for contractual interest payments. Fiscal deficit, in the aggregate, gives the overall resource transfer from private to public sector. It has its significance in assessing the allocative efficiency of resources, determined by the relative rates of return of the public and private sector investments. Budgetary deficit normally has a bearing on inflation. It should be recognised that deficit budgets are not always inflationary. As the country's real demand for money increases along with real growth of income, a budgetary deficit equivalent to or less than this increased demand cannot generate inflation. This non-inflationary budgetary deficit as a source of public sector income will be higher if the economy grows faster. Similarly, with a higher rate of inflation, money demand also increases, thus providing some more room for raising the non-inflationary limit of the budget deficit. In India's case, it has been calculated that with a real growth rate of around 5 to 6 per cent and inflation around 6 to 8 per cent, the non-inflationary level of consolidated budget deficit is around 1.1 to 1.3 of GNP; i e, around 1.0 per cent of GNP at the centre.

A higher revenue deficit especially covering increasing percentage of non-developmental expenditure reflects a lower allocation of resources for capital and developmental expenditure, on 'physical' and 'human', infrastructure and cannot, therefore, be regarded as 'growth friendly'. This has especially happened in India, over the last decades. Indeed the revenue deficit in 1993-94 (RE) is the highest ever reached over last several decades in India. The investment expenditure by the public sector in India has acted as an engine of growth—nearly half of the total capital formation in India has originated from the public sector over the last three decades. Here lies the importance of the level of capital expenditure in the budget. Also, it has been found from the experience of many other countries that when during fiscal restraint the investment activity in the public sector has been made to decline very fast, the private sector in most cases has failed to step in at an appropriate pace and volume.

For assessing the impact of the fiscal and monetary changes initiated by the government on domestic and external debt, this paper has used an analytical model (see the Annexure) very close to the one developed by Stanley Fischer, former vice-president of the World Bank. This model clearly demonstrates that the 'safe' outer limits to a possible debt crisis in the 'current account balance' in the external sector on the one hand and the government's fiscal deficit, on the other hand are very much interdependent and depend largely on growth of exports, real income of the country, real interest rates and the 'source composition' used for financing the two gaps: balance of payment and fiscal deficit. For example, a higher fiscal deficit may not lead to an increase in the ratio of domestic public debt provided the real GDP grows faster than the real interest rate. On the other hand, even a zero primary deficit will increase the public debt ratio if the real interest rate exceeds the real growth of the economy. This point is often overlooked. Thus, in any effort to reduce the public debt, an exclusive concentration in reducing the fiscal deficit, without any proper concern for the growth implications of the government's income and expenditure patterns in the budget and real interest rates, may be self-defeating. Similarly, for reducing external debt exclusive concern on the current account gap in the BOP, and mainly achieved by import compression and aid without consideration for export growth, the exchange rate changes and on other monetary policies is rather ineffective. All these

show that we cannot assess whether a given policy package in the fiscal, trade or monetary areas will aggrevate or ameliorate the debt crisis in deference to the movements of the major real variables of the economy. It is easy to reduce the current account balance in order to reduce debt obligations by slashing imports. Such a strategy may, however, prove to be self-defeating since it may ultimately reduce both GDP growth and exports, especially given the fact that India now needs more imported inputs by way of imports of goods and services and technology to improve her efficiency in production and for faster growth. Similarly, it is sometimes short-sighted to continue with high real interest rates as a tool for demand compression, in order to bridge the budgetary gap, because pursued over a prolonged period this may adversely affect the debt-servicing burden directly through higher interest payments and indirectly by lower growth of the real economy and exports and thereby aggravate the debt burden. Similarly the temptation to reduce internal debt burden by financing the budget with printing notes (interest neutral) has the risk of crossing the 'outlimits' of budget gaps (roughly calculated as 1-1.3 per cent of GNP in India, as given the base scenario); this may expose the GDP growth to high inflation. To take these interacting forces into account, we have used a computable model already mentioned, to assess the impact of the present and likely future policy changes adopted under the reform programme. For this, alternative projections over a ten-year period of relevant debt parameters have been made both in the domestic and external sectors. These projections are made mainly against two scenarios: 'base' and 'optimistic'. Admittedly, it is very difficult to attempt any futuristic projection exercise at this point of time since both the external and domestic environments confronting India are changing very fast and becoming increasingly uncertain.

The 'base case' projections can be regarded as a standard exercise in 'forecasting': The optimistic case assumes a successful implementation of the government's reform measures and a near-fulfilment of their targets regarding major parameters of the economy.

The simulation for the future has been done with the help of the simplified model as has already mentioned. Alike all simplified models it has the ability to cover only the main policy tools in government's debt management in an aggregative fashion. We have also confined to central government budget. This is because the present bout of reform seems to be very much confined to central government's policies.

The model includes eight major policy variables. These are: the level of gross fiscal deficit, the budget deficit, the revenue deficit, the nominal interest rates, external borrowing, the level of current account balance, the repayment schedule of debts and the exchange rate changes. The three major exogenous variables assumed are GNP, export growth and domestic inflation rate. Evidently, the selected policy variables might also affect the three exogenous variables and, therefore, strictly they cannot be treated as 'purely exogenous'. A rough linkage of the changes in the policy variables with the exogenous variables has been done outside the model. The major endogenous variables are debt-servicing liabilities, the growth of public debt (at the centre), real interest charge, and the growth of external debt.

To start with, the central government's actual fiscal deficit in 1992-93 has been taken as the projection base. For 1993-94 (RE) the fiscal deficit has been revised upwards to 7.4 per cent as against the budget estimate of 4.66 per cent.

Base Scenario

The gross fiscal deficit which was very high in 1990-91 (8.41 per cent of GDP at market price) indeed went down significantly over 1991-92 and 1992-93 but unfortunately since then has started rising, reaching 7.4 per cent in the revised estimates of 1993-94 against a budgeted target of 4.66 per cent. For the year 1994-95, it has been placed at 6 per cent of GDP. Still worse is the revenue deficit as percentage of GDP; it has reached a peak of 4.3 per cent of GDP (in the 1993-94 revised estimates) highest ever in the past against a level of 2.63 per cent reached in 1992-93. The inflation rate, measured in terms of wholesale price index has come to 8.30 per cent averaged over first ten months of 1993-94 and estimated to go up to 9.0 per cent by the end of this year. The real GDP growth rate with an initial depth to 1.0 per cent from the base of 5.6 per cent in 1990-91 has increased to 4.55 per cent in 1992-93 (with a GNP growth of 4.9 per cent) and now estimated to come down to 3.8 per cent in 1993-94 (4.0 per cent as GNP growth) by the CSO's advance estimates.

The foreign exchange reserve in this year is the highest since the reform process has been initiated and the current account balance as a percentage of GDP is very comfortable and has increasingly been reduced. The fiscal and revenue deficits have been marginally reduced in this year's budget, i e, in 1994-95 compared to 1993-94 revised estimates. This suggests, as has been explained by the finance ministry, the budget is on the correction course for a once for all slippage in fiscal deficit observed in 1993-94. But at the same time, by judging the heavy upward revisions in the budgetary gaps in the 1993-94 revised estimates, one wonders whether the estimates provided by 1994-95 budget can be accepted with a reasonable confidence limit.

The higher fiscal deficit for 1993-94 (revised estimates) has been explained by the finance ministry primarily by a revenue loss due to lower growth of industrial production and of imports. But detailed scrutiny of the revised budget will show that it is also largely due to a heavy increase in the government's revenue and capital expenditure including nearly 50 per cent increase in subsidy compared to the budget estimates. The question that may come in one's mind is whether this is likely to be repeated in the budget estimates

of 1994-95. The budget for 1994-95 provides a reduction in the income and corporate taxes and also in tariffs. The estimated revenue receipt out of all taxes provided in the 1994-95 budget (after netting any loss due to a reduction in the tax rates) assumes implicitly an increase in the tax buoyancy *vis-a-vis* the growth in GDP by more than 10 per cent (the elasticity has been raised from around 0.87 to near unity). This increase has been explained by an improvement in tax collection. Similarly, in the estimation of customs revenues there has been an implicit assumption of 16 per cent growth in the value of import thereby raising the long-term import elasticity to GDP from near 0.87 to 1.12 per cent and a custom revenue elasticity of nearly 1.2. Judging from the past experience, so larger an improvement in the tax administration and a recovery in the import growth within one year seems to be improbable. Similarly on the expenditure side the claim that the present budget is growth-oriented canot be justified when there is almost a zero increase in its capital expenditure. In the estimate of revenue expenditure there is an assumption that subsidy will go down by 40-50 per cent. Past experience does not give confidence on this promise. The implicit real GDP growth rate assumed to be 5 per cent. This also seems to be an ambitious one, given the prospects of a further decline in agricultural growth. All these taking into consideration, the realised fiscal deficit for 1994-95 may go up by more than one percentage point. This will mean the fiscal deficit target will come back minimum at 7.0 per cent of GNP and the revenue deficit will remain at 4.3 per cent. These new parameters therefore have been assumed in Base Case.

For the future projections in the Base run the potential growth elements in the budget should be looked at from its: (i) Contribution to effective demand, as an aid to bring an industrial recovery; (ii) help in releasing in the supply constraints mainly in the infrastructure areas; (iii) release in the 'capital availability' constraint in the private sector, *vis-a-vis* the need for privatisation, and disinvestments; (iv) contribution in containing inflation; and (v) providing incentives in the growth process; Lastly (vi) the budget's assumption of an accelerated inflow of foreign direct investment and technology should also be examined. The budget for 1994-95 adopted measures to increase the effective demand in the market to help industrial recovery by increasing the purchasing power with the public via reduction in tax and tariff rates. But the effectiveness of these measures is debatable Conceptually, this measure tantamounts to undertaking a balanced budget approach with transfer payments as the expenditure flow. The balance budget multiplier literature in public finance clearly demonstrates that multiplier effect in such cases are unity whereas if this balancing of the budget would have been reached by government increased real expenditure financed by tax revenue, the multiplier would have been minimum two times or more. Thus, there is no clear case that the multiplier impact of this tax reduction will add to effective demand. Regarding the measures for a possible release in the supply constraints, the budget claims an increase in the plan's capital expenditure. However, the empirics show that in current price there is almost no increase in the total capital/plan expenditure and in constant price, i e, in real terms, there have been a decline. Admittedly in two areas, (i) in the social expenditure and (ii) in the rural development, there have been a significant increase by 15 per cent in current prices and around 4 per cent in real terms. This increase although marginal is commendable. But, it should be remembered that both these heads of expenditure are basically in the state sector; however the central assistance to the state plans in the budget is going down. Furthermore, the budget, in tune with the present economic reform justifiably argues in favour of more investment in the private sector at the expense of the public sector. But one should notice that in the budget, an increase in the fiscal deficit has been associated with a lowering of the current account balance in the balance of payment account, as percentage of GNP. This immediately would suggest that there is a heavy crowding out effect going on in the private capital market. Indeed, this has also been observed in 1992-93 and in 1993-94. Further the Reserve Bank's data clearly shows that the lending of the financial institutions to the private sector remained almost stagnant over last two years. This is also corroborated in a sense by the quick estimates of CSO, which shows that there is a declining trend in the propensity to save in the domestic household sector and specially in the financial saving. The real interest rates, besides, are too high, specially for small and medium industries; Its 1 per cent reduction in the budget is too marginal. Besides the effective interest rates for budgetary borrowing is likely to increase because of reduction in SLR and priority lending when the public sector has to provide market rate of interest. Hence in the base case interest rate for public borrowing on the average increased from 10.2 per cent of 1994-95 to 12-13 per cent in future. Similarly the GNP growth rate has been raised only to 5.0 per cent from 4.0 per cent estimated for 1993-94.

Regarding the budget's contribution to the containment of inflation, the verdict is not unequivocal. As our table shows that the budgetary deficit has been reduced from 1.14 for the year 1993-94 to 0.66 for the year 1994-95. This low percentage of budgetary deficit per say cannot be any threat to creation of access liquidity. exceeding the demand for money. However, the experience shows that in 1993-94, the budget estimate has been exceeded by more than double in the

revised estimate. If this trend continues then the anti-inflationary aspect of the budget may also come to question. Although, there is a promise by the finance minister that Reserve Bank will put a ceiling on the level of lending to the central government, it is only hoped that it will be complied with. In 1993-94 with a budgetary deficit of 1.14 per cent, there has been a significant built up of the inflation rate, e g, the year started with around 6 per cent rate of growth of inflation and the year is ending with an estimated 10.0 per cent growth of inflation. In this light, any default in the budgetary deficit target of the 1994-95 budget may prove to be inflationary. We should also remember that government has taken many measures outside the budget which may add to further cost escalation and rate of inflation. However in this base projection an inflation of 9 per cent for future years has been assumed. This itself may seem to be optimistic.

Assumptions behind Two Scenarios

Two alternative scenarios for the future with 1993-94 as base and year 2003-2004 as the terminal year have been attempted. The Base case is very near to a projection which provides minor deviations from an extrapolated trend, based on value judgments. The logic of the assumption of the base parameters has already been explained earlier in this paper. The optimistic case has been developed as a sensitivity case, to assess the impact on the ratio public debt to GDP in India for few hypothetical marginal changes in the central government's fiscal deficit and real interest rate. In the optimistic case the parameters are kept very close to government's own assessment for the future.

The assumptions of Base and the Optimistic runs are given in Table 1.

Results

In the Base case, it is noticed that the public debt as a percentage of GNP will come down from around 57 per cent in 1994-95 to around 53 per cent of GNP at the terminal year. This is indeed a very slow decline. If the slippages in the fiscal deficit accelerates and/or the real interest rates increase faster or there is a further shortfall in the growth of GDP then even this marginal improvement will be jeopardised. Already NCAER has forecast a GDP growth of 4.8 per cent as against 5 per cent growth assumed here for 1994-95 in the base scenario. In terms of the burden of public debt on the economy, it is estimated to go up above 3 times in volume over the decade at current price, in real terms (i e, at constant price) this will mean a more than 100 per cent increase over the decade. Further it will mean an increase in the percentage of interest payment to fiscal deficit from 64 per cent in 1993-94 to 87 per cent in 2003-2004. This suggests that almost whole of the government borrowing will be used only to repay interest (a genuine debt trap criteria).

In the optimistic case, the picture is marginally better. The total debt seems to go down from 57 per cent of GNP to 50.5 per cent in GNP and in terms of ratio gives a rise of less than three times at current price and nearly 70-75 per cent in real terms. Still the burden of the public debt per capita will be more than two times between 1992-93 and year 2003-2004, i e, over a decade.

The difference between the two runs bring out an interesting feature. The key differences in the assumptions used in the two runs are a marginally low fiscal deficit and a lower interest rate in the optimistic case from the Base. The lower real interest rates is made to associate with the optimistic case since there is a general feeling that the real interest rate in India is too high and for this the business and industry are finding difficult to pick up. The result of our simulation shows that any 1 per cent reduction in public debt to GNP ratio over the projected period along with 1 per cent decrease in the real interest rate will result in nearly 1 per cent reduction in the public debt per annum in current price. Therefore, one can infer that a prudent interest rate and an austere fiscal policy will be very much needed to bring down the volume of public debt and its ratio to GNP significantly. Any more slippage in the fiscal deficit will be highly risky.

External Debt

As already mentioned, there is a good deal of debate about the extent of the burden of external debt which India can sustain and whether the present policy changes and developmental scenario are conducive to reaching a sustainable external debt position. It has been already mentioned that the most common indicator of a debt burden in the external sector is the ratio of debt servicing to exports. To address this debt, a similar external sector model has been used (Annexure). The model simulation will provide alternative projections of the above debt service ratios over the next five years under given assumptions. Admittedly any economic forecast for the external sector, given the present uncertain international scenario is much more difficult than one for the domestic sector, as the whole world is undergoing very rapid economic and political changes. Keeping this in mind again two scenarios have been chosen: a 'base case" and "optimistic case". Both these cases are alike in their basic assumptions underlying the two corresponding cases simulated for the domestic public debt analysis. Besides, seven additional assumptions on policy variables pertaining to the external sector have been added (Table 2).

As given in Table 2, an assumption has been made regarding the expected changes in our import elasticity and likely inflow of foreign direct investment.

The optimistic case incorporates very closely Indian government's reform targets like export growth, trade balance as percentage of GNP, projected import elasticity, etc, given in the Eighth Plan document. It also assumes implicitly a gross capital inflow as percentage of GNP almost at the same level as it was between 1984-85 and 1990-91. Besides, it assumes a fulfilment of government's target of a direct foreign investment inflow rising from its low level of $ 800 million per annum in 1994-95 to around $ 2.00 billion at the end of 1997-98 at the present exchange rate. It also makes provision for a repayment schedule to be satisfied for past foreign borrowing as given by the World Bank's latest balance of payments projections. It forecasts perfect

Annexure: Technical Note

success on the inflation front maintaining inflation at 8 per cent over the projected period and a necessary rupee devaluation to maintain the present real exchange rate. It increases the borrowing terms on external debt from 5.3 per cent as in 1992-93 to around 8 to 9 per cent over the simulated period; this is mainly, because of the possible changing composition of the sources of finance. In the domestic sector this simulation assumes, a central government's fiscal deficit declining from 7.4 per cent in 1993-94 to 5.0 in the terminal year. All these assumptions are very close to the official targets. If all these assumptions are fulfilled then this simulation exercise shows (Table 6) in unequivocal terms that the external debt crisis will be over by 1998-99 after crossing the hump of 1994-95 when the debt servicing ratio will reach as high as 31 2 per cent.

This picture is very gratifying. But there are reservations among many economists, given the present pace of economic reforms and their performance observed over the last three years, on the likely realisation of many of their assumptions and their compatibility. The following ones in this context come under heavy scrutiny: (i) The compatibility or consistency between the assumption of a low import elasticity (to GNP at current price) of 1.3 and an export growth of 15 per cent per annum. The first basic question that comes in one's mind is whether the high 14-15 per cent volume export growth is sustainable in India over a decade Because, although in 1993-94 the export growth is expected to be around 18 to 20 per cent in dollar term, calculated from its trend value it would come to hardly 5 to 7 per cent. Besides from the supply side, the basic question that is raised is whether such a high volume growth of export is possible without being backed by high import growth along with increased inflow of foreign technology. Even the historical level of import elasticity in India when the economy was closed and highly protective was higher than 1.4. The experience of most of the successful developing economies under the export led, open economy development strategy supports the view that a high export growth regime almost always go with high import elasticity. Furthermore, the assumption of a net foreign direct investment inflow of Rs 60 billion reaching by the year 1987-88 is reckoned to be very much optimistic. This is because it means, in terms of dollar, it is around 1.5-2 billion dollars. At the moment, the estimate that has been given in terms of foreign direct investment inflow is around 800 million dollars expected by the end of 1993-94. In terms of approval, it comes to nearly two billion dollars. In the post reform period, indeed the approvals on foreign direct investment has registered an average nearly eight times more than average figure observed over 1985-86 and 1991-92. It is indeed gratifying but at the same time reaching a target as high as a foreign direct investment of nearly two billion dollars by the end of the Eighth Plan or an approval nearly 8-10 billion dollars seems to be very much high side.

Keeping all these into consideration a second alternative has been worked out as a base. There the export growth (goods and non-factor services) has been assumed to decrease to 8 per cent per annum in the light of the growing regionalism and the recessionary conditions in the developed world

The optimistic projection also assumes a targeted reduction in the fiscal deficit to 6.0 per cent in the central budget, This target does not arouse much confidence against the present budgetary experience. If, for example, the fiscal deficit in real life turns out to be higher than targeted, evidently then it will have an aggravating impact on the current account balance of the economy. Thus given a fiscal deficit around 7.0 of GNP in 1997-98, a current account deficit of 2.6 per cent of GNP, seems to be more consistent (against 1.7 per cent assumed in the optimistic run). The inflation rate based on all recent indications has been estimated to rise to 9 per cent per annum The foreign direct inflow (disbursement) has been reduced marginally keeping it around 1 to 1.3 billion dollars by the end of 1997-98. The last one seems still to be very much optimistic especially in the light of recent world bank projections where it has been given a net figure of hardly 151 million dollars in 1992-93 together with a portfolio equity flows of 240 million dollars. On these basis, the base run will give an implicit import elasticity of 1.3 over the next five years and 1.24 thereafter. This import elasticity still seems to be on the low side compared to the experience of other successful developing countries which have opened up and adopted on export growth led. The result of this scenario shows that the debt service ratio again will reach a peak in 1996-97 (36 9 per cent) but subsequently will come down next year and afterwards. However after an interval of few years it shows again a slight upward tendency; beyond year 2000. Thus it gives a verdict that Indian economy, given present trends and expectations may just come out of the impending debt crisis but will need a longer time period for achieving this. Thus this simulation results do not give any scope for complacency; since although, the situation is not as bad as in the case of domestic public debt, but to reduce the adjustment period and to bring down the debt service ratio at an acceptable level, the reform process has to move faster. The export growth by no means should be allowed to come down much below the government target of 13 to 15 per cent, the inflow of foreign direct investment has to be accelerated and the inflation should be checked at all cost.

Concluding Remarks

The above simulation exercise clearly shows that the concern of high public debt burden in India is very genuine. The present economic reform has both its aggravating and ameliorating Influences on the public debt. But given its present pace and slow success, it does not provide a promising picture. According to present assessment public debt as percentage of GNP in India is not likely to show any significant declining trend when almost the whole of government's fiscal deficit (i e, borrowing) will be eaten up by interest payments on the public debt. To avoid such an outcome a serious effort need be made by launching a fast disinvestment programme of public assets, for achieving a significant reduction in the existing public debt. Also in immediate future the government's high interest rate policies and the slow pace of deregulation of interest rates will have to be reviewed and their adverse effect on public debt has to be minimised. Last and not the least it should be recognised that the present fiscal discipline should continue and accelerate in pace maintaining and reviving its growth friendly nature and reducing as much as possible the unproductive revenue expenditure. Of course the present fiscal reform must now percolate and get reflected also in the state budgets.

In the external sector the prognosis is comparatively better. Even admitting many of the observed defaults and shortfalls in the reform measures and their impacts, the prospects of coming out of the so-called debt and balance of payment crisis which surfaced in 1990-91, are bright, although it may turn out to be rather slow, a long correcting process. But to sustain the present climate of economic reform and its actual acceptability, all efforts should be made to speed up the reform process and its implementation to achieve the desired results. This will need primarily by (i) achieving high import and export growths; (ii) increased foreign capital inflow mainly in the form of direct foreign investment which has no debt obligation; (iii) maintaining the real exchange rates; (iv) pursuing prudent interest policies; and (v) a careful mixing of the sources of borrowings. Last of all, an articulate foreign exchange reserve policy needs to be maintained keeping in view the characteristic features of inflows and outflows of portfolio investments from the experience of other countries. The final lesson is that exclusive concentration on only exchange rate or balance of payment policies will not solve India's debt crisis if these policies are not supplemented by appropriate 'supply side' economies.

Teaching Women's Studies to Male Engineers

A Personal Account

Rehana Ghadially

This article examines a decade of teaching a Women's Studies course to a virtually exclusive male audience at an elite engineering institution in Bombay The emphasis here is on student reaction and contribution and how the course content evolved as a result of this. The article also highlights the responses of the women students in class, the highs and lows of such a course for teacher and students and whether teaching Women's Studies is a fruitful exercise in terms of its impact on the students

and the women of India will not attain their full rights by the mere generosity of the men of India They will have to fight for them and force their will on the menfolk before they can succeed (Jawaharlal Nehru, speech at Allahabad, March 31, 1928) (quoted from Jayawardena, 1986, p 73)

'N the early 80s the National Conference on Women's Studies (NCWS) in their review of curricula in different disciplines highlighted he virtual absence of women in the Social Sciences The small beginning that had been nade included the SNDT Women's University's attempt to introduce a paper on 'Sociology of Women' as part of its undergraduate programme. It had also introduced a course on 'Women and Development' at the MPhil evel Bombay University was also planning o introduce a similar course in Sociology Sophia College, Bombay in its "open classroom" programme discussed women's ssues The NCWS noted that the omission of women's concerns from course content in academic institutions was depressing and ecommended the incorporation of these with he general courses (Report of a meeting of experts, 1983) Besides these, two other beginnings not mentioned by the report had been made One in the department of social work at the Tata Institute of Social Sciences which offered an interdisciplinary course titled 'The Situation of Women An Overview' for the first time in the academic year 1983-84[1] and the other a course with a feminist perspective titled 'The Psychology of Sex Differences' (about which more follows) offered for the first time in the Dept of Humanities and Social Sciences (H and SS) at the Indian Institute of Technology (IIT), Bombay in the academic year 1982-83

By the late 80s things had begun to move nd over 100 universities and five centres xpressed special interest in this subject and were seeking University Grants Commission, Indian Council of Social Sciences Research and the Ford Foundation special unds allocated for the subject [Patel 1987] Within the next few years seven universities n the country introduced Women's Studies n the curricula for undergraduates with the aid purpose of changing society's attitude owards women's role and rights. Plans were lso under way for an intensive training of the university college teachers and drafting of a textbook for undergraduates [*The Times of India* 1990] The strategy for the rest of the Seventh Plan period included the development of at least 10 more resource centres over the country According to Patel (1992) Women's Studies is going to be introduced in more than 100 universities of India in the next five years

By way of comparison, by the mid-1980s there were more than 400 programmes of Women's Studies and more than 4,000 courses offered on American campuses In Australia, five universities offered majors in Women's Studies in 1986 but every university offered at least some courses in this discipline [Bulbeck 1991] Historically, the British women's movement has been deeply hostile to and suspicious of institutionalised study Women's Studies has flourished in part-time and non-vocational courses, in adult literacy and access programmes As a result, it has remained on the edges of educational power Those Women's Studies courses that are in higher education are often options within otherwise traditional departments [Humm 1985] In Canada, Women's Studies was almost non-existent in 1970 but during the decade any college department that held even a tenuous claim to relevance had at least one Women's Studies offering in its calendar Many of the early courses were primarily directed towards female students and functioned essentially as consciousness-raising groups but over time the focus began to alter and the concern with process was taken over by an increasing preoccupation with out come or issues of policy [Lightman 1978]

The Course and the Context

As these courses and centres increase in number in India, they will inevitably add a new dimension to the women's movement by bringing new learning and sense of discovery to the college and university campuses In this paper I share some of the teething pro-blems, my own reflection and reaction, reaction and feedback from students, and what one should expect from teaching courses with a feminist perspective to male students especially of physical sciences and engineering disciplines In the academic year 1982-83 I offered an elective course titled 'The Psychology of Sex Differences' in the Humanities and the social sciences department at the Indian Institute of Technology, Bombay in the second semester (two semesters per academic year) of the fifth and final year undergraduate science and engineering students as part of a required H and SS elective The course competed with several other courses from the disciplines of literature, philo-sophy, sociology, psychology and economics By the mid-80s, considerable academic restructuring took place in the institute as a result of which the five-year programme became four years and the H and SS elective became an institute elective which means this particular course was offered in the second semester of the fourth year as an institute elective and it now competed with electives offered by the H and SS as well as the science and engineering departments An undergraduate course at the institute runs approximately for 14 weeks and meets three hours a week, 55-minutes per period In the last two weeks of instruction a formal course evaluation is conducted by the institute, followed by a short study break and exams.

When I started teaching this course I had no formal training in Women's Studies courses The course materialised partly due to my own interest and partly because of the flexibility allowed by institutions like the IITs that give an instructor near total autonomy over the introduction, design, running of the course and final assessment of the students. Autonomy however need not be confused with support Despite the ethos that the Humanities and Social Sciences departments were started to give science and engineering students some input of liberal arts courses these institutions particularly approve and reward the so called service-oriented' or 'relevant' courses such as management, organisational psychology, language and writing skills, etc

The course under varying titles ('Psychology of Sex Roles' 'Psychology of Gender Roles' and soon to become 'Gender Roles and Stereotypes') with varying course content, teaching methods and students assessment techniques, has now been running for a decade The variations reflect experimentation and gradual evolution of the course, availability of resources and literature, the

personal and academic growth of the instructor and sensitivity to student feedback While the predominant emphasis was on 35 minutes lecture followed by 20 minutes of discussion, classroom learning also included at least one or two of the following group/individual exercises, group/individual class presentation, outside speakers, films, distribution of reading material and group/individual assignments Throughout the teaching of these courses a feminist perspective was maintained and such a perspective necessarily acknowledged oppression on the grounds of caste, class, creed as well as gender The number of students enrolling for the course per semester varied anywhere from six to 35 In the past six years women constituted 20 per cent (the overall male to female ratio at the institute is approximately 10 to 1) of the class

My motivation for teaching the course also underwent some change In the beginning I taught the course due to personal interest and inclination that it would force me to develop knowledge and expertise in the area Keeping with the original ethos of the department I wished to sensitise students to contemporary social issues and the course footed such a bill Besides a few years of teaching and living on the campus had made me aware that scientists and engineers are a socially conservative lot and it would be interesting to see how such a course is received by the students Along the way, I had nobler motivation such as getting male students to be sensitive and supportive of younger women who were aspiring to bring about changes in their lives, trying to carve out a new identity for themselves The classroom feedback was to erase some of these nobler ideas from my head Two sets of goals would probably characterise my current motivation and that is the traditional academic one of giving students substantial amount of information and the less traditional one of personal change and a new political understanding While there may be some tendency for receptive students to choose gender studies course and 'non-receptive' students to avoid it, this seems unlikely as classroom experience has shown that students are hardly receptive Besides their reasons for taking the course do not reflect any such receptivity Their motivations include interest in psychology prefer objective exam paper had taken introduction to psychology with you On the other hand they may be 'more receptive than others because neither my declaration on the first day of class nor their knowledge passed through the student grapevine that the course has a feminist bias has driven them away

The first time I taught the course (Psychology of Sex Differences) 14 students—all male—registered from a total of approximately 280 students The topics covered included sex differences/similarities on personality variables such as self esteem achievement need, performance expectancy, attribution and evaluation and cognitive variables such as intelligence and creativity The classic text by Macoby and Jacklin called 'The Psychology of Sex Differences' was followed The main purpose of the course was to highlight that with the exception of a few areas there is little experimental evidence to show that the two sexes differ on personality and cognitive variables and much of the observed difference is the result of social and cultural conditioning rather than biological factors When the formal course evaluation came in, the overwhelming response was that the course was interesting However, I was not quite happy on three major counts Firstly, I wanted to include some component of exclusive women's issues and concerns Secondly, in order to be more comprehensive it was important to teach gender roles from an interdisciplinary perspective Thirdly, I wished to minimise my reliance on western literature Ideally, I wanted to teach a full-fledged women's course such as 'Psychology of Women' or 'Women and Society' But offering such a course filled me with anxiety I was afraid that too many students might take it thinking that it would once and for all answer the question that Freud asked and could not answer viz What does a woman want?" On the other I feared not many students would register driven away that a course with an emphasis on women was not relevant for them

The second time around I made some changes The course content had some emphasis on women's issues, was more interdisciplinary and included some information on India It now included topics such as portrayal of women in the media especially advertisements and commercial Hindi films and school textbooks, the use of sexist language and violence against women especially rape and wife-beating Thirty male and five female students registered The change in course content generated greater participation from the students I found the classroom discussion charged and interesting and decided to maintain a diary of what transpired in class At the end of each class session I would write down verbatim what had happened This diary was maintained for three years, there-after for the next three years I jotted down some general impressions of class happenings This paper is based on a variety of data Besides the diary material and record of general impressions there was course evaluation material student questions and remarks outside the class, ex students visiting the campus and providing feedback

Resistance and Power

The predominant atmosphere of the class was characterised not surprising of course by resistance There are a variety of ways by which students resist and undermine women s issues and concerns There is a reluctance to embrace information by trivialising it, ignoring and denying it, and explaining it away The Indian Constitution guarantees equality, they state, so whatever inequality or discrimination that exists must be either their own doing or their lack of ability In other words if women find themselves in a secondary position in society they are themselves to blame Another way of resisting change was to state that before bringing about any change we must look into the matter very carefully, must give more thought to it Added to this was the dimension that before thinking of change due res-pect must be shown for customs and traditions as they have served an important function in society

Suggestion for any kind of change, say for example, changing sexist language, frequently brought a retort that this would result in loosing support for the women's movement or that it is trivial and the women should pay attention to bigger and more powerful forces such as changing child-rearing practices In their more optimistic mood the students would agree that social change is definitely needed but "Is the time ripe for change?" or "Are we ready for this kind of change?" Still another way to undermine the women's movement was to label it as a western import with its stigma of sexual liberation and family breakdown Indian women—the vast majority of them—are quite happy playing second fiddle to the men and limiting themselves to the domestic sphere The efforts and energy of the women activists are trivialised and students take the position that no matter what one does nothing really ever changes If their efforts are acknowledged their action is perceived as not having produced the needed results Rape figures in the west and dowry deaths in India they state, have not fallen, despite all the efforts of women activists and the government They would quietly ignore any suggestion that these could also be the result of more women coming out and breaking the silence surrounding these taboo subjects Most often resistance is displayed by immediately positing a point of view opposite to the one stated by the instructor and polarising opinions on an issue thereby pre-empting any meaningful discussion For example figures on wife-battering are counteracted by the comment that women also nag their husbands The actual complexity of the situation is simply not grappled with Still another way of resisting change was not to acknowledge gender power inequities altogether and instead pose the gender question or rather the gender relation problem as one of lack of love and understanding and a good dose of both would sort out all gender issues Another powerful technique was to withhold male support for any change that brings benefits to a category of people different from them These young male en-

gineers will neither be supportive nor provide constructive suggestions as to how best to bring about change, equality and justice in society. An infrequent tactic was to deflect attention. Women's issues are important but what is more important are some other national concerns such as corruption, poverty and population.

The fundamental challenge for the students is the thought of having to share power and the vast majority of students are privileged in terms of not just gender but also class, caste and creed. The course in a marginal way addresses to other kinds of power inequities in society besides one based on gender. And for the teacher the best place to set an example is to begin with power relations in the classroom. No matter how much we may deny it, the basic structure of classroom is unequal. The question of reducing the imbalance here should be our immediate concern. And unless we as teachers do it the question of power imbalances being addressed in the wider community will remain a dream. An attempt to maintain a personal relationship with the students characterised by sharing of power created some alienation. They would say an egalitarian society is impossible. Power groups will emerge no matter what. Western nations dominate third world countries, do not they? A hierarchical society is more efficient and Indians by and large understand and are happy in hierarchical relationships. Unless, we are coerced, we might do nothing. As a concession they grant that perhaps gender equality may be possible but class, creed and caste equality is not. A talk about misuse and abuse of power would result in the granting of some cosmetic concessions. Perhaps the most threatening aspect for me to face was the students' feelings that if an individual and/or group has power—whether economic, political or physical—he is justified in using it. One has to help students open their eyes to society, its institutions and their power and gain new perspective and encourage how they can effectively and responsibly change their own lives and society. One has to redefine power as not so much control over others but as existence of choices as having control over these choices in one's life and over one's own destiny. A feminist definition of power is a must for women's studies classes.

Is it Really that Bad?

While this may be the response of the majority of the male students, there are some students who contribute in constructive ways. So much heat is generated partly because participation and discussion is encouraged as this is more effective in generating attitude change. Many times it was obvious to me that they argued for the sake of argument and not for the purpose of defending an ideology. They did not wish that I get away easily with what I said. In the competitive atmosphere of the institution there is an unfortunate tendency among students to turn learning situations into win-lose situations. This prevents meaningful discussion and the much needed attitudinal change Despite their volley of arguments there is a geunine desire on the part of students to understand themselves better and get some insight into how women feel and think though interest in feminism *per se* is secondary. Besides, the responses of the students can be partly understood in terms of the ethos and values of the student sub-culture. In the words of the students themselves this ethos is "sex and success". In the last three years a new elective was introduced titled "Stocks and Shares" and one-third of the fourth year batch of students have been attracted to this single course. The students say, it teaches you to make money and that matters. Pande (1993) in a recent survey found that the engineers prefer to be bureaucrats and on the whole find power and prestige too charming to resist. The students at the institute perceive the pie as finite and there is a race on to get the biggest piece for themselves and in order to win there is nothing wrong in pleasing whatever the powers be. Self-res-pect and integrity are small casualties in the pursuit of success. While the ethos of competition and material success may be exaggerated on IIT campuses, a number of news-paper articles make it clear that a similar ethos exists in other academic sub-cultures and I quote: "Today's collegians do not find it necessary or convenient to go through their activist or socialist phase They are too busy worrying about 'making it' and 'going places'. The preferred place of course being the boardroom". "Today's young admire the wealthy and the successful business person rather than the rebel who fights the system. In fact, most are inclined towards jumping into the system instead of revolting against it".[3] Aggressive, hardworking, and bursting with self-confidence, India's new young go getters are elbowing their way up corporate and professional hierarchies".[4] The educational system with its emphasis on rote learning, its status quo philosophy, has not encouraging self-exploration and self-examination and cultural critique. The atmosphere is one of competitiveness, being objective rational, formula based as opposed to what the course emphasises solidarity, communication, feelings, experience.

Protestations and insensitivity notwithstanding, the bottom line is that these students are intelligent and the learning and debating process in class resulted in students suggesting the possibility of more success if the gender problem is handled from a different perspective. Although, it is a male pers-pective it is worth giving a thought This perspective can be approached in terms of a number of specific contributions that the students made to my own academic growth and rethinking on matters dealt with in class. Firstly, there is the near total emphasis on the negative consequences to the victim that are highlighted in class. If change is to be brought about one will have to show how access to power corrupts, brutalises and dehumanises the powerful, besides just debasing the victim. If the impact only on the victim is highlighted then everyone will want power. This contribution still needs to be incorporated in the course. Secondly, the emphasis of the course is on distorted gender relations on what has gone wrong and the course does not emphasise what constitutes healthy men-women relationships, love and intimacy. This suggestion has been incorporated in a marginal way. Lastly, in order to strike a balance it is important to do justice to the men's role and experience partly (remember it is a gender role and not women's role course). For some years, I had avoided the topic partly because there was no literature available to me and because I was (and still am) convinced that women's problems need and deserve our time, energy and resources. But try convincing this to a male audience and you will know what you are up against. As a sample comment one student noted on the course evaluation form "Be more sympathetic to the men's point of view and try to be less radically feminist. Try to present a more unbiased view of gender equality." Another comment read "Somewhere along the way we deviated from sex roles to women's liberation studies. This was avoidable." Given a largely male audience I could understand that men's concerns were important to them and I defended myself by stating that the men had not started articulating their problems in the same way as women had. As this turned out to be their major concern I did make extra effort to search for material and was eventually able to get enough information to give a few lectures on masculinity, male role and the American men's movement.[5] Some of the literature was coming from psychology definition of masculinity and the nature male experience) and a more issue-based information was coming out from the men's movement. Incorporating this material in the course resulted in the prompt comment by one of the male graduate students in the department and I quote "I hear that of late you have been paying special attention to men's problems too in your class. I would like to say that I feel that this is quite a good thing. Unless we can unearth how both men and women are trapped in their roles, we cannot hope for a better understanding between the sexes."

Highs and Lows

There are positive and negative aspects both for the students and teacher of such a course. On the student side, the positive aspect is the great deal of participation and discussion allowed which by virtue of the course content is not possible in other cours-

es. The course content facilitates introspection and self-exploration, opportunities hardly provided by engineering curriculum. This provides them with an alternative experience based on emotions, subjectivity, communication to existing objectivity, rationality and one answer-based pattern so pervasive in institutions of higher learning. The positive side is best exemplified in their own words which appear in the formal course evaluation. "From this class I have learnt that women are not just sex objects but persons too." "The guest lectures were interesting and perhaps more could be organised."

On the negative side, the student find course material quite threatening. They experience anger, discomfort, guilt and anxiety in the face of gender issues. Despite allegations that feminist courses are soft options, their reaction only reveals how vital and close these issues are to their hearts and lives. Though this was not the intention of the instructor, the male students sometimes felt, especially when issues of violence were discussed that they are being held responsible for the injustices and atrocities committed against women. They complain about feminist bias and some repetitiveness in the course.

The positive aspect for the teacher was the opportunity to raise consciousness—theirs and mine, open students' eyes to existing inequities, the course's potential to reveal to these men some of the apparent contradictions with which they live, the challenge posed by student questions, learning to take control not of them but of myself. Another high is satisfactory class attendance and enthusiasm. On the formal evaluation form 80 per cent of the students rated the teacher as either "good" or "excellent" on "instructor command over the subject" "presentation" and "overall organisation". This was indeed empowering. The students questions on Indian men and women led to a search for material which I finally edited in book form published in 1988. In this class I share more about myself as a person and students relate to me as a person, not just as a professor. This is also a positive for the students. On the negative side dealing with students' emotions and knowing that it interferes with the learning process, the hostility from class members, not having enough women in the class, the fact that students cannot look beyond themselves and their own needs, scrounging for limited literature, emotionally draining as the classroom is turned into a mini battlefield, that verbal facility is more crucial than supporting evidence to win one's point. There is an enormous amount of time and effort required to develop and experiment with the course content. There is a need to re-prioritise the course contents. Science and sexism, feminists critique of technology are issues that need to be addressed. The need to transform the wider institutional context via issues such as sexual harassment, pornography have yet to be addressed. The negative aspect of the course on the teacher can also be gauged by the remarks of the invited speakers to me and I quote "Uphill task ahead of you", "Highly conditioned lot", "argumentative", "deep into myths", "insensitive". Being a single woman compounds the difficulty of teaching such a course. Complaints against men and my perception of gender problems are chalked up to my own frustrations and unfulfilled needs.

The girls as expected are more supportive but unfortunately considerably less vocal. All attempts to encourage them to speak up in class produced meagre results. There are many reasons for this. The course content does not challenge and threaten them in the same way that it does the male students. They are diffident because the class is male-dominated. To quote one woman student "A boy will answer a question somehow, even if he makes a fool of himself. A girl will answer only if she is sure so she often ends up saying "I don't know" This is due to a fear that I will make some shocking gaffe and the whole class will laugh since in any case I am not sure of classes friendship, this is something I don't want to risk." The class merely mimics what happens in the wider culture namely that they have been silenced and will need considerable prodding before they will be willing to speak up especially aspects of their lives close to their heart. There is an unstated dread that the men will not be able to receive and understand some of their personal feelings and experiences. Some state that they simply do not wish to get into an argument with the boys. To quote the same woman student "Another thing one really cannot afford to do is to get into a fight with a boy... The grapevine, among the guys is of really formidable proportions, and before you know it half the institute will know that so and so can't stand such and such a girl." A few women have stated that I am already representing their point of view and I tell them this is every woman's battle and not mine alone. Some of them are too conditioned to want to rethink though some of the issues discussed in class and others function under the myth that they will not be objects of many of the things stated in class especially rape and wife abuse. To quote a woman student, "I have rarely come face to face (on the campus) with the really unpleasant vulgarity which I know exists." These young women to use Gloria Steinem's words "have not yet experienced that marriage is not an equal partnership, that equality of opportunity does not exist in the paid workforce, that having children is no easy matter" [Bulbeck 1991 p 34]. All these justifications do not bypass the fact that there is a need for young educated women to speak up and be heard and it would be particularly interesting to know how women's studies courses are received in all women or majority of women classes. Academic institutions differ in the nature of student enrolment, the kind of atmosphere they provide for change and it will be wise to study and share what other instructors come up with or come up against.

Is Women's Studies Wasted on Science and Engineering Students?

There is some evidence to indicate that gender studies courses do have an impact on the students. Gerald and Jacklin (1988) found that after an introductory gender studies course students regardless of their gender, religion, ethnic class and religion categories, sexism towards women scores were significantly lower compared to controls and significantly lower than their own levels at the beginning of the semester. Brush et al (1978) on the other hand found that as in most courses some students are profoundly affected but they constituted a tiny minority. They go on to say that the programme may create latent changes, not immediately evident, but which manifest themsleves at some time later.

My own experience suggests that there is both an immediate and delayed impact on the students and this is best manifested in the formal course evaluation. Here is a sample of what they have to say; "It has made me re-examine my role as a male. It has helped to become a better human being in my interactions with females." "By challenging male-oriented values, the course made me think hard. It has shown me a different and better way to relate and has left me with no option but to follow that". "The course should be made compulsory for all students, so that every year, 250-300 individuals will have a better approach to women. Isn't it great, because they are likely to pass the tips to others".

One woman student wrote: "The course has made me realise my worth in society as a woman. There are so many things that we know, we read in the papers but never stop to think. That these can affect us. I suppose this course will help me realise my potential as an individual rather than as a woman. I also hope that it has made the boys from my class aware of what injustice is being done to their opposite sex unconsciously and consciously. In a way I think the course has made me more insecure, I was living a comforatable life without thinking of the problems. I have now become aware of them."

It is also heartening to know that this immediate impact is not washed away as evident from a delayed reaction. A good number of students in the class go to the US for post-graduate studies. One has sent a year's subscription of *Ms* magazine. Another sent clippings on feminism from a local Florida newspaper. Still others have come back to say how much the course affected them and how much they have changed as they see western women participate in all walks of life. One bought my edited book to give as a gift to his wife, who was also a student in class. The same woman student is

involved in doing voluntary work at sheltered homes for battered women in the US. The impact of the course is seen in other small ways. On the evaluation form, where it says instructor's name I become Ms instead of Miss. On the same form there is a question which reads "Was the instructor accessible outside the classroom for clearing doubts (1) yes (2) sometimes (3) never (4) I did not try to contact him". The students change the *him* to *her*—something that I do not see on the evaluation forms of other courses that I teach.

Concluding Remarks

By way of conclusion, it is comforting to know that the academic institutions have taken the initiative to provide the means to reduce sexism and take up the challenges faced by the women's movement. As elsewhere, the students most likely to receive this new input will be predominantly women and to that extent we will be accomplishing only a part of the task ahead of us. If conscience is to be raised, they should be raised for everyone. For teachers dealing with an almost exclusive male audience, it is important to learn and highlighted how men can be helped to develop an empathic attitude towards women in general and to respond in positive ways to the challenges thrown by the new women. Women's Studies is about social change and while we focus on hierarchical gender relations, we must also engage in highlighting and abolishing inequities based on class, caste and creed. The task before us is to produce and disseminate the knowledge that facilitates this transformation.

DISCUSSION

Mainstream Perspective on Nagas

Sajal Nag

THE tribals of north-east India write very little about themselves. A proper comprehension of the situation in north-east India has therefore to be based on the understanding provided by rank outsiders which has its own limitations. As a matter of fact, the available scholarship on north-east India can be divided into four categories—researched, journalistic, administrator's views, and perspectives based on any one of the above. Scholarship does not perhaps suffer due to this but north-east does especially when an insight into the situation in north east India is sought to be provided on the basis of second-hand materials. V R Krishna Iyer's 'Saga of the Nagas' (*EPW*, March 19), which belongs to the last of the above categories, does exactly the same. His essay has been entirely based on a former administrator in the north-east, Murkot Ramunny's recently published book *The World of the Nagas* (Northern Book Centre, New Delhi). Administrators come to north-east India either on punishment posting or on compulsory difficult area posting, as representatives of New Delhi to carry out the policies which they subsequently find fault with.

Iyer's essay is significant because it is highly reflective. A deconstruction of its structure, form and content reveals that for all his sympathies to the Naga cause, he lacks basic empathy. Despite his consistent condemnation of the policies followed by the Indian state *vis a vis* the Nagas, he favours the dominance of India in the Indo-Naga bilateral relationship. Behind his liberal garb, there is a 'mainstreamist' who is scared of secessionist tendencies in Indian polity and advocates "mainstreaming" the peripheral marginal communities to avoid any prospective disintegration of India.

Dominance-Marginality Equation

Throughout the essay Iyer uses expressions like 'handling the Nagas', 'lack of unitive statesmanship with federal liberalism', 'ineptness in the art of persuation', absence of political sagacity and sensitive statesmanship', etc. In other words, for Iyer the initiative always lied with the Indian state—the dominant partner of the two. The Nagas only reacted, therefore the credit as well as the blame in dealing with the Nagas inevitably went to the Indian state. The Naga's resolute struggle was not considered any force at all. Iyer regrets that "if the men with vision in Delhi and Kohima had handled the Naga affair at the historic junction with delicate care and foresight, India-Naga relations could have been a lovely chapter, not a chronicle of intrigues and underground operations". He then goes on to blame the "woodenheaded response of the Assam government" for the deterioration of the situation in the Naga hills. For all his liberal intellectual credentials, Iyer still stops short of blaming the post-colonial Indian state for not respecting the democratic aspirations of a tiny tribal population who desired to seek their destiny outside the hegemonic reach of India. Jai Prakash Narayan advocated that the Nagas should be let free as per their desire so that we have friendly Nagas as our immediate neighbour rather than an unwilling, unhappy people forced to be our partners. But like the Indian state, its dominant intellectuals also scorn the idea.

Mainstream Syndrome

While posing to be a champion of the Naga cause, Iyer discredits the "arrogant Moghuls of North Block" for not being able to "mainstream the Nagas", without qualifying his expression. He does not bother to define the concept of mainstream nor outline its conceptual frontier. For him it is a given. Iyer thus lets the cat out of his bag and allows his subconscious mainstreamist mind to take over. For him "the Nagas are integral to the Indian Union". So perhaps are the Kashmiris, the Sikhs, the Tamils, the Mizos or the Assamese.

If India fails to 'handle' the Nagas, it would be bad precedent—detrimental to the liberal, secular and pluralist image of India which the state and its intellectuals have so carefully developed. It does not matter to them at all whether the Nagas consider themselves

integral to the Indian Union or not To them Nagas do not have a view after all, it were the "foreign missionaries who fostered the idea of independence among the Nagas" The basic problem that generates and perpetuates the crises that modern India confronts is this mainstream mind and its consciousness structure Neither the men who rule from Delhi nor Iyer is free from this syndrome

Foreign Hand

It is amazing how an idea floated by the Indian state in the early 50s that it was the foreign missionaries who instigated the Nagas to seek freedom from India continues to rule the roost despite researchers proving it otherwise The idea was first coined by the Assam government which was accepted by the ministry of external affairs as true' in the absence of any other scapegoats Even Nehru asserted when a memorandum was presented to him by the Naga National Council (NNC), that it was drafted by an outsider, blaming the missionaries by insinuation It was not conceded that the Nagas could write a memorandum themselves Among the ranks of the NNC was a man called T Sakhrie, who had an excellent command over the English language and was a fine orator, who had drafted most of the memoranda submitted by the NNC H K Barpujari, doyen of historians in north east India, while dealing with the issue stated "that the foreign missionaries had a secret hand in these movements, conceived even at responsible quarters, is a misrepresentation of facts no impartial observer can pass a verdict on the subject without a study of the correspondence that passed between the mission and their higher authorities in the US and UK apart from the archival sources available in India Without the material and moral support of the authorities the foreign missionaries were well aware that they could not carry out their main objective namely, proselytisation Therefore they remained steadfastly loyal to the government—British and Indian A perusal of the mission papers in original of the American Baptists has convinced this writer that they hardly dabbled in politics From mission offices repeated denials of their hand in secessionist movement was also issued But neither the state nor the intelligentsia believed either the historical research or the denials from missionaries They had reasons to be unhappy Michael Scott, a British missionary, was invited to mediate between the Indian state and the Nagas and was involved in the Peace Committee But contrary to the expectations of the state, Scott favoured the Naga cause and even attempted to internationalise it He was promptly shown the door The missionaries who replaced the foreign missionaries in Naga hills have been our very own—mostly south Indian men whose conduct should not be suspected Of course there are Naga missionaries who are champions of the Naga cause But if the Nagas have their own Bishop Desmond Tutu, they cannot be blamed "

Falsifying History

Trapped in the straitjacket of colonial anthropology, Iyer tries to introduce the Nagas by using anthropological cliches like 'a fine race 'honest people', 'cultured and gentle with a sense of independence and obliteration , and surely does not fail to add that they are "Christian *but Indian*" Self contradictory and rampant value judgments are allowed to flow characteristically The Nagas are said to be neither "soft stuff" nor "violent people ' At the same time, they are described as head hunters whose society has been torn apart by inter tribal violence Such a society is again described as "close knit' In his attempt to explain away the Naga struggle, Iyer finds long period of insulation to be responsible for generating xenophobic tendencies among the Nagas The recorded history of last seven centuries of the Nagas shows that they had full fledged interaction with the people of the Assam plains The Nagas lived in a place remote from New Delhi but not from Assam valley or Bengal plains As such, they did not live as isolated a life as is believed Again, it was not the Nagas who feared or mistrusted the plainsmen but the other way round In the famous memorandum submitted to the Simon Commission by the Naga Club, the Nagas took pride in the fact that they were a terror to the plainsmen for the raids and head hunting invasions into the Brahmaputra valley The British policy of non-interference was only a rhetoric which was never practised Researches in north-east have already exploded the myth It is high time we stopped exploiting the cliches which are historically incorrect and only provide a rationalisation to some of our own preconceived premises In perpetuation of another myth, Iyer repeats what Nehru had floated in the 1950s that Nagas resisted merger with India as they did not experience the sensation of being a part of the Indian freedom struggle The Nagas fought against the British for as long as a century The movement led by Jadonang-Gaindinliu repeatedly used the name of Gandhi to mobilise their supporters T Aliba Imti, the founding father of the NNC, in his memoirs candidly indicates that he and his colleagues who formed the Naga intelligentsia were aware of the developments in the rest of India Phizo himself was reported to have joined the INA when it entered Imphal through Burma It was the Indian nationalist movement which stubbornly refused to acknowledge the anti colonial struggle of the Nagas as a part of the Indian anti-colonial struggle and not vice versa

It is also a historical fallacy that it was Phizo who united the Nagas Long before Phizo arrived on the scene, the NNC was formed with the avowed objective of unifying the diverse Naga tribes It accordingly had a membership drive in all the Naga tribes and sub-tribes Similarly, it was the NNC which demanded the right to self-determination right from the beginning, not any particular individual The acceptance of the nine-point agreement was only a temporary measure to prepare the Nagas in self-rule But the clever use of words and interpretative manipulation, coupled with the threat to use force, made the Nagas back out from the agreement It was not just Phizo but a large section of NNC members who resented the last clause of the agreement In fact Phizo came into prominence only in the 1950s when the Indian army entered the Naga hills and vindicated the apprehensions of the Nagas. At one time, Phizo was relegated into such insignificance within the NNC that he left the organisation to form a parallel one called Peoples' Independence League whose failure brought him back to the fold on NNC again

Divide and Trivialise

The Indian state tried to counter the Naga struggle by dividing the Nagas by such descriptions as moderate and extremist Nagas Iyer does something similar He uses the description 'Naga Indians' for those who reconciled with statehood The acceptance of Nagaland state was neither the work of any group called Naga Indians (no such category exists) nor the result of the realisation of the futility of waging war against the Indian might It was only a middle path adopted to usher peace in the hills The Nagaland state was only a temporary arrangement, not the destination of the Nagas Too much also should not be read into the participation of the Nagas in the parliamentary elections because the same Nagas had effected a total boycott of the 1952 election Iyer's description of Phizo's announcement of Free Nagaland as "infantile adventurism" betrays his subconscious arrogance so characteristic of the mainstream mind Such trivialisation of the Naga struggle is uncalled for Phizo's struggle has not been in vain as Iyer suggests At least not yet The Nagas have to "look to London, New York and Peking" for a solution to the Naga issue, he says After all, the headquarters of the UN is in New York Similarly, London and Peking can help create international pressure on New Delhi to help the Naga cause

Colonial rule has left behind an indelible imprint on colonial societies Post-colonial societies are perpetually plagued by phenomena like communalism, separatism, secessionism, civil war, military coups, and so on But what we can ill-afford is a colonial mind, especially at a time when, to use Iyer's lines, "nationalities the world over are sensitive to cultural autonomy and demand for self determination by secessionism" The first prerequisite of liberalisation of outlook is the decolonisation of mind Before we declare ourselves a nation, as Iyer has done, we must resolve the tangle, to use Iyer's words again, between 'we' and 'they'

LESSONS OF THE SUGAR MUDDLE

AGA KHAN RURAL SUPPORT PROGRAMME (INDIA)

The Aga Khan Rural Support Programme (I) is a renowned Rural Development organisation which appreciates the importance of specialised skills, professional management and adaptable technology for improving the quality of rural life. Functioning in three districts of Gujarat, AKRSP (I) seeks to empower rural communities to develop and manage natural resources in a sustainable manner, through a process of organising rural people into viable self sustaining institutions. For the posts described, we encourage women candidates to apply.

EXECUTIVE PROGRAMME COORDINATOR

He/she will be required to coordinate a small team of Programme Executives/Managers with the intent of providing guidance and direction to a complex development programme.

The ideal person should be a Management graduate or a Master of Social Work with about 5-7 years experience in a responsible position in a rural development organisation. He/she will be expected to travel extensively and monitor programme implementation. He/she will also be a key representative of AKRSP (I) at various workshops and symposiums and depute for the Chief Executive

HRD/ TRAINING MANAGER

The primary responsibility will be to clearly define job descriptions, roles and responsibilities of AKRSP (I) staff and subsequently meet the training and development needs of the institution as well as the village organisations supported by it. The job involves a fair degree of drive, creative thinking and sound interpersonal skills A management graduate with about 3 -5 years experience with a corporate body or a voluntary organisation will ideally fit the bill.

ADMINISTRATION AND PERSONNEL MANAGER

The position entails the development of personnel policy guidelines, performance and potential appraisal formats in coordination with the HRD/ Training Manager. Additionally, he/she will also be required to develop appropriate systems for decentralised Programme Managers. AKRSP (I) expects the candidate to have 10 years experience in a similar position. The position calls for extensive travel.

RESEARCH AND MONITORING COORDINATOR

The responsibilities entail development of a systematic reporting, research and monitoring system of a complex Natural Resource Management Programme. The incumbent will be expected to design and execute research projects as well as develop and refine indicators for a monitoring system. He/she should also be instrumental in enabling AKRSP (I) develop an inhouse facility in this highly specialised area

The candidate should have about 3 - 5 years research experience Familiarity with the use of computerised statistical packages would be an added advantage. He/she will be expected to travel extensively.

PROGRAMME COORDINATOR

Based at the District Team Office, he/she will lead a team of development professionals in a district towards supporting integrated natural resource management by village communities. He/She should have strong leadership qualities,be able to achieve targets and work under pressure. The ideal candidate would be a management graduate or a master of social work with 3 years relevant experience. A natural affinity for working in a rural environment will be a prerequisite for the post.

All the above positions, except that of the Programme Coordinator are based at Ahmedabad, and offer a challenging working environment and the opportunity to travel extensively. Apply in strict confidence along with present salary details within 15 days to

Economic Planning in 1990s and Beyond

A major task of the Planning Commission in the 1990s and beyond insofar as the public sector is concerned, should be how to avoid duplication of the work which legitimately belongs to the different ministries and recognise the autonomy of the state governments For the private sector, the plan targets have always been only indicative, but the important question now is how indicative planning in a more deregulated environment with hardly any instruments to enforce the indicated targets will fit into overall economic planning **1457**

Assessing Gorbachev

In any assessment of Mikhail Gorbachev, to look for precise categories is to altogether miss the point of the paradox of the man He felt pushed towards the reforms he felt were absolutely essential but he was also held back by the tradition from which he had come and to which, in a profound sense, he still belonged What proved to his undoing was the manner in which he related to Soviet reality He did not understand that he was making ideological appeals to a society that had been in essence completely de-ideologised over the decades **1465**

Sugar Muddle

The government administration at the highest levels has acted in a totally confused manner in dealing with the relatively routine problem of periodic decline in the production of sugar **1438**

Hindutva Agenda

Hindutva as an ideology is the dominant castes response to the emergence of the Indian version of class struggle to the growth of class like formations that have threatened the traditional elite time and again in modern history **1450**

Having been defeated by the SP BSP combination in UP the BJP now sees the need to garner the support of in addition to upper caste Hindus the backward castes and is engaged in a search for political symbols which will enable it to achieve this **1447**

Freedom

The newly emerging business class in Czechoslovakia is trying hard to push back the trade unions claiming total freedom for the owners of enterprises **1449**

Press as Mirror

What does a content analysis of Pakistani newspapers tell us about the dominant concerns of the country's intelligentsia? **1482**

The Bailiff

The position of West Bengal s Left Front government is not unlike that of the bailiff of a bankrupt landlord—lacking control over decision making and yet saddled with the responsibility of managing crises arising from systemic defaults **1440**

Beyond the Pale

The shameful case of Kannappa in Kolar district of Karnataka and the responses it has evoked bring out the hypocrisy of the government machinery and the leadership of all political parties with regard to the social location and rights of dalits **1443**

Business as Usual

Though the problems of determination of central government employees pay are now very different from those 10 years ago in drafting the new Pay Commission s terms of reference the last Commission s terms have been mindlessly copied **1441**

Global Concerns

Multinational enterprises have their own strategies for the highly competitive global market place and are impervious to their consequences for the particular economies they happen to operate in **1437**

LETTERS TO EDITOR

HRD Expenditure

IN the article 'Fiscal Correction and Human Resource Development' (March 26), the authors' conclusion about central government expenditure is not in line with the data. Combination of the realised expenditure of the first two fiscal years of the present government (1991-92 and 1992-93) and the planned expenditure of the last fiscal year (1993-94) shows a 15 per cent real increase of plan and non-plan HRD expenditure (6 per cent compared to 1989-90). This should be put against the background of a real (plan and non-plan) decrease in expenditure of more than 18 per cent, compared to 1990-91. The HRD expenditure increase has resulted in a sharp increase (although from a low level) in the share of HRD expenditure in total expenditure of 41 per cent (29 per cent compared to 1989-90).

The authors' conclusion that "in the case of the central government the reduction in HRD expenditure is mainly on account of stabilisation policies to reduce deficit" is therefore completely wrong. Although the share of HRD expenditure in total (central and state) government expenditure is still rather low (about 20 per cent), with regard to central government expenditure we can only conclude that social expenditure has not been a victim of fiscal correction, and that even the share of HRD expenditure in total expenditure has risen sharply (although from a low level). The moderate decline in the (rather regressive) food subsidies has been more than compensated by the real increase in other social sectors. Although targeting would have been preferable, we cannot conclude that, as a result of structural adjustment, priority for HRD expenditure is less than before structural adjustment. The recently announced budget (1994-95) does not indicate a different trend.

As far as state expenditure (not including the 1993-94 budget) is concerned, the authors' conclusion that HRD is neglected in adjustment is correct. On the one hand, real social expenditure has been (slightly) reduced since the beginning of structural adjustment, on the other the share of revenue social expenditure in total expenditure in the states has fallen by 7 per cent between 1990-91 and 1992-93. The latter cannot be blamed on declining centre-to-states grants, but is a matter of priority setting.

Comparison of per capita social expenditure of states with per capita grants from the centre shows that the so-called progressively ruled states give very little priority to social expenditure, not only per capita (especially Bihar and UP), but as a percentage of grants from the centre as well (especially Orissa). The priority given to the social sectors by even West Bengal is not what could be expected from a 'progressive' government.

The Hague

Doctored Knowledge

AMRIT SRINIVASAN'S article (December 11, 1993) is so refreshing! It shows the depth of scholarship, so rare among social scientists of our country. She has got together a wide range of information to substantiate her arguments and is clear in her presentation. One outcome of this scholarly work is to call the bluff regarding the Emperor's invisible robes. The Emperors have been paraded naked, showing their deformed ugliness. They have distorted the methodology of social anthropology/sociology/indology to subserve the interests of the colonial rulers. Such 'doctored' knowledge has been avidly 'internalised' by their students from colonial India, thus forming the foundations of the social science studies here. Patrick Geddes, A C Haddon, W H R Rivers, A H Keave, A R Radcliffe-Brown, E E Evans-Prichard and B Malinowski have rightly been mentioned as the 'White Gurus' of the native Indian students who later pioneered academic social science studies. G S Ghurye started in Bombay, L K Ananthakrishna and S C Roy in Calcutta, D N Majumdar in Lucknow and A Ayappan in Madras.

Srinivasan has rightly pointed out that: "When fieldwork was colonial, it was understandable that we, as servants of the raj, acted as modest assistants to the British, sometime even taking their scholarly place, but only in the data collecting, 'art' half of the positive praxis, leaving science to our betters. But today, when fieldwork is post colonial, it is surprising that things are not so different. In fact, if anything this surrogate science has been preached with the zealousness of the new convert only after India gained freedom from British rule." This is a very apt diagnosis of the malady that affects academic activities in social sciences in India. Its significance is much greater, because it offers an explanation that is relevant almost to the entire academic field in India. Knowledge has been systematically distorted to subserve specific vested interests. This unethical approach to knowledge generation has given rise to the formation of 'syndicates' and even 'mafias' in the academia. "If you follow the 'party-line' laid down by the syndicate, you would be properly rewarded. However, if you dare to challenge the Emperor about the robes, the Empire will strike back and totally annihilate you." It is reassuring to those who have been at the receiving end of the academic mafia that there are still scholars of high calibre who refuse to toe the party-line and get ready to pay the price for their 'crimes'.

D BANERJI

New Delhi

Bottom of Class

THE Planning Commission is apparently much exercised about the slow growth of the Indian economy. n its mid-term review of the Eighth Plan, the commission said to be proposing to revise the plan's average growth arget from 5.6 per cent per annum to 4 per cent The Eighth Plan (1992-93 to 1996-97) was finalised in July 992, a full year after the structural adjustment programme egan to be implemented; yet the Planning Commission ind its growth, investment and employment generation goals have apparently been overtaken by the economic eforms.

Apart from the average growth rate in the first three 'ears of the plan being unlikely to be more than 4 per ent per annum, serious sectoral imbalances have emerged in the growth process. The sharpest shortfall is likely be in industry, with the pattern of industrial growth lso diverging significantly from that anticipated in the lan. The plan had anticipated an average growth of 8.2 er cent per annum in the value of gross output of mining nd quarrying, manufacturing and electricity generation, ut in the first three years of the plan the rise in the index f industrial production is unlikely to be more than 3.5 er cent per annum. It is because of the sluggish growth in ianufacturing for four continuous years from 1991-92 iat the pressure on infrastructure sectors such as power as not been felt. Again, within the manufacturing sector, growth of the capital goods industries has been severely fected by reduced demand following the cut in ivestment—and not so much because "the performance f the indigenously manufactured capital goods is nowhere ear the contemporary levels in terms of process chnologies, quality of products, productivity and ost of production", to quote the Eighth Plan's aprehensions. There has been a significant rise in the output f consumer durables, whereas the output of consumer on-durables has suffered a setback. While the Eighth lan emphasises the importance of improving the lucational and health status of the people, for which the lan had earmarked larger resources, actual performance the first three years leaves much to be desired in this spect. However, it is in regard to the crucial goal of generating employment growth of 2.6 to 2 8 per cent, or about 8 to 9 million jobs per annum, that the failure has been most glaring.

When such is the actual performance of the economy, the Planning Commission officials' reported optimism that the private sector will make up for the shortfalls in public sector investment and employment generation is plain dissimulation. The pattern of investment, output and employment generated by the private sector cannot be expected to improve the emerging scenario of rising unemployment and poor social sector development. In its mid-term review of the Eighth Plan, the Planning Commission needs to address the question to what extent the resources appropriated by the private sector oriented pattern of development is crowding out resources, for instance, for rural development and strengthening the social sectors.

It is interesting that even as the Planning Commission is exercised over scaling down the growth target from 5.6 per cent to 4 per cent, the UNDP's *Human Development Report, 1994* should rank India 135th among 173 countries. Differences of opinion on the advisability of constructing a composite 'human development index' to represent levels of socio-economic development notwithstanding, there can be no gainsaying that a country such as India, at its present stage of development, needs to worry about the social aspects of development or, to put it differently, in respect of GDP growth it is the composition of such growth rather than just its size which is really material. The HDI constructed by the UNDP is an unweighted average of life expectancy, literacy and some modified measure of income per capita and gives India a low rank. Actually if some other social indicators are considered as well, India's rank is likely to slip lower still. The issue is not new; but the Planning Commission evidently remains impervious. Its focus continues to be on fractional adjustments of the—not very meaningful—overall GDP growth target. Why the country should rank so low in inter-country comparisons of human development do not concern the commission—even less now, under the regime of economic reform and liberalisation.

PUNJAB

Rebuff to Clergy

THE recent by elections in Punjab were significant on several counts Although these were only by-elections they were the first democratic assembly level elections to be held in the state in many years In the last elections in 1992, only 10 per cent of the electorate had participated the non participation of the rest being apparently due to the Akali boycott of the elections, although it may well have been due to the fact that the militants had supported the boycott

The overwhelming victory of the Congress(I) in the last elections was largely due to this boycott In other words until the present by elections the Congress(I) had not really faced the electorate and tested its popularity for a long time Now that this has happened even though at the micro level the party cannot be said to be very happily placed It has lost the Ajnala seat to Akali Dal (Badal) by 10 314 votes a margin that is large enough to force the party to sit up and think of its prospects in the next assembly elections And whereas it has won in Nakodar the other constituency that went to the polls it could do so only with a slender margin of 5,210 votes Significantly in this constituency which has been a traditional Congress(I) stronghold the party has secured 13 000 more votes than the same Akali Dal (Badal) candidate (Kuldip Singh Wadala) did during last year's Lok Sabha poll Thus the party which has really gained both at Ajnala and Nakodar is the Akali Dal (Badal)

This gain that has accrued to Akali Dal(Badal) is an indication of the possible alignment of political forces in the overall politics of Punjab in the coming period It suggests that in an atmosphere where the militants are no longer in a position to dictate terms to the Akalis the latter are likely to come into their own and pose a challenge to the ruling Congress(I) It also signifies that the Beant Singh government which claims to have put an end to militancy in the state cannot any more arrogate to itself the right to rule the state only on that basis It will now have to pay more attention to the routine tasks expected of a government if it wants to continue in power after the next elections

The victory of Akali Dal (Badal) at Ajnala and, in a different sense, at Nakodar is not any the less significant for Sikh politics in general and Akali politics in particular For the former, it points to a trend among the Sikh masses that has the potential to undermine in the longer run the authority of the Sikh clergy *vis a vis* the Akalis While traditionally Akali politics has never been completely free of the influence of the clergy, the latter had consolidated this influence even further during the recent era of militancy It is true that for a while during this period the clergy was merely playing into the hands of the militants not all of whom had the customary respect for its religious status Overall however it had managed to emerge stronger and found itself in a position to exert itself in the post-militancy era The so called Amritsar declaration made less than a couple of months ago, was the most significant recent attempt on its part to exert its authority While most Akali factions succumbed to this pressure and once again demanded a separate Sikh state Akali Dal (Badal) refused to toe the line and join the unified Akali Dal (Amritsar) By supporting the Akali Dal (Badal) and defeating a rebel Akali candidate who was covertly backed by the unified Akali Dal and could manage only 1 075 votes, the Sikh populace has administered a rebuff to the clergy

The rebuff also extends to other Akali factions now unified under Akali Dal (Amritsar) The meaning of the rebuff in this context is that the Sikh masses prefer moderate politics as against the militant one advocated by the new Dal While these events are only straws in the wind so far as the future of secular and really democratic politics in the state is concerned they indicate a potential within Sikh and Akali politics to bring on line the hitherto derailed politics of Punjab

SUGAR STORY

Working for a Windfall

THE government's lack of sincerity in containing inflation has been exposed by the sugar muddle The events leading up to the fiasco are worth noting First, faced with sharp increases in prices of essential consumption items the government constituted, at the initiative of the civil supplies ministry a 10-member inter-ministerial co ordination committee to monitor prices and availability of 12 essential commodities (sugar included) this January Second, as part of this exercise and the deliberations of the Cabinet Committee on Prices (CCP) headed by the finance minister the food ministry prepared a note predicting severe shortages of sugar and possible sharp increase in its prices in the 1993-94 (October September) season With substantial diversion of cane to gur and khandsari, particularly after the decontrol of molasses, the earlier estimate of production of 107 lakh tonnes in 1993 94 was scaled down to 104 lakh tonnes This compares with the production of 106 lakh tonnes in 1992 93 and 134 lakh tonnes in 1991-92 Further, the carry-over stock at the beginning of the 1993-94 season (October 1, 1993) was only about 9 13 lakh tonnes against 49 02 lakh tonnes two years ago and 31 13 lakh tonnes a year ago The food ministry had modestly placed the gap in supplies in 1993-94 at 11 13 lakh tonnes which was to be filled by imports Third, following this assessment, the cabinet placed sugar imports under open general licence (OGL) on March 15 Immediately there emerged an import cartel of sugar producers under the label of Indian Sugar General Industry Export Import Corporation (ISGIEIC) to regulate imports The effectiveness of the cartel can be judged by the fact that a food ministry official lamented as late as in May that only a paltry 1 70 lakh tonnes of sugar had been contracted for import and that too as required by bulk consumers such as hoteliers and sweetmeat manufacturers

In the meantime the government decided that the State Trading Corporation (STC) should import sugar The STC was expected to undertake imports as per an 'action taken report' of the food ministry, prepared in February this year, on the 45th report of the Public Accounts Committee (PAC) which had passed severe strictures in 1989 on an earlier sugar import scandal This follow up action taken five years after the PAC report emphasised that STC alone should import sugar also, STC was expected to address its import enquiries only to a list of registered sugar dealers in the international market Fourth much before the OGL decision however a few Indian private parties got wind of the government s impending decision to enter the sugar market for import and anticipating a rise in prices once India entered the market quietly resorted to futures trading at the then prevailing low prices of $ 270 to $ 280 per tonne in the international markets

Fifth despite the decision to import sugar the STC (and the MMTC) dithered, ostensibly because the question of payment of subsidy on the sale of imported sugar through the public distribution system (PDS) had not been settled Nothing was done till the third week of May In the meantime, the London quotation for sugar rose to $ 333 per tonne on May 6 because it was known that India was to import sugar Sixth, on May 14 just a few minutes before emplaning for his US visit on the tarmac as it were, the prime minister is reported to have instructed cabinet secretary Zafar Saiffullah to take immediate steps to augment sugar supplies Saiffullah consulted the expenditure secretary and asked the food secretary to order the Food Corporation (FCI) to float tenders for sugar imports This amounted to reversing two major decisions of the food minister, namely, that the FCI would not be involved in sugar imports and that only registered sugar dealers in the international markets would be approached for tendering The FCI apparently floated tenders with other parties as well at relatively low prices of $ 250 to $ 280 per tonne The seventh act of the drama consisted of food minister Kalpnath Rai cancelling the tenders floated by the FCI on the ground that FCI's import of sugar had been adversely commented on by the PAC in 1989 He was supported by commerce minister Pranab Mukherjee

Meanwhile, the price of sugar in the country shot up from about Rs 12 50 per kg to Rs 15 50 per kg on the eve of the by elections to the Lok Sabha and the state assemblies This was only to be expected as the government had

drastically curtailed the release of free sale sugar—to 5 40 lakh tonnes and 4 75 lakh tonnes in April and May (compared to 6 50 lakh tonnes each in April and May 1993) The release in June was 4 90 lakh tonnes against 6 75 lakh tonnes in June 1993 The prime minister now entered the picture for the eighth act and directed that the STC and MMTC import 8 5 lakh tonnes of sugar Reportedly, the day India entered the market the international price of sugar shot up by $ 8-10 per tonne, from $ 343 per tonne to $ 353 per tonne A part of STC's buying is said to have been done at the astronomical price of $ 438 per tonne—from an international trading house, EDF Mann, said to be a company with Indian interests, which had done the initial futures trading The prime minister brought the drama to a close with the ninth and final act by committing the government to footing the subsidy bill on the imported sugar which is estimated to amount to Rs 450 to Rs 500 crore

What has been the outcome of the whole sordid affair? On a rough estimate, on import of 8 50 lakh tonnes of sugar as ordered by the prime minister, the country has lost about $ 100 million in foreign exchange (Rs 314 crore) which has gone into the coffers of the international traders, many of whom are apparently Indians Second, the budget will have to bear an additional subsidy of Rs 450 crore to Rs 500 crore which could have been kept down to Rs 150 crore to Rs 200 crore had the government effected prompt imports Third, the rise of Rs 2 50 to Rs 3 per kg in the open market price of sugar will fetch the industry an additional Rs 800 crore to Rs 1,000 crore in the current sugar season at the cost of the consumer, which a grateful industry will no doubt be prepared to share with those who have been responsible for the windfall

TELECOM POLICY

Limited Vision

THE debate that has followed the introduction of the telecom policy is further indication of the growing disarray at the policy-making levels of government It shows the inability of the state to grasp the significance of the changes that its policies in one sphere bring about in another and its increasing detachment from real issues And because policies are being made to cater not to the overall needs of national development but to immediate and limited purposes, they will either become dysfunctional once these purposes are served or will be so open as to be interpreted any which way by those who have the power to do so

The objective of the new telecom policy introduced last month is purportedly telecommunications for all, which is translated as the availability of telephones on demand, of telecom services at affordable and reasonable prices covering all parts of the country, achieving world standards in the quality of telecom services and ensuring that India emerges as a major manufacturing base and exporter for telecom equipment The development of telecommunications is being given the highest priority because it is a 'vital infrastructure which is technology-intensive Therefore the inflow of technology should be made easy Hence the opening up of the sector to private and foreign investment

The question as to what are affordable telecommunication services in the context of a population with decreasing access to food and health care leave alone education and employment is of course not addressed The government evidently believes the publicity it has generated about modernisation that with telecommunications, health care may be delivered via satellites and radio services, and education through E mail services and all sorts of help at the end of a telephone Telecommunication networks can increase access to services only if the services are already in place and are affordable In the absence of other development, telecom helps commerce and only itself, encouraging an expansion of the service sector

With the new policy the government will make room for private investors to supplement government inputs and allow private and foreign participation in the expansion of the telecom network with tariff and revenue sharing arrangements Until now, only so called value added services had been opened to private investment However, the guidelines for clearing projects are still being formulated In the meanwhile developers will be allowed to undertake pilot projects ostensibly in order to test out new equipment and services There are already several such projects on the anvil which will presumably be cleared on an *ad hoc* basis without recourse to guidelines or any mandatory approval or regulatory structure It would not at all be surprising if the guidelines take a long time in their formulation

Among the norms being set by the ICICI for the department is a mandatory rural urban ratio for private parties and revenue-sharing and tariff regulations But interestingly even before the guidelines have been announced, the critics have hit out at what have been reported to be the requirements For instance, they point out that the profit per line works out to only $ 300 in India whereas it is $ 750 in developed countries This being so, it would hardly be likely that a low profit rural sector will attract investors who will also be hesitant about accepting the requirements On the other hand, many developed country policies have retained basic services in the state sector a fact that appears to have been totally missed by advocates of private sector participation in the economy

The policy is emphatic about the lack of resources blocking the development of services to the rural sector And yet, the Sixth Report of the Standing Committee on Communications of the Tenth Lok Sabha points out that it is unrealistic planning and not paucity of funds which has affected the growth of the network It has also pointed to the lack of proper co-ordination with the state and civic authorities of hold ups due to inability to procure equipment on time and lack of supervision and monitoring of ongoing projects This would seem to indicate a deliberate neglect which is now being projected as due to paucity of funds While there is no doubt a resource crunch, the inefficiency of the telecom network and the delays have their roots elsewhere But nobody wants to know

BODOLAND VIOLENCE

Victims All

THE recent massacres near Kokrajhar in the Bodoland Autonomous Council (BAC) area of Assam in which officially 22 people including women and children were killed and many more injured is not the first of its kind in the area Indeed since the signing of the Bodo Accord and the formation of the BAC last year, tensions which had always been dormant in the area have come into the open In the most serious incident of this kind since then in September October last year, scores of people were killed and thousands had to flee their villages and the camps in which those refugees continue to stay have also come under attack

These incidents are hardly surprising given the inherent tensions in the situation where a large number of migrants have been settled in areas historically inhabited by the Bodo people (the more extreme nationalists among whom claim that the whole region is their historical homeland where everyone else is an encroacher) and which were officially recognised to be so when small segments were designated as tribal belts and blocks The systematic encroachment into these areas of people not merely not belonging to the tribal stock but also gifted with the talents and resources for more advanced methods of agricultural production has been the fundamental factor that has contributed to these tensions The tensions long dormant are now breaking forth in violent forms to the extent that the tribal people themselves have become more conscious of their rights and more apprehensive of the loss of control over their lands given the heightened expectations and all around exacerbation of the economic crisis

And yet none of these factors appear to have been taken into account in the trading of charges that has followed the latest carnage According to chief minister Hiteswar Saikia the killings are the handiwork of forces within the Bodo leadership which are opposed to the Bodo Accord— as he interprets it—and his efforts to implement the accord According to Sansuma Khunggur Bwiswmutiary, the former president of the All Bodo Students' Union (ABSU) and later the chief executive member (CEM) of the BAC, and currently locked in bitter rivalry

with his erstwhile colleague and the present CEM, Premsing Brahma (both Bwiswmutiary and Brahma claim to head the real Bodoland Peoples' Party, BPP, the split in which has been yet another 'achievement' of Hiteswar Saikia), the killings are the handiwork of those "working at the behest of the chief minister", meaning his rivals within the ranks of the Bodo leadership. Neither of these leaders, nor indeed any organised political party or group in the state, wants to acknowledge that behind the so-called 'ethnic violence' lies a history of short-sighted and narrow political, indeed electoral, calculations and plain greed. This is as much true of the current clashes between sections of the Naga and Kuki people in Manipur, Nagaland and parts of Assam as of the massacres in the BAC area.

That the victims in the current violence in the BAC area comprise overwhelmingly, perhaps even solely, the Muslim settlers of erstwhile East Bengal origin, invests the ongoing massacres with another complicating dimension. For, both the perpetrators and victims of the violence are equally the victims of a process over which neither had any control. The settling of the peasants of East Bengal origin in an area where they should never have been settled in the first place was done by colonial administrators as part of a broader economic policy of increasing agricultural production and augmentation of revenue. However, the local gentry, tribal and non-tribal, were merely unequal partners in that enterprise, however bitterly opposed they may be now to what is an accomplished fact, and however genuine the current apprehensions over what the future holds in terms of loss of land and livestock and also the necessity to share political power with the settlers.

Unlike the earlier incidents of violence which were confined to the northern parts of Kokrajhar district which had pockets of non-Bodo concentration, last week's incidents took place in areas in the vicinity of Kokrajhar town itself. Clearly, the components of agrarian tension in the tribal inhabited areas of Assam, present for long in an incendiary mix and exacerbated over the years, are now running unconfined.

The buck-passing between Hiteswar Saikia and Bwiswmutiary once again highlights the haste and arbitrariness with which the Bodo Accord was signed, without a proper consideration of the complex issues involved. Over a year after the accord was signed, the area and the boundary of the BAC continue to be contentious issues and have indeed led to the split in the Bodo leadership. The crucial question of land was not even touched upon in the accord; nor the question of what would happen to the non-Bodo minorities, the most vulnerable of whom, the Muslim peasantry of erstwhile East Bengal stock, have been at the receiving end.

To recognise the culpability of forces internal to the society in the current violence would entail a measure of self-introspection which is beyond the capacity of Hiteswar Saikia and the Bodo leadership both of whom, even while trading charges, have been equal partners in the present tragedy. It is not accidental that while Bwiswmutiary has been harshly critical of the recent success of Hiteswar Saikia in securing a closer 'political' collaboration between the incumbent BAC leadership and the Congress Party in Assam, he was the one who took the initiative towards such collaboration when he was at the helm of the Bodoland agitation and later when he headed the BAC. His quarrel has always been with Hiteswar Saikia and not with the Congress Party; and even with Hiteswar Saikia only to the extent that he felt threatened at the latter's successful attempts at appropriating the Bodo leadership.

Given these crass calculations and the undeniable material interests and apprehensions, especially concerning land, more violence of a possibly more generalised kind, with much less clear demarcation between victims and perpetrators, in the BAC area cannot be ruled out.

KANORIA WORKERS

In Limbo Still

WORKERS' participation in management is a principle which is loudly acclaimed by both the trade union leaders and the government. Yet, when it comes to brass tacks, both the established trade unions and the administration appear to shy away from its implementation.

The latest development around the six-month old stalemate in Kanoria Jute Mill in Howrah in West Bengal is an instance of bureaucratic apathy and political rivalry. Following closure of the mill by the management on November 26 last, the workers took over the factory and started production. But the court, by a ruling, prevented them from selling the goods. Meanwhile, the workers organised under Sangrami Sramik Union (SSU) (unaffiliated to any political party) collected funds, set up community kitchens and paid token salaries to the workers. The CPI(M) trade union organisation, the CITU, immediately started a slander campaign against the workers of Kanoria, accusing them of taking money from industrialists, a lie which was soon nailed by the workers.

Following pressures built by mass support to the Kanoria workers, chief minister Jyoti Basu finally agreed to sit with the Sangrami Sramik Union leaders on February 28, when he assured them of his co-operation in finding an early solution to their problems, including facilitating the sale of the finished goods lying in the factory. Soon after this meeting, the SSU submitted a scheme for running the mill on a co-operative basis to the Board for Industrial and Financial Reconstruction (BIFR). It also accepted the BIFR proposal to run the mill as a joint venture, where the workers' co-operative would hold a 40 per cent ownership, and a private promoter the rest. A private promoter was also located. The BIFR has now appointed the Industrial Finance Corporation of India (IFCI) as the operating agency to negotiate.

Given the slow pace of administrative functioning, the process of reopening the mill is likely to take a long time. The SSU has therefore suggested that the West Bengal government take over the mill on a temporary basis and hand it over to the workers' co-operative so that production can be resumed immediately. But the state government continues to dilly-dally, while the fate of 4,000 workers hangs in the balance. Basu's assurance on February 28 is yet to be followed up.

The ruling Left Front itself seems to be divided on the Kanoria developments. The CITU leadership has been consistently slandering the SSU, since its own union in Kanoria Jute Mill was rejected by the workers after it had failed to take up their cause. The CPI and other Left partners of the Front have unofficially extended their support and sympathy to the Kanoria workers. But, unless the CPI(M), which is the head of the ruling Left Front, shows its political will to expedite the process of settlement through a temporary take-over of the mill by the state government, as suggested by the SSU, no other partner of the Front can make things move. There is strong opposition to any move that might vindicate the six-month long struggle of the Kanoria workers from a section of the CITU leadership, which is still smarting under the sense of humiliation suffered in Kanoria where the workers rejected its union.

In fact, the Kanoria developments as also those in a few other crisis-ridden establishments in West Bengal (where too the workers have spurned their traditional trade union leaders, both from the CPI(M) and Congress, who had failed to make the employers pay the workers their dues, reopen the factories or re-employ the retrenched workers, and threw up their own independent unions which were prepared to adopt militant tactics like taking over of factories and resuming production, as in Kanoria), sent a shiver down the spines of the squeamish, Marxist-turned-Establishment trade unionists who were threatened with the dangerous prospect of displacement from their traditional labour enclaves. Instead of welcoming the Kanoria workers for taking a lead in solving the nagging problem of 'sick' industries and helping them to run their mill, resume production and sell their goods, the West Bengal Left Front government, pressurised by the vested interests of the CITU and the vindictiveness of some of its leaders, chooses to dawdle, on the convenient plea of adhering to legal and administrative procedures. For the CPI(M) in West Bengal, sticking to bourgeois rules and regulations is now more important than protecting the interests of starving workers.

Kotak Mahindra Finance

ONE of the first Indian finance companies to have an independent set-up abroad, Kotak Mahindra Finance (KMF) has established a 100 per cent subsidiary christened Kotak Mahindra International in Mauritius. It is also setting up its first office in Dubai and plans to set up offices in other international finance centres. A leader in the financial services sector, the company has, for the second year in a row, achieved the highest net profit (Rs 42 crore) and market capitalisation (Rs 860 crore) among non-banking finance companies (NBFCs). For the year 1993-94 the company saw a 66 per cent rise in net profit over the previous year on a 51 per cent higher total income. Further, the net profit figure for the last six months of 1993-94 was higher than the profit earned for the entire previous year. The company is a leader in bill discounting and its car finance division, itself a leader among NBFCs, disbursed Rs 100 crore in 1993-94. Its investment banking group, which has a significant presence both in the local and international markets, has handled issues for such stalwarts as Dabur and Godrej Soaps in addition to handling euro-issues for Arvind Mills, Tube Investments of India, Garden Silk Mills and Tata Electric Company. KMF now plans to float a mutual fund for which it has received the necessary permissions. Recently it also entered into a memorandum of understanding with Goldman Sachs, one of the largest investment banks in the world, for investment banking activities.

ICNET

Following the signing of a licence agreement with the Department of Telecommunications (DOT) in January 1994, ICNET has achieved sales of Rs 2.9 crore in just three months. The company's total income for the 12 months ended March 1994 amounted to Rs 3.5 crore while net profit touched Rs 1.3 crore giving a net profit margin of 37 per cent. In addition to its existing eight centres, the company set up another nine centres extending its connectivity to other important cities and registered 1,900 subscribers during this period. Further, it commenced operations from USA and Canada and entered into a partnership with a prominent group in Muscat and expected to generate a revenue of Rs 2.2 crore in foreign exchange in 1994-95. The company now proposes to expand its operations to another 53 cities in addition to opening international connectivity to Great Britain, France, Germany, Switzerland, Sweden, Hong Kong, Singapore, Malaysia, Australia and Japan. In the current year ICNET expects to notch a total income of Rs 12.7 crore from Indian subscribers. Rs 1.5 crore as net contribution from its American operations and Rs 2.2 crore as net contribution from its Gulf operations yielding a net profit after tax of Rs 5.7 crore. Apart from internal generation of funds the company also plans to tap external sources for its future plans.

Haria Exports

Haria Exports which is engaged in the manufacture and export of garments (comprising men's shirts, ladies skirts and shorts) at its two units in Vapi and Kandla, both in Gujarat, was ranked 18th among garment exporters by the Apparel Export Promotion Council for 1992. It is a government recognised export house and the second largest manufacturer of garments in the country under its own umbrella. The company, which has a good marketing network and overseas offices at Hong Kong, Nairobi, Dubai and New York, belongs to the Haria group. The company now plans to expand its garment manufacturing capacity from the existing 9.84 lakh pieces per annum to 14.12 lakh pieces per annum. It also proposes to upgrade its washing facilities in Kandla and set up a showroom-cum-marketing office building in Bombay. For the year 1993-94 the company earned a net profit of Rs 2.5 crore on a net sale of Rs 32.4 crore. To part finance its project the company plans to enter the capital market in August.

Standard Surfactants

One of the leading detergents and chemical manufacturers in the country, Standard Surfactants has completed its expansion programme leading to an increase in the capacity of its two units at Bhopal to 30,000 mtpa each. As part of its expansion plans the company is setting up another unit at Mandideep in Bhopal to manufacture film sulphonation which is a surfactantive agent used mainly in the soap and detergent industry. The plant, estimated to cost Rs 14.3 crore, is expected to commence commercial production in the current financial year and will add to the company's capacity by 12,250 mtpa of LABS or 19,900 mtpa of AOS or a combination thereof. To part finance the new project the company recently entered the capital market with a public issue which was oversubscribed.

Firstohm India

A joint venture between Frist Resistor and Condenser Co (Firstohm) of Taiwan and Rakesh Khanna, Firstohm India (FI) is setting up a 100 per cent export-oriented unit for manufacturing resistors. The EOU which is estimated to cost Rs 7.4 crore will have an installed capacity of 1,650 million resistors per annum and will operate as an offshore manufacturing facility for the Taiwanese company. Firstohm will provide full technical support including training of engineers and will be contributing up to 38 per cent of FI's post-issue equity in addition to supplying the necessary raw material at internationally competitive prices and buying back 100 per cent of the company's production. The international scale plant is being set up at SEEPZ in Bombay and will have four production lines for 1/4 watt carbon film resistors, one line for 1/2 watt carbon film resistors and two lines for 1/4 watt metal film resistors. The first phase of the project has already commenced commercial production and the second phase is expected to go on stream in July this year when the company plans to enter the capital market with its public issue to part finance its project.

World Digital Sound

World Digital Sound (WDS) is setting up the country's first export-oriented unit for manufacturing compact discs at Noida with an installed capacity of 6.6 million discs per annum. For this purpose it has entered into a technical and financial collaboration agreement with Toolex Alpha of Sweden which is part of the renowned Grimaldi Industries AB of Sweden and has an installed capacity of more than 100 compact disc manufacturing plants all over the world. The Swedish company will have a 15 per cent stake in the post-issue equity of the company and will buy-back up to 50 per cent of WDS's production. The project, which is estimated to cost Rs 15.5 crore, is in an advanced stage of completion and is likely to commence production next month. To part finance the project the company plans to tap the capital market shortly with a public issue of 47.9 lakh equity shares of Rs 10 each at par.

Flex Chemicals

Part of the Flex group of companies, Flex Chemicals (FC) has been promoted by Ashok Chaturvedi. After establishing itself over the years in pouch-making activities, the company is now diversifying by setting up a project for the manufacture of printing inks and adhesives. The Rs 18.8 crore project is being set up at Ghaziabad in Uttar Pradesh and will have an installed capacity of 1,620 mtpa FC has entered into technical collaboration agreements with Color Converting Industries of USA for manufacturing inks and with Sunkyong Industries of Korea for the manufacture of adhesives. To part finance its project the company is entering the capital market with a public issue of 17,00,000 equity shares of Rs 10 each at a premium of Rs 50 per share on June 13.

CURRENT STATISTICS

EPW Research Foundation

The current fiscal year has begun to experience some moderation in reserve money growth because of a sharp reduction in net RBI credit to the central government but the banks' deposit and non food advance growth has accelerated There has been a revival of activity in the share markets Exports in dollar terms showed a 12.6 per cent rise in April against 28.9 per cent in April last year while imports grew by 13.5 per cent against a decline of 3.6 per cent last year While agriculture-based commodities and traditional goods continue to dominate exports increase in the share of capital goods in imports is likewise conspicuous

SYNTHETICS AND CHEMICALS

Threat from Imports

SYNTHETICS AND CHEMICALS which is engaged in the manufacture of synthetic rubber (SBR) and lattices of the butadiene-styrene type (also known as CR-S rubbers and lattices), styrene and butadiene saw a fall in its profitability in 1992-93. The continued recession in the automobile industry affected offtake and the company's net sales fell by 2 per cent over the previous year. The government's liberal import policy of allowing duty-free import of SBR against advance licences to exporters of tyres added to the company's woes. Production was also lower at 33,371 mt (36,098 mt) of rubber and 522 mt (560 mt) of styrenated phenol while sale in volume terms fell from 35,320 mt of rubber and 64 mt of styrenated phenol in 1991-92 to 31,606 mt and 60 mt, respectively. Increase in raw material cost and other operating expenses led to a 9 per cent fall in operating profit. Interest charges rose by 3.3 per cent while depreciation provision was higher by 18.4 per cent. However, the company managed to show a higher net profit mainly due to a higher non-operating profit and a zero tax provision in 1992-93.

The company's alcohol distillery was commissioned in December 1993 and the unit's production was reportedly well received in the market. Further, the company is also exploring the possibility of exports. Its expansion project which envisaged increasing its SBR capacity from the present 41,000 mtpa to 70,000 mtpa was expected to commence commercial production in the first half of 1994. To part finance the project the company entered the capital market in late 1993 with a rights issue of equity shares in the ratio of five equity shares for every four held at a premium of Rs 25 per share. With this the company's equity capital has increased from Rs 11.2 crore to Rs 25.2 crore.

The customs duty reliefs received by the company in the 1993-94 budget has been passed on to the consumers. Meanwhile, representations made by the company to the authorities against the liberal import policy led to a government notification under which only 9 kgs of SBR can be imported duty-free against the export of 100 kgs of tyres. However, as the notification came only in June 1993 and as some time is expected to elapse before the SBR already imported is absorbed, the company's performance in the first half of 1993-94 was adversely affected. Thus, while net sales fell by 50 per cent to Rs 40.8 crore, the company suffered a net loss of Rs 3.7 crore as against a net profit of Rs 5 crore in the corresponding period last year.

KANORIA CHEMICALS

Modernisation Yields Results

Incorporated in 1960, Kanoria Chemicals is engaged in the manufacture of caustic soda, chlorine, chlorine products and other chemicals, jute goods, cloth and yarn. Its two chemical divisions are situated at Renukoot in Uttar Pradesh and Ankleshwar in Gujarat while its synthetics division which was taken over from the erstwhile Anil Synthetics is situated in Ahmedabad. For 1992-93 the company's improved performance has brought it back into the black with net sales rising by 16.8 per cent over the previous year and net profit touching Rs 4.2 crore as against a net loss of Rs 3 crore last year. Operating profit rose by 8.8 per cent while gross profit rose by more than 250 per cent. The rise in gross profit, however, was mainly due to a lower non-operating loss in 1992-93 as against a non-operating loss of Rs 7.3 crore last year (mainly due to a one-time charge of prior years' electricity liability).

The modernisation programme carried out last year at its caustic soda plant yielded good results with reduced consumption of power. Production of caustic soda was higher by 9 per cent at 41,005 mt while that of benzene hexa chloride and stable bleaching powder was higher by 11.3 per cent and 15.9 per cent at 18,043 mt and 10,914 mt, respectively. Sale of caustic soda rose by 7.2 per cent in volume terms to 39,526 mt while that of stable bleaching powder rose by 19.5 per cent to 10,632 mt. Sale of lindane also went up with the increase in production volume and consistency in production of high quality material. However, sale of benzene hexa chloride was lower at 16,868 mt as against 17,036 mt sold last year. The year saw a lower production and sale of pentaerythritol, sodium formate, acetaldehyde and formaldehyde at the Ankleshwar division, which is being strengthened through backward and forward integration by the addition of new product lines. The capacity expansion of the formaldehyde plant to 33,000 mtpa was commissioned only in February 1993 while the expansion of the acetaldehyde plant's capacity to 5,500 mtpa was commissioned in April. The effects of the expanded capacity will be visible only in 1993-94. Production of cloth at the company's textile division was lower at 50.5 lakh metres (56.3 lakh metres) and the difficult phase obtained in the textile industry led to a fall in sale to 49.6 lakh metres (55 lakh metres). The unrestrained raw cotton prices coupled with the sharp increase in costs led to f pressure on margins. Production and sale of yarn on the other hand was higher at 6.2 lakh kgs (5 lakh kgs) and 6.4 lakh kgs (4.9 lakh kgs), respectively. The company's exports were higher by 28 per cent over the previous year at Rs 23.8 crore and it expects exports to rise significantly in 1993-94 due to the expanded capacity.

Encouraged by the good results obtained from the modernisation at the caustic soda plant the company has taken up another modernisation programme to further streamline production and conserve energy at various sections in the Renukoot division. Further it also plans to expand production capacity of lindane to 660 mtpa. Meanwhile the 150 lakh litres per annum distillery project at Ankleshwar is expected to be commissioned in the latter half of 1993-94. The company planned to finance its long-term working capital requirements and normal capital expenditure through a rights issue of 41,10,500 equity shares at a premium of Rs 15 per share in the ratio of two equity shares for every one held.

The company's four subsidiaries, namely, Aetka, Pipri, Kanoria Agro Products and Vidun Dealers posted higher net profits for 1992-93. Aetka, the largest among them and a wholly-owned subsidiary which has modernised its jute mill and diversified into new products saw a rise in its exports to Rs 23.8 crore (Rs 18.6 crore) while turnover rose to Rs 68.9 crore (Rs 56.3 crore). The subsidiary has, meanwhile, acquired a textile unit under a manufacturing agreement and is modernising the same to make it export-oriented.

For the 12 months ended March 1994 the company has proposed a dividend of 25 per cent following a more than 60 per cent rise in net profit. The company expects its financial performance to improve further as it has invested up to Rs 50 crore over the last two years by way of capital expenditure. It is also setting up a captive coal-based power plant at Renukoot in addition to proposing to further expand the capacity of its pesticide division along with formulations. To finance the power project and its expansion plans the company plans to raise capital through a Euro-issue or preferential allotment to foreign institutional investors (FIIs) and mutual funds to the extent of Rs 100 crore. It also plans to offer preferential warrants to the promoters.

MODI ALKALIES

Higher Sales

Modi Alkalies and Chemicals which is engaged in the manufacture of caustic soda, liquid chlorine, hydrochloric acid (100 per cent), stable bleaching powder, etc, has been promoted by the house of Modis (including

Modi Industries, Modi Rubber, Modi Spinning and Weaving Mills and Modipon). While the company's net sales rose by 22.3 per cent over the previous year, operating profit rose by 12.2 per cent and gross profit rose by 93.5 per cent despite a 54.4 per cent rise in interest charges following a sharp increase in short-term loans. The rise in gross profit was mainly due to a non-operating profit in 1992-93 as against a loss of Rs 4.5 crore (mainly comprising arrears of depreciation) in the previous year. Further, a less than proportionate rise in depreciation charges led to a four-fold increase in net profit. Despite the sharp rise in profitability the company did not raise the dividend rate but maintained it at 10 per cent.

Production at the company's plant at Alwar in Rajasthan was higher at 59,781 mt (58,185 mt) of caustic soda (116 per cent capacity utilisation), 40,751 mt (37,235 mt) of liquid chlorine (137 per cent capacity utilisation) and 10,083 mt (9,753 mt) of stable bleaching powder. With the company's exports rising by 27 per cent over the previous year, it has maintained its position as the largest exporter of caustic soda flakes in the country. In addition it has also started exporting TCE and it expects a substantial increase in such exports in the coming years. The company has taken up Total Quality Management (TQM) which is reportedly progressing well. It is also expected to receive ISO 9002 certification shortly.

Meanwhile the company's energy saving project was successfully commissioned as was its project for expansion of stable bleaching powder which was completed ahead of schedule and without any cost over-run. The caustic soda plant expansion by membrane cell technology which is in progress is expected to be commissioned by July 1994. The project which is being set up in technical collaboration with Asahi Chemicals of Japan will reduce energy consumption by 20 per cent as compared to the mercury cell technology. To part finance its expansion programmes the company entered the capital market with a rights issue consisting of 44,78,518 equity shares along with an equal number of detachable warrants.

The company earned a net profit of Rs 1.6 crore on net sales of Rs 37.1 crore for the six months ended September 1993.

ROCHE PRODUCTS

Exit Roche

Until recently a subsidiary of F Hoffmann-La Roche and Co (Roche), Roche Products improved its performance in 1992-93. The company is engaged in the manufacture of a wide spectrum of bulk drugs and specialities at its pharmaceuticals division in Bombay and fine chemicals at its works in Thane. While the company's net sales rose by 22 5 per cent over the previous year, a proportionately lower increase in operating expenses led to a two-fold increase in operating profit. Depreciation expenses were lower and despite a relatively sharp increase in interest charges and tax provision, net profit soared by more than 700 per cent over 1991-92. Despite the deceptive increase in profits, profit margins continue to be low with net profit margin at a mere 2.2 per cent. The rise in net sales and profits was mainly due to the timely price revisions approved by the government at fairly regular intervals towards compensation for the rising cost of raw/packing materials and other inputs. The erratic and inadequate availability of vitamin C, a major raw material for a number of the company's formulations, also affected operations and sales. Exports rose two-fold to Rs 58 lakh and the company raised the dividend rate to 10 per cent.

Following the consistent problems faced at the vitamin A plant which was installed 30 years ago, the company shut down stages 1 to 9 of production from April 1993 in order to carry out the necessary maintenance work which was expected to be completed in six to eight months. During the period of shut-down, it planned to maintain and even increase the production of vitamin A to the maximum capacity of last stage from imported acetrene for which it has received government approval. The final capacity after debottlenecking of specific stages is expected to reach nearly 90 mmu from the basic stage in addition to 40 mmu from imported acetrene. Effective from March 1993 the company initiated the phased take-over of distribution of Voltas' pharmaceutical products throughout the country.

Meanwhile, Roche, the Swiss multinational, which diluted its holding in the company from 89 per cent to 74 per cent in 1984, finally decided to end its 35-year association with the company by divesting its shareholding in favour of the textile tycoon, Ajay Piramal.

For the first six months of 1993-94 the company suffered a net loss of Rs 1.6 crore on a net sale of Rs 34.3 crore as against a net profit of Rs 55 lakh on a net sale of Rs 33.3 crore in the corresponding period last year.

DR BECK AND CO

Fall in Exports

Dr Beck and Co is engaged in the production of wire enamels and impregnating varnishes and synthetic resins at its works in Pimpri (Pune) and Ankleshwar (Gujarat). The recessionary trends in the domestic market, intense competition, liberalised imports and rising costs of inputs adversely affected the working of Dr Beck and Co in 1992-93. Though the company managed to maintain net sales at the previous year's level mainly through its marketing efforts and constant reviewing of its product mix, profitability fell drastically. While operating profit fell by 26.6 per cent over the previous year, a sharp rise in interest charges led to a 54 per cent fall in gross profit and though tax provision was lower by 50 per cent, net profit plummeted by more than 80 per cent. The rise in interest charges was despite the company's low percentage of debt to equity (9.8 per cent) and the fall in term loans over the previous year. After receiving the Top Export Award for its export performance in 1991-92, the company's export performance fell drastically in the very next year. Export earning which accounted for up to 37 per cent of net sales last year fell by 34 per cent and accounted for only 24 per cent of net sales in 1992-93, mainly due to the uncertainties in the erstwhile Soviet Union and the resulting imbalance in bilateral trade. Despite declaring a 20 per cent dividend last year the fall in profitability this year forced the company to skip dividend. A reduction in the percentage of imported raw material to total raw material consumed from 72 per cent last year to 52 per cent proved to be the only silver lining in its performance in 1992-93. Even the company's paints project at Satara was adversely affected due to shortage of funds.

Meanwhile, for the first six months of 1993-94 the company earned a net profit of Rs 20 lakh on a turnover of Rs 19.3 crore as against a net loss of Rs 1 crore on a net sale of Rs 15 8 crore in the corresponding period last year.

JINDAL PHOTO FILMS

Higher Profits

Jindal Photo Films is the largest player in the photographic goods business in the country and manufactures a wide range of products including colour paper, colour films marketed under the well known brand names Fuji and Super Plus, medical X-ray films, cine colour positives, graphic art films, industrial X-ray films and black and white photo paper. The company has a well established distribution network comprising over a hundred dealers throughout the country and has a technical and marketing tie-up with Fuji Photo Film Co of Japan, a Fortune 500 company.

For the year ended March 31, 1994 the company declared a total dividend of 40 per cent against a dividend of 30 per cent paid last year. Net sales for the period rose by 19.7 per cent over the previous year to Rs 262.4 crore while net profit shot up by 137 per cent to Rs 24.2 crore over the same period. Dadra, where the company's unit is located has been declared a backward area under the eighth schedule of the Income Tax Act and with the amendment of Section 80-IA of the Act through the Finance Act of 1994, the unit will enjoy complete tax holiday for an initial period of five years and will be allowed a normal deduction of 30 per cent for an additional period of five years thereafter.

MNEs Are Adjusting Their Sights

D N Ghosh

The MNEs have their own strategies for the highly competitive global market place and are impervious to the consequences of these strategies for the specific economies they happen to operate in. These consequences could be unpalatable for employment and for domestic industry and services.

LOW-WAGE developing countries have attracted many Multi-National Enterprises (MNEs) for the location of their production facilities. Technology is changing so dramatically that the low cost of labour is not necessarily an advantage; high-wage skilled input can add to the cost-effectiveness of many a technology-intensive industry. This is the fall-out of the new flexible production technology that relies on a highly trained and motivated labour force, continuous innovation and just-in-time delivery of components, with a flawless network of transport and communication. In many industries the share of low-skilled labour in production cost has been rapidly falling—from around 25 per cent in the 1970s to perhaps 5 per cent or 10 per cent today. This is the conclusion of a study by Charles Oman for the OECD Development Centre. The study also highlights another critical factor which threatens to take low-wage or even semi-skilled jobs away from low-wage developing countries. Increasingly there is the important tendency to be as close to the customers as possible and this is bringing about movements within regions rather than across regions. In Europe operations are likely to move away from Germany to Portugal or eastern Europe rather than to Latin America or Asia. Production for the North American market is more likely to move to the low-wage areas in the US and to Mexico. The low-wage economies, even if they are uninhibited in their outward orientation policies, can have no assurance of any permanent benefits.

But the reform programme is not that unmindful of efficiency and productivity. Privatise the state-owned enterprises and the problem will solve itself. There will be pain initially but in the long run it will sort itself out. Will it? The struggling economies can hardly be effective in their protest, for the MNEs have to listen to the market and not to tales of woe. But then refer to the recent findings of a few first-world research institutions. A joint study by six European institutes—Cambridge Econometrics (UK), Ifo institut fur Wirtschaftforschung (Germany), BIPE Conseil (France), Prometeia (Italy), NEI (Netherlands) and Wifo of Austria—forecasts that, in the period between 1992 and 1998, 8,00,000 jobs will be lost in 120 companies in the European Union and European Free Trade Union. These companies employ more than 3.5 million people and have annual sales of more than $ 464 billion. The expected job losses are in France (2,90,000), Italy (1,80,000) and Germany (1,40,000). The main industries concerned are telecommunications (2,68,000), energy (2,50,000) and transport (77,000). The estimates are based on the experience of five British privatised industries—steel, gas, airways, telecom and electricity. The public undertakings in these five industries shed more than 3,00,000 jobs in the 1980s. The study further predicts that if restructuring is specially severe, 1.1 million jobs could be lost. Privatisation, the study avers, is bound to become a big political issue in Europe.

For the highly developed economies a small upward movement in the unemployment rate becomes a matter of serious political and economic concern, cutting across political and academic affiliations. For the struggling economies undergoing the reform therapy, this is a pain and a burden they must learn to bear. When you join the order of the Jesuits, you must accept its method: the argument and dialogue are predetermined; if you wish to have the solace of getting the right answer, you must adjust to the right method. For the MNEs, the prime movers of the reform process, the two policy prescriptions of globalisation and privatisation go hand in hand. They cannot remain content with wholly-owned subsidiaries or their affiliates; as they are driven by competitive pressures to augment their assets and fortify entry barriers, their strategy to secure control over state undertakings, either directly or indirectly, through association with local industry and business does make sense.

In some of the key technology-intensive and technology-driven industries, the process of opening up and globalisation are inducing many MNEs to make their entry or to reactivate units which happen to be here. The benefits that are by and large accruing to the economy in terms of efficiency and productivity are undeniable. The MNEs have, however, their own strategies in the highly competitive global market place and the ruthless world of competition cannot but make them impervious to the consequences of their strategies for the economies they operate in. More often than not, these consequences could be unpalatable and unacceptable, not only in terms of employment but their impact on the ordering of domestic industry and services. We have to guard against complacent policy stances which advocate growth at any cost, regardless of the consequences of the strategies of the global MNEs. Mature economies have resources to ride out the storm but for the developing economies any minor disturbance has the potential of developing into a crisis.

Efficiency, productivity and employment are objectives to be simultaneously pursued. The gamut of current reform measures cannot ensure that; these have to be combined with a strong set of state interventionist measures. The countries which were swept off by the euphoria of reform are rethinking their strategies. That shift in focus appears vital for the survival of those polities; otherwise, globalisation and privatisation, in combination, would be a lethal medicine.

NEW DELHI

Lessons of the Sugar Muddle

BM

The government administration, at the highest levels, has acted in a totally confused manner in dealing with a relatively routine problem: the periodic decline in the production of sugar. The worst performance has been that of the much-vaunted PMO which has made a habit of interfering in the day-to-day functioning of government ministries and departments and then disclaiming all responsibility when things go wrong.

THE spurt in sugar prices has put the government in a spot. The cycle of bumper production of sugarcane and factory sugar followed by a relative decline is a familiar phenomenon. This naturally poses problems as regards both supplies and prices of factory sugar, in particular in urban areas. Never before, however, has the government been found to be so amiss in handling these problems which should ordinarily be relatively easy to manage. There is utter confusion and the internal wranglings and conflicts in the government are of a kind and scale never witnessed before. The result is that what might have passed for a muddle has become yet another scam with large administrative and political dimensions. The prime minister, however, continues to act in his characteristic evasive and dithering way. He has thus opened himself and the coterie over which he presides in this matter too to questions of competence as also of integrity. The much-advertised cohesion in the government, with Narasimha Rao firmly in the saddle, has been found in this matter too to be a myth which the managed media has lately been trying so sedulously to propagate.

Narasimha Rao has promised to look into the files to find out what went wrong and fix responsibility. But he will take his own time to do this. There is no question of anything coming for several months from such a bureaucratic probe, certainly not before the state assembly elections due to take place a few months hence. The only considerations that weighs with Rao are of a short-term political-electoral nature. So far as 'damage control' measures are concerned, the only way Rao finds open to him is to arrange import of sugar in a hurry at prices which will give hefty profits to the international sugar cartel as well as sugar traders and producers. Whatever the cost in foreign exchange, which is supposed to be so plentiful that there is no hesitation in the government in squandering it, and whatever the subsidy from the exchequer which will be involved in its sale of the imported sugar in the domestic market, imports of sugar is still being given top priority. It is a pity that the opposition parties, including the left parties, have also been persuaded to clamour for instant imports to give relief to the 'consumer' and their only criticism of the government is that it delayed the imports and is now importing sugar at prices which have meanwhile spurted in the world market. The point that they miss is that the prices of sugar in the world market were jacked up by the international sugar cartel as soon as the government of India decided to go for imports rather than judiciously manage available supplies of domestic sugar and regulate its consumption and prices in the domestic market.

ROUTINE SITUATION

The fact, after all, is that sugar production in India touched a peak of 134 lakh tonnes in 1991-92. The latest official estimate is that production was 98 lakh tonnes in 1993-94. This estimate has been arrived after a series of downward revisions which may actually need to be questioned. The carry-forward stock of sugar is estimated to have come down from 40 lakh tonnes at the close of 1991-92 to 17 lakh tonnes at the start of the 1993-94 sugar year in October 1993. There has been large-scale diversion of sugarcane to khandsari and gur even while sugarcane producers have enjoyed a price bonanza. The pressure on the price of factory sugar, therefore, should not be seen in these conditions as too difficult to manage nor should it have led to a panicky reaction in the government of going in for large-scale imports at fancy prices. The policy for the past many years has been to cope with the sugar cycle through the system of dual pricing. A part—to start with two-thirds and in recent years of good production one-third—of available supplies is sold through the public distribution system at fixed prices. The rest is allowed to be sold in the open market to fetch market-determined prices. This arrangement has worked well over the years without the exchequer having to subsidise the consumption of sugar or large-scale imports having to be effected. Industry has been in a position to supply levy sugar a[t] prices based on the statutory price fixed b[y] the central government for sugarcane. True the state governments fixed cane prices a[t] higher levels, but the industry could recove[r] these higher prices from the sale of sugar i[n] the open market. It is ironic that under th[e] so-called market-oriented liberalisation polic[y] and notwithstanding the commitment t[o] eliminate subsidies, the government has lande[d] itself in a situation where it has to import nearl[y] a million tonnes of sugar through public agencies in addition to whatever is imported on privat[e] account, and bear a subsidy of as much R[s] 500 crore on the imports if they are sol[d] through the public distribution system. Thos[e] **who are making the delay in arranging imports as the principal issue of criticism of the government's sugar policy are taking a** narrow view in the name of the consumer, essentially the urban middle class consumer.

To start with, however, sugar producers and traders were allowed as early as in the middle of March this year to effect duty-free import of sugar under Open General Licence for sale in the open market. This was done when the price of sugar in the open market had just begun to rise. The imports were supposed to augment supplies in the open market and bring about a balance between demand and supply and thus protect the consumer. What the government failed to reckon with, under the spell of its so-called market-oriented policies, was that the imports were bound to be so arranged and releases in the open market so managed that they would only enhance the profits of the sugar producers and traders without giving any relief to the consumer. The imported sugar only swelled the stocks with the sugar producers and traders and gave a boost to their profits. Import of sugar by public agencies to feed the public distribution system should have been considered as the only relevant measure to discipline the sugar market. But the international sugar cartel had in the meanwhile also jacked up prices and so import of sugar by the public agencies had to be at inflated prices, necessitating a large subsidy if the imported sugar was to be sold through the public distribution system. It is pointless to criticise food minister Kalpnath Rai for standing in the way of "timely" import of sugar by the public agencies. He has advanced very good reasons for not allowing the Food Corporation of India to dabble in imports of sugar. To begin with, the official policy was to effect imports through producers and traders. Subsequently, when the government decided in favour of import by public agencies, the STC was obviously the more competent agency than the FCI for the job. The STC first hesitated because the question of the subsidy on the

sale of the imported sugar had not been clarified; subsequently it found it necessary to go for dubious arrangements to import in a y sugar already on the way to India on private account. The way the sugar imports have been handled shows that notwithstanding the official hang-up with private business as being 'efficient', the government finally has found it necessary to dragoon STC into the job. Evidently, the STC is not able to make profits by exploiting shortages in the market in the manner of industry and trade after throwing some crumbs to corrupt bureaucrats and politicians.

SQUANDERING FOREIGN EXCHANGE

The sugar muddle has also highlighted the fact that the government is now ready generously, indeed recklessly, to spend foreign exchange reserves to meet the current consumption needs of the more articulate sections of population, especially the urban middle class, for purely populist reasons. It has been assiduously 'sterilising' the inflow of foreign currencies in various forms and under a variety of arrangements and has not found it possible to invest them in the creation of new assets and growth of the economy. For investment and growth, reliance has been placed entirely on foreign private direct investment and the government has gone out of its way to facilitate such investment. Indian enterprise in both the public and private sectors has been discouraged from mobilising resources, domestic and foreign, for stepping up investment. This is considered inflationary, whereas spending exchange reserves on current consumption is preferred as anti-inflationary.

Often it is even argued by political leaders and administrators that a level playing field for domestic industry is not feasible if the flow of foreign capital has to be kept up. This, of course, makes a mockery of the principle of competition which is supposed to the very basis of efficient operation of economic agencies, foreign as well as local, in the market. If indeed the purpose of market-oriented liberalisation is to increase competition, there is obviously little justification for offering more favourable terms for foreign capital than are available to Indian capital. The objective of bringing Indian industry up to global standards has in this process been discarded and official policy is now frankly concerned only with creating conditions for attracting foreign capital, as a substitute for rather than as an additive to domestic resources, for development. Foreign capital is being relied upon to displace public sector industrial and commercial enterprise and occupy the commanding heights of the economy under state protection and with state assistance and without having to face competition from Indian enterprise, in the public and private sectors. In the case of the consumer goods sector as well the same policy is gaining ascendancy and will come to prevail sooner rather than later. The preference for import of sugar to manage supplies and prices is not at all surprising in this context.

The sugar muddle is not a case of malfunctioning of the government and its administrative machinery. Whatever has transpired in the regulation of supplies and prices of sugar has been directly influenced by concerned interest groups. Ministers have taken positions without a semblance of a coherent and collective view of the issues at stake. If the food minister, Kalpnath Rai, has been eager to promote the interests of the sugar industry and the agriculture minister, Balram Jhakhar, those of cane growers, Manmohan Singh has been concerned with the burden of subsidy on the sale of imported sugar under the public distribution system. Commerce minister, Pranab Mukherjee, was reluctant to undertake imports without clear directives as to the sale of imported sugar in the domestic market. The upshot has been dithering by ministers and senior bureaucrats out of which foreign suppliers and local traders have extracted large profits. Even the legitimate interests of cane growers and the sugar industry have gone by default, let alone those of consumers at large. It is still a matter of argument within the government whether the sugar imported by STC will go into the public distribution system or a large part of it will be attempted to be pushed into the open market to minimise the subsidy.

The institutional set-up of the governance has been visibly strained in what should have been a relatively simple matter of efficient management of the supplies and prices in the face of a drop in the production of factory sugar, even though there was no large shortfall in the production of sugarcane. The dual pricing system was, in these conditions, an efficient arrangement for keeping the sugar market relatively calm and under meaningful social control. Judicious regulation of sugar releases for the public distribution system and for sale in the open market could have kept prices of sugar under check and obviated the need for imports. But the government administration, at the highest levels, has acted in a confused manner. The worst performance has been that of the much touted PMO which has made a habit of interfering in the day-to-day functioning of ministries and departments and then disclaim all responsibility when things go wrong. The row over the move by a bunch of senior bureaucrats, in which the hand of the PMO has been widely and rightly discerned, to involve the Food Corporation of India in the import of sugar bypassing the minister-in-charge, which Kalpnath Rai scotched is a matter of public concern and needs to be thoroughly probed. The admission that the prime minister had called for the import of sugar just before his departure for the US and the subsequent denial by the PMO of involvement in dragging the FCI into the arrangements for effecting the imports have emphasised the casual manner of functioning of the prime minister and his office.

WEST BENGAL

Bankrupt Landlord's Bailiff

Ajit Roy

The perceived correlation between Jyoti Basu's summer vacations abroad and convulsions in West Bengal may perhaps be viewed as an objective testimony to the chief minister's crisis-management talents. Be that as it may, the distinguishing features of this season's eruptions are their multiplicity and the clearly exposed roots of some of the issues in the existing socio-political structure.

WEST BENGAL chief minister Jyoti Basu's recent trip to North Korea and China has been marked by the usual phenomenon. His by now fairly regular summer vacations abroad are generally followed by serious turmoils in his domain. This perceived correlation between his absence from and convulsions in the state may perhaps be viewed as an objective testimony to his crisis-management talents. Be that as it may, the distinguishing features of this season's eruptions are their multiplicity and the clearly exposed roots of some of the issues in the existing socio-political structure itself.

Two of the more dramatic turns of events concerned the working class, supposed to be a special concern of the CPI(M). On May 9, Texmaco, a large steel-fabricating enterprise owned by the Birlas and having a good rapport with the CPI(M)'s CITU-led union, came out with the announcement that its wagon-making unit employing about 3,000 workers would suspend operation from May 15, while two other divisions employing around 1,000 workers would be closed down from June 1. All this, because the government of India's Railway Board had placed no orders with the company even though its budget for the year had made provisions for making 18,000 wagons. The spokesperson for the management further said that it had failed to pay the previous month's wages to the workers. He paid a tribute of sorts to the trade union leaders for their considerate conduct. "I am grateful", he was reported to have said, "to the trade union leaders who have maintained peace and tranquillity. The workers could have run riot. This will lead to industrial havoc and vitiate the entire industrial atmosphere of West Bengal and severely damage its prospects of attracting investments."

While holding the 'political conspiracy' of the central government responsible for the factory's crisis and at the same time blaming the management for the illegal suspension of work, the CPI(M)-controlled union spokesperson also ended by conceding that the management had "difficulties too".

The seriousness of this development arises from the fact that the eight wagon-making units of this state give direct employment to about 50,000 workers. It needs to be mentioned here that it was the crisis of this industry in the mid-60s that had set off the sharp decline of industrial activity in West Bengal, from the repercussions of which the state has never fully recovered.

While the leaders of the CITU union proposed a gradual build-up of the movement to lead to a strike in the wagon industry, its leaders made it a point to declare that they had no immediate plan for launching a rail-roko agitation to realise their demand.

'Rail roko' being a very sensitive issue for the 'law and order' functions of the Left Front government, a threat to resort to this action led to a more drastic denouement at another spot in the state. The next day, that is, on May 10, the independent Shramik Sangram Samity (SSS) of the Kanoria Jute Mill workers had to pay the penalty for its indifference to this sensitive issue for the Left Front government. The SSS leaders had been on hunger strike since May 3 as a run up to the contingency of rail roko for realising their demand for the reopening of their closed mill. As the D-Day was nearing, in a surprise move the state police swooped down upon the SSS leaders at the dead of night. Facing resistance, the police resorted to lathi-charge and firing of teargas shells Along with the fasting union leaders, dozens of workers were also arrested, the union booths were demolished and prohibitory orders issued banning assembly in the area

This deepened the crisis Not only was the police action condemned by the large segment of Left opinion which had rallied in support of the Kanoria workers from the beginning of the struggle, it also revealed serious rifts within the Left Front. Though Jyoti Basu was reported to have justified it from the North Korean capital, spokespersons for the CPI's AITUC, Forward Bloc's TUCC and RSP's UTCC criticised the police action as a gross violation of the Left Front's declared policy of non-interference with peaceful trade union struggles

As the arrested SSS leaders continued their fast in spite of their confinement in hospital under police custody, the government seemed to be at a loss about its next step. Ultimately, after some parleys its emissaries were able to arrive at some vague compromise. The union demanded a loan of Rs 70 lakh for running kitchens for the unemployed workers and their families till they succeeded in reopening the mill. Whether the state government agreed to the proposal is not clear, but it promised to co-operate with the union in moving the high court for securing the release of the finished products within the mill for sale and using the proceeds to meet the workers' claims.

The state government's constraints should not be under-estimated. Its rather straitened circumstances apart, it could not set a precedent of cash loans likely to spark off similar movements in dozens of factories in the jute, engineering and other industries in about the same situation as Kanoria. Neither is it in a position to browbeat nor vigorously repress the Kanoria workers

While these two developments were but the manifestations of deep crisis of the state's two leading industries—jute textiles and engineering—the decay of the state's infrastructure in some areas was brought home, when the lawyers practising at the police courts of Howrah and Alipore, the first being the twin city and the second virtually a part of the state capital, started boycott of the courts and even the high court advocates abstained from work for a day in sympathy. The lawyers were demanding safer accommodation for the courts as the present dilapidated structures were condemned as unsafe. Ultimately the agitations were withdrawn when the government promised some substitute accommodation for the present and a time-bound programme of construction.

This period also witnessed a minor disturbance in the Jadavpur University (JU), in south-east Calcutta, centring around a dispute between a section of students and the teachers. Then there is the annual visitation of gastroenteritis in the metropolis.

The engineering students of JU declared an indefinite fast while the teachers protested the alleged victimisation of one of their colleagues. There was also a minor clash between supporters of the two camps within the campus. While one is not fully informed about the JU affairs, the minor epidemic in Calcutta may certainly be held as a product of the poor condition of the city's water supply system, in which the old and leaking water mains and sewer run side by side, leading to inter-flow of the two streams on occasions. The perennial resource scarcity of the Calcutta Municipal Corporation precludes any radical solution of the problem.

The basic factors giving rise to popular discontent and unrest may not always be due to direct or deliberate defaults of the state government. They may often be the results of national policies, more particularly inequitable or injudicious use or misuse of the extremely scarce resources of this poor country and class policies of the ruling circles. The state government, under the present dispensation, lacking as it does any control over basic decision-making, is, however, saddled with the responsibility of managing crises arising for systemic defaults, including on occasion pacification of irate subjects. This is similar to the role of a bailiff of a bankrupt but prodigal landlord, who however has to manage the estate of an absentee landlord!

Fifth Pay Commission: On the Beaten Track

K P Joseph

Not much thinking has apparently gone into drafting the terms of reference of the new Pay Commission. Though the problems of pay determination now are rather different from those faced by the government ten years ago, what has been done is to blindly copy the wording of the last Pay Commission's terms of reference.

THE Fifth Central Pay Commission was appointed by the government of India on April 9, mainly to consider the revision of the pay and allowances and the pension of central government employees. It is customary in the central government to have Pay Commissions at intervals of approximately 10 years.

The timing and terms of reference of the present Pay Commission would seem to be rather odd. Central government employees are now fully compensated for the increase in the cost of living by half-yearly increases in dearness allowance. The total expenditure on salaries of central government employees other than those in the defence forces this year is estimated in the budget to be Rs 6,760 crore and the dearness allowance Rs 8,700 crore. It cannot be argued that the central government employees suffer much hardship because of higher cost of living. But it will be evident to anyone who has looked at this year's budget documents that the central government is entering a period of serious financial difficulties. The fiscal deficit this year is estimated to be Rs 54,915 crore; the payment of interest on debt (expenditure over which parliament has no control as it is a 'charged' item under the Constitution) is the astronomical figure of Rs 46,000 crore—twice the entire defence budget. It is perhaps not necessary to cite figures to show how non-plan expenditure is edging out plan expenditure, as most people are aware of this alarming trend and government is constantly apologetic but helpless about it. Only a few years ago both the fiscal deficit as well as the interest on debt were well below Rs 10,000 crore. The expectations of the central government employees from the Pay Commission are bound to be great and there is no doubt that the recommendations will add to the financial burden of government, which is almost unbearable now.

Not much intelligent thinking has apparently gone into the drafting of the terms of reference of the new Pay Commission, which is the work of the expenditure department of the finance ministry. In government precedent matters a lot. What has been done is to blindly copy the wording of the terms of reference of the Fourth Pay Commission. Due to the possible shrinking of the public sector because of disinvestment and the economic reforms policy and the increasing demands of state government employees for pay parity with their colleagues in the central government, the problems in pay determination now would be rather different from those faced by the government ten years ago. There is no sign that the finance ministry was aware of this, when drafting the terms of reference.

There has been no effort so far to evolve even the rudiments of a national wage policy in India nor any systematic effort to study the wage problem. A quotation from the Report of the Fourth Pay Commission (1986) will help us to understand the extent of the vacuum that exists in this field:

> We thought of having advice of some of the professional institutions on wage and salary matters. We wanted to know if any study had been undertaken on salaries and wages of employees in general and on problems of pay of central government employees in particular. But no such studies were available.

The literature available to the Fourth Pay Commission about what other countries were doing about pay determination was so scanty that it had to take the assistance of the ministry of external affairs to obtain material from abroad. Information was received from 10 countries, including Britain, the US, Pakistan, Russia and Nigeria. A reading of the report, however, shows that only information received from Britain was used and that much of it was only of historical interest (like the report of the Tomlin Commission of 1931) and had no practical application or relevance in Indian conditions. Parts of the report that discuss the abstract principles of pay determination border on the naive, like the following passage:

> As is well known, next to rainfall, the most important factor contributing to the happiness of people in our country is efficient administration. And that cannot be secured without a satisfactory pay system.

The Fourth Pay Commission was of the view that the more money the government pays to its employees, the harder will they work. Its recommendations for higher pay and allowances were completely accepted by the government but nobody has claimed that productivity in government has improved as a result.

The Fourth Pay Commission tried to make up for the lack of data and information available to it by inviting interested organisations to submit memorandum containing their views on matters covered by the terms of reference. The commission received 8,500 memoranda. To supplement this effort, the commission later issued a questionnaire to more than 2,400 organisations and individuals. The questionnaire contained 124 main and over 70 subsidiary questions calling for information on a bewildering range of points. To say the least, it is a bizarre document. A few examples chosen at random will help to convey its flavour:

(1) What is your assessment of the state of the national economy?

(2) What is your assessment of the resources of the central government?

(3) Can you suggest a practical and reliable method for assessing the government's capacity to pay its employees?

The Fifth Pay Commission has already issued invitations for submission of memoranda which have to cover each item in the terms of reference separately, on computer floppy or in seven copies.

There is every possibility that, as in the invitation for memoranda, the Fifth Pay Commission may try to do what the Fourth Pay Commission did and issue a long questionnaire. It is to be earnestly hoped that the questionnaire will be a much shorter and less rambling document meant to elicit relevant information. One can easily imagine the mountains of unnecessary paper that will pile up in Delhi if the Fifth Pay Commission also goes in for a questionnaire of the old type.

It is to be doubted if study of ways to improve the efficiency of government is a legitimate task of a Pay Commission, as the terms of reference would suggest. The recommendations of the last Pay Commission about increasing pay and allowances of the employees were not only accepted and implemented in full but some additional concessions were also given, according to the annual report of the finance ministry covering the period. The last Pay Commission itself said at the end of chapter 7 of its report that pay increases have "to be fair from the point of employees as well as the people they serve". While considering the recommendations of the last Pay Commission, the government of India completely ignored this and did not implement important recommendations like the following:

(1) Reducing proliferation of posts at the senior level like Director General of

Police and other departmental heads created for "the benefit of an employee or class of employees" or to relieve "stagnation".

(2) Reduction of surplus personnel in all departments.

(3) Dealing with the increasing lack of integrity among government employees.

(4) Review of the scheme of bonus payments in government departments.

(5) Review of the working hours.

Due to the failure of the government to take measures to deal with any of these important recommendations, the position has deteriorated alarmingly in each of the areas mentioned above.

A single instance of proliferation of posts at senior levels directly under the ministry of finance, which figures in its annual report placed before parliament, will help us to understand how serious is the problem. There are over 300 posts of the rank of Commissioner of Income Tax and above under the Board of Direct Taxes. The corresponding number of posts in the Board of Indirect Taxes is only about 130. The Board of Direct Taxes collects only 13 per cent of the total revenue according to this year's budget; the Board of Indirect Taxes collects 36 per cent. The number of Income Tax Commissioners for assessment is over 100 and the number of Income Tax Commissioners (Appeal) over 140. According to a recent newspaper report the Board of Direct Taxes itself admits that tax evasion would be around Rs 30,000 crore.

All over the country in almost every department of government, both central and state, a similar cancerous growth in the number of departmental heads can be seen. Neither this nor the other four issues raised by the last Pay Commission and mentioned earlier can be solved in a short time. But it is unfortunate that nothing has been done by the government to examine them or find solutions.

It is but natural that these very issues will find a place in the report of the Fifth Pay Commission also as these are the root causes for the growing inefficiency in government and the alarming increase in non-plan expenditure. Instead of turning a blind eye to all this, it will be far better for the finance ministry to set up a cell to consider these matters now and suggest a workable timetable to solve them to a substantial degree. They should not find a place in the report of the Fifth Pay Commission. The taxpayer has a right to insist on value for money, which he is certainly not getting on the additional financial burden due to the implementation of the last Pay Commission's recommendations.

At the time of independence there was wide disparity between the pay scales in the central and state governments. This disparity increased when the public sector grew in size and many of the public sector units increased salaries in spite of occasional instructions to the contrary from government. But in recent years the unions in the central and state governments and the public sector have succeeded in levelling down the differences in the rates of salary. The implementation of the recommendations of the last Pay Commission's report itself gave rise to a series of strikes and agitations in some states for higher salary.

In an extreme case like that of Kerala, the Congress Party itself promised in its election manifesto in 1991 that, if it won, pay parity with central government employees will be given in the state government. This was done at a time when the employees of Kerala government enjoyed perks not available to central government employees. Congress won the election. To pay the higher rates, the state government pleaded before the Finance Commission recently that the central government should meet the additional cost for giving pay parity. There are constant agitations going on all over the country because of the difference in salary rates between governments.

To find a practical solution to this difficult problem the chief minister of Karnataka wrote to the prime minister, while the work of the Fourth Central Pay Commission was in progress, suggesting a meeting of all chief ministers to find a common formula for pay determination. Unfortunately the government of India turned down this reasonable suggestion saying that each government was competent to prescribe the pay scales and allowances of its employees. This was very short-sighted; much loss of working hours could have been avoided if some rough understanding was arrived at between the various governments and the unions. It will be sensible for the government of India to have another look at the letter of the chief minister of Karnataka to the prime minister and come to some general understanding about salary rates. This has to be done early enough so that the Fifth Pay Commission can make use of it in framing its recommendations.

India is the only big country in Asia that has a five-day week for government employees. With the inadequate public transport in our cities and the large number of women employees who have to attend to their children and their problems, it is inevitable that working hours cannot be rigidly insisted on in India as in the developed countries. A study conducted by academics in Maharashtra some time ago showed that productivity has declined as a result of the introduction of the five-day week in the Maharashtra government. The central government has not conducted any studies. To a question in parliament, the government reply was that there is no proposal to reconsider the decision about five-day week as there is no demand from the employees! Working hours are certainly linked to the rates of remuneration and have to be agreed upon between employer and employee in such a way that the interests of the taxpayer do not suffer and that he does not have to pay more for less work.

Other than those who actually deal with the immense load of work that results from the implementation of the recommendations of a Pay Commission, nobody can have any idea of how laborious it is. Some of this is due to giving retrospective effect to the benefits, necessitating extensive recalculations. Another reason is that the existing regulations about salary and allied matters are extremely complicated. The most important of these is a manual called 'Fundamental Rules', which came into force not long after the first world war and which was designed by the Englishman to effect the maximum economies during a time of financial difficulties. Some of the rules like Fundamental Rule 22 are so complicated that it has become something of a science in government offices to interpret them. These rules can be simplified very considerably and without much effort. The way increment or efficiency bar is operated is also cumbersome. Making necessary changes in all this together with the avoidance of retrospective effect for benefits given by the Pay Commission to the extent possible would be an immense saving of labour and money in government.

But has the finance ministry the necessary skills and the will to undertake these unusual tasks? Postponing decisions on these issues would be a sure recipe for bigger budget deficits, less productivity and an invitation to all state government employees to take to the warpath.

KARNATAKA

Burdens of Interpretation

The case of Kannappa

Sudha Sitaraman

The shameful incident in Kolar district of Karnataka of forcing a dalit to eat his own excreta, as a punishment for his alleged offence of verbally abusing an upper caste political leader, and the responses it has aroused reveals the hypocrisy of the state, the police, the political leadership of all parties with regard to the social location and the rights of dalits.

HARATI, a small village in Kolar district, of Karnataka, hitherto remote topographically has become the site of a major political ...ion in the last couple of months. There are several reasons for this. The shameful incident of forcing a dalit, Kannappa, to eat his own excreta took place in this village thus upsetting the complacent notions of absence of human rights violations, except as being 'aberrations to the rule', as 'reactive' or as being 'mishaps' in the country. That there prevails a high dalit consciousness in the district turned out to be a myth. Soon after the incident was reported in the press Dalit Sangharsha Samiti (DSS) issued a press statement denying the very occurrence of the incident. Adding to all this was the total inertia of the opposition parties to make this ... issue, as is customary, in spite of this being an election year, after an initial murmur created by Janata Dal.

In the last few months there also emerged many versions of the incident. The various versions of the incident are directly proportional to the number of people who have deliberated on it. Where does one stand on the question of Harati? A provocative question, but an interesting one against the wide background of versions. Apart from the press which gave wide coverage to the incident there were nearly 10 statutory and non-statutory bodies that sent fact-finding teams to look into the truth value of the ...ident, all of whom came up with different ...ions or interpretations on the incident. One of the effects of these has been a discovery that there is no one point of view, no vantage, no perspective available like an Archemedian principle. So ideologically saturated is Harati that any one who comes to deal with it, even superficially, has to take a position and defend an interest. The general imagery used to represent the incident especially by the press and to some extent other organisations has been 'conflicting reports on Kolar incident'.

Concern over the very occurrence of the incident became almost chronic when DSS, ... district, stated that the incident could not have taken place and the dalits were being used as pawns by vested interests. The logic given in support of this argument was that as the district was known for its high level of dalit consciousness, the incident could not have occurred.

Kannappa, the victim of the incident had a different story to tell. He is a landless dalit from Kotiganahalli, Kolar district. Narrating the incident Kannappa stated that he came to Harati on the night of January 28, 1994 to buy coarse rice from a shop. He encountered Venkatarame Gowda, a defeated Congress leader from Harati. Venkatarame Gowda asked him to announce the advancement of Deepotsava, a local festival. He said that the Congress wanted the festival on January 29 instead of January 30. The local festival called Deepotsava, customarily held on a particular day was to be announced to the public through the tom-tom. The Deepotsava was scheduled to be held on January 30, 1994 (Sunday) on general consensus between both the parties in the village. Venkatarame Gowda had gone to Kotiganahalli earlier and paid an advance of Rs 20 to Kannappa to do the tom-toming. But on January 28 evening, he had changed his mind. Kannappa could not accept the sudden demand as he had promised to work for somebody the next day, and he refused to comply with the orders. Then Venkatarame Gowda demanded the return of the advance money. Kannappa said he did not have any money and as agreed he would do the job of tom-toming only the next day. Infuriated Venkatarame Gowda dragged Kannappa towards his house which was just 50 feet away, tied him to a pole and kicked him on the stomach. Others, such as Ch...pati, Venkatarame Gowda's brother, Muniswamy, Chikka Venkataramanappa, Rukminamma (Venkatarame Gowda's wife) and Sharadamma beat him. Out of fear Kannappa defecated on the spot. This made Venkatarame Gowda and members of his family more angry and they could not bear a dalit defecating and polluting their premises. Gowda's wife took a broom-stick to transfer all the excreta on to Kannappa's head and body. Gowda forced the stick dipped in the excreta into Kannappa's mouth.

Venkatarame Gowda, on the other hand, when asked about the incident, said that Kannappa came to Harati on the night of the mishap and being drunk was heard to have abused him using foul language. Having come to know of this through neighbours he personally went to meet Kannappa to ask him not to indulge in such misconduct. Having failed to convince Kannappa, he took him home to give him a piece of onion and buttermilk to mitigate the effect of the alcohol.

D M Sirsikar who was on duty in SNR Hospital, Kolar on the night of the mishap has recorded the details given to him by Kannappa about the incident when he came to the doctor for medical aid in the early hours of January 29. The details as recorded in the accident register read that Kannappa came in the early hours and complained that he was tied up and beaten up by Venkatarame Gowda who at the same time poured 'payasam' (a sweet dish prepared generally on auspicious occasions) on his head and put excreta into his mouth. Recording this incident the doctor writes that he located 12 injuries on the body of Kannappa and that a foul smell emanating from his mouth. There were also marks on his body which suggested that he could have been tied up.

The superintendent of police narrating the incident stated that on being informd by Nagarajaiah and Hanumappa he came to know that Kannappa came to Harati and abused Venkatarame Gowda standing in front of the temple of Sri Ram. Venkatarame Gowda and others pleaded with Kannappa not to indulge in such behaviour. When Kannappa could not stop himself from doing this, Venkatarame Gowda gave him an onion and buttermilk. The police officer also states that Kannappa was not made to eat excreta. Sub-inspector Umesh of the Kolar rural police station was suspended for not procuring the medical certificate in time. Yet, without the certificate the police came to the conclusion that the incident did not occur.

Legislature Committee Report

The legislature committee on the welfare of SC/ST tabled its report in the legislature on March 28. The committee found that political animosity between rival parties was largely responsible for concoction of the event. A few "miscreants" like D Rajendra ("a brahmin"), Hanumappa and Dasappa ("vokkaligas") of Harati village as also Varadappa and Seenappa of Kotiganahalli have indulged in the exercise with the sole intention of maligning Venkatarame Gowda's name. Taking into consideration the prime piece of evidence that is available, the committee said that "according to the statement given by the doctor and the medical certificate and also report of the laboratory, there is no proof regarding Kannappa being made to eat stools. But the injuries seen on the body of Kannappa might have been caused on account of beating... Also in the medical certificate the statement that Venkatarame

Gowda had poured 'payasam' on the head of Kannappa is unbelievable".

It is here worthwhile to take into consideration the ways in which influential segments of the intelligentsia have responded in to the incident. During the debate on the floor of the house on February 8, the chief minister of Karnataka, Veerappa Moily, categorically said that the incident never really happened. He said "there is no question of hushing up the case of shielding anybody. If it is done it will amount to a grave sin. I and my government do not want to bear this sin." He is reported to have added that, if there was an "iota of doubt which could prove that he was backtracking on the issue or forcing the police to get a concocted report he would not sit in his chair".

Given the umpteen versions, the precise sequence of events within which the incident is to be placed both in terms of objective conditions of possibility as well as individual biographies has been contested. The official version of the event is challenged by alternative interpretations. Moreover, the so-called official version given to us either by the police or by the chief minister and finally by the legislature committee do not tally. In the process, Kannappa's statement with regard to the incident has been completely ignored. It is our contention that the meaning attached gets differently constituted in the process. The important point is that this incident throws light on not only questions of truth and falsity but also on alternative interpretations as constituting the meaning of the incident for people in different social positions.

The task of fixing either the authentic understanding of the incident or its origin is not an easy one. It must not be forgotten that the victim is a dalit and also a landless labourer, and Venkatarame Gowda, the prime accused in this case, a defeated Congress leader. He is also the taluk president of Congress and by virtue of the position, he is close to Nissar Ahamed, a minister in Moily's cabinet. Though he is a middle peasant, because of his caste (vokkaliga) and proximity to the political leadership, Venkatarame Gowda wields a lot of power, not only in Harati but in the surrounding villages also. But surprisingly he lost in the recent panchayat elections to the Janata Dal. Beating up people (including a forest guard) is nothing new to Venkatarame Gowda. In an another case pending enquiry Venkatarame Gowda is supposed to have misappropriated funds in a local private bank and was subsequently dismissed from service. He and his henchmen have occupied a building of the local high school. Despite a court order they have not vacated it.

Going further, the 14 members who constitute the legislature committee are either from the SC/ST or minority communities. Adding legitimacy to all this is the fact that the police officers starting from the rank of superintendent of police to the lowest involved in the investigation of this case are all dalits. D M Sirsikar too is a dalit.

A thorough reading of the 39-page legislature committee report revealed many glaring inconsistencies, false findings and irrelevant recommendations. The sort of coverage given by the legislature committee has gone a long way in covering up the incident. It became clear how a potent complex of state bureaucrats, the police and politicians have long determined the economy of human rights policy in the country.

In considering the refractions of the events in Harati through the prism of legislature committee, it is useful to bear in mind some relevant issues. There have been cases of at least three murders, one rape, one lock-up death, and an attack on the life of a local MLA in the last six months in the district. In all these cases the Congress(I) and Janata Dal were/are involved either as victims or the accused. There has been a balance of power and a bargain struck between each other not to press any case. The superintendent of police, in the case of the assault on the MLA, in his letter to the home ministry quoting the MLA, states that when there was an attempt on his life, the sub-inspector of the concerned police station remained a silent spectator. Concerned sources also state that no action has been taken in all these cases since it is an election year.

The record of retribution is also interesting for, it is based on the views expressed by two individuals Hanumappa and Nagarajaiah on the incident. But then, Kannappa has time and again tried to say that neither was he drunk nor could be afford to get drunk even occasionally. Kannappa himself has consistently declared that he was assaulted and was forced to eat excreta as recorded by the statutory and non-statutory bodies. This has been confirmed by the wound certificate

issued by the medical authority. The medical report given by D M Sirsikar too does not mention consumption of alcohol. In spite of available evidences this concoction by the police—of Kannappa 'being drunk' and 'of using abusive language', against Venkatarame Gowda, has in due course become a master discourse that is relied upon heavily by the legislature committee and others.

The 'drunken state' and the 'use of obscene language' has also become a metaphor so to say in the report. For, public exhibition of hatred, the drunken state, the foul language, towards individuals above oneself in the ladder of hierarchy is a kind of dramatised behaviour that supposedly stands for the 'primitive' and the 'uncultured'. It is this aspect of Kannappa's behaviour that is furthest removed from the supposedly 'restrained', 'civilised' gesture of Venkatarame Gowda, throughout the report. The logic then is far too simple. In his drunken state it is too easy for Kannappa, the primitive, to get out of control; drunkenness and obscene language may imitate counter violence on the part of Venkatarame Gowda who tied him up as he was provoked to indulge in this sort of behaviour. Added to this, in response to the debate on the floor of the house, Byre Gowda, an MLA of the Congress Party said that "the provocation came from Kannappa himself when he, under the influence of alcohol, abused the village leaders in filthy language". This assault on Kannappa then is to be expected from a powerful block political leader of the Congress Party, for he was by Kannappa thus leading to his victimisation.

The most striking feature of the committee's report is perhaps the reduction of the incident to the responses given by the bureaucratic officials of the state and the police without taking due cognisance of the victim's statements. In page three of the report the committee states that its "understanding of the incident is based on the accounts given by the district collector, the police and the important individuals of the place". This source, that we need pursue further, provides very few clues regarding the veracity of the incident. Based on such enquiry it is natural that the committee recommends that care should be taken to maintain public peace in the troubled area and bring it back under the control of law and order. "Therefore, for reasons of social betterment, proper action should be taken against those involved in fabricating this story..." 'Proper action' is a wonderful concept with a virtuous ring that can validate any open-ended use of violence and harassment. The least of which could be a registration of a TADA case on the 'miscreants' who instigated Kannappa.

It will not be out of place here to discuss certain general details regarding the event, Deepotsava, over which there was a dispute. The village god, the dalits claimed, does not now enter their 'keri' (yard) as used to be the tradition earlier. They now demanded that the car carrying the idol should be brought to their keri. The argument of the priest and other elite has been that the idol of Gopalaswamy could be taken anywhere but not that of Sri Ram. A meeting was held on the night of January 28 to discuss not only the route of the procession but also to decide whether they should have the Deepotsava on the Saturday or Sunday.

On January 31, the police went to the village and brought all the witnesses to the forest guest house, an inaccessible place which is 7 km away from Kolar. They were 'interrogated' in the presence of the accused and the other Congress politicians. Statements denying knowledge about the crime were recorded and witnesses were forced to sign on the documents. Meanwhile, the accused who were let off after a few hours of detention brought a statement from about 50 villagers which negates the very occurrence of the incident. Based on these, the police claim that it was discovered to be a false case. They also claim that the accused were not even detained as there was no prima facie evidence. The police officials also said that they were going to take action against those who 'instigated' Kannappa. Ultimately, the police secured a wound certificate from the hospital and conveniently took from it parts which they considered relevant, i e, those parts which speak about abrasions but not about human excreta being forced into Kannappa's mouth. Regarding the injuries on Kannappa's body the police say that "he might have got those abrasions after falling down in a drunken state".

Oppression by Other Means

While on the one hand the legislature committee's version of the event is challenged by the victim, the other witnesses and the official documents, on the other it states that the incident or what it calls a concoction/fabrication was the result of 'political animosity' in Harati. Written with such vagueness it becomes difficult to retrace the exact details. As a consequence neither the event nor the political process in Harati are characterised. Between them the activities of inquiry have almost lost consideration for the predicament of which the event was a symptom. By using blanket phrase of 'political animosity', the committee sought to give the event a cause and the cause a name thereby diverting our attention from substantive issues by creating a sensibility and frame of mind that favours and allows for greater freedom of action by the state. It also becomes obvious that any further investigation would be characterised advantageous to the interests of certain categories.

Reducing the incident to peace and order issue, proceeds by glossing over and even omitting significant areas of people's experiences and activities. As a consequence the reduction of the antecedents of the event is complete and the report reads "Nothing worthy of record and action occurred in Harati". This is placed on record to guide further governmental action. The point is that this exercise has deeper implications. It not only describes the non-occurrence of the incident but also promotes the government as a neutral power and an agency that gathers information without the use of physical force but moral authority through committees. This may even be inferred from a glance of certain other features that recur over and over again in the report. For instance, while talking to the victim one of the committee members is reported to have questioned the reasons for Kannappa not retaliating to the torture and force that he was being subjected to. This seemed to suggest that the members have a 'cramped' understanding of the social structure as well as the nature of politics in India. The massive long-term violence inherent in the social structure is typically disregarded.

This observation has two important implications. One that relates to the structure of the way information was collected by the committee, and the narrative sequence within which it is placed. The second deals with the unfolding of the event.

The legislature enquiry was not conducted in a proper manner. It was not notified/publicised either in Kolar or in the capital city of Bangalore. It sat in an inaccessible place like the forest guest house which is far away from Kolar. To Harati it was a conducted tour by the police who had already hushed up the case. Some of the important evidence was called to Vidhana Soudha in Bangalore. Other witnesses were simply ignored. The legislature committee seems not to have procured important documents like the medical report, forensic report and reports by statutory and non-statutory bodies. Nearly 10 organisations had already brought out reports on the incident. None of which was taken into consideration by the committee.

In addition to this it is surprising to note that no terms of reference were either framed in the assembly debate on the one hand nor in the final report of the legislature committee on the other. This demonstrates that the committee from the beginning did not go into the details with the attention that they deserve, its approach being very casual. Even in the recorded evidence and pursued documents the legislature committee has ignored all inconvenient facts and has arrived at unsubstantiated statements. As a keen observer commented "the report was tailor-made to the satisfaction of the local Congress(I) leaders".

Considering the diachrony of the event the police action, rather inaction, was gross and

misleading, right from the time the incident occurred. The time of the incident is placed somewhere between 8.30 pm and 9 pm on January 28, 1994. In spite of being informed by the duty doctor, the police outpost in the SNR hospital (where Kannappa went for treatment on the night of the mishap) did not take any action whatsoever. It was only later in the day on 29th that the victim went all by himself to Kolar police station complaining of the event. The case was referred to the Kolar rural police station subsequently after which the police served the victim with a questionnaire that was so conveniently framed that it could fetch the required answers. The pointed questions anticipated the required answers which would not lead to registering the crime as it happened. One of the main questions was so ridiculous that it asked whether there were any wounds on the lips. Obviously the answer was expected in the negative and the police concluded that there was no force used to make Kannappa eat the excreta. The Kolar rural police also registered a case under IPC Sections 143, 342, 323, 324 and 149 while the case should have been registered under the SC/ST Atrocities (Prevention) Act 1989. Two days later nearly 50 persons (witnesses) from Harati were brought to forest guest house in Kolar and were made to sign on a document the details of which are not known to the signatories. The assistant superintendent of police Aswatharamaiah said that "the case was withdrawn since there was no prima facie evidence". Since then in the last three months police have been conducting tours for all the official committees giving them their own foregone conclusion of non-occurrence of the incident Even after the acceptance of an assault there is no action from the police. The committee recommended that "although Kannappa was not made to eat stools it cannot be denied that he was assaulted". The police as well as the government seem to have brushed aside these observations keeping in line with the recommendation. "...for reasons of social betterment proper action should be taken against those involved in fabricating this story,...". This recommendation which is irrelevant and falls beyond the scope of the committee. The CoD is yet to come out with the findings but there seems to be little hope in this matter.

In the light of things what makes Kannappa's case typical is that it is about the oppression of a dalit, and a special one as Kannappa is regarded as falling within the purview of the 'development perspective' which is another way of saying that dalits and Kannappa in particular, need to overcome their backwardness. Many of the most familiar features that recur in many incidents of atrocities on dalits is the typecasting of the dalits as being gullible that they do not have a mind of their own, not even common sense. Secondly, the charge of manipulation by the elite groups or forward castes; C Rajendra, one of the 'miscreants' who helped Kannappa, in the case is from the forward caste. Thirdly, the centrality assigned to the 'political order', a phrase that co-opts into itself many things and thereby remains ambiguous.

The case brings to light the hypocrisy of not only the police, political parties but also the government. We also gather that the linkages between the state's interests and power on the one hand, and severe human rights violations on the other is systematic, not accidental. A modest amount of state harassment and steady development of methods of interrogation that inflict enormous pain on the human body and spirit is further evidence that the right of the individual is hardly a primary value in this country.

Any protest that questions the state in this regard has to confront several moral issues arising in protests concerning the violation of human rights. It may be on two levels. If the purpose of the protest is self-aggrandisement, establishing credentials or other self-serving motives, like in the case of National Human Rights Commission and NGOs, it may have at least resulted in marginal gains. Unfortunately neither the opposition parties in Karnataka nor the [illegible] have taken this step. Instead they categorically denied the very occurrence of the event. On the other, if the purpose of protest is to relieve human suffering and defend human rights, more complex considerations arise. One must consider the plausible consequence for victims of oppression. The opposition to violation may be positively harmful. Today people in Harati and nearby villages are not prepared to engage Kannappa for a wage, thus jeopardising his very survival. There is no reparation or aid to the victim in this violence. The only solace is that protest may become a symbol to follow-up in a big way, which can be called a reparation if one wants to. One wonders if forms of protest help alleviate the conditions of those who suffer or would they contribute to reinforcing further the varied ideological foundations for new violence and depredation, if not create new ones. This is a question that all those involved in any form of social protest will have to ask themselves.

BJP: Cow as a Political Symbol

Ernesto Noronha

Though cow as a political symbol lacks the potential to consolidate the Hindu voters, the BJP may continue to use it to enliven the attenuated Ram Janmabhoomi symbol.

IN the assembly elections 1993, the BJP was defeated in three of the four states which it administered. Not able to identify the reasons for its defeat, top party leaders were left confounded on policy matters. While the hard-core within the BJP felt that its failure was due to the dilution of the Hindutva platform, others opposed to this line of thought stressed broadening of the party's appeal by taking up issues having social, economic, and international overtones. This schism got reflected in the response to several policy decisions. Faced with such contradictions, the BJP's show in defiance of the Dunkel Draft turned out to be a farce. From this sort of an outcome on an important issue such as the Dunkel Draft, one can easily discern that the party would cling to the Hindutva plank. The Ram Janmabhoomi symbol, though decrepit, would remain a central symbol, while new symbols may be introduced to rejuvenate the party and keep the communal inferno burning.

From the gamut of symbols available, the BJP seems to believe that the cow can, to some extent, enliven the attenuated Ram Janmabhoomi symbol. This proclivity towards the cow can be seen from two events that have occurred in the recent past. The first was the demonstration against the Al-Kabeer slaughter house where it was alleged by Sadhvi Ritambara that the abattoir was an offshoot of the Gulf conspiracy, designed to rob the country of its cattle wealth, while the VHP leader, Ashok Singhal threatened to dismantle the building brick by brick. Second was the enactment of the Delhi Agricultural Cattle Prevention Bill, 1994. The act made the slaughter of cows, calves and bullocks a non-bailable offence with imprisonment up to 5 years and a fine of Rs 10,000.

Controversy

The issue of cow slaughter has never occupied the centrestage in Hindutva politics but has been intermittently used as a secondary symbol to incite communal violence.

Acknowledging the volatility of the controversy, Gandhi tried to diffuse the tension. He said that the idea of cow protection was close to the Hindu heart and those who did not believe in it could not possibly be Hindus. However, he opposed the formation of cow-protection societies and the passing of legislation prohibiting cow slaughter. The only way out, according to him, was to urge Muslims to refrain from cow slaughter, rather than intimidating them [Khan 1986: 52-62; Chatterji 1984: 66].

The issue continued to plague Indian politics and was debated by the Constituent Assembly [Kashyap 1988: 179-89]. During these confabulations, some of the Hindu members demanded a total ban on cow slaughter as they were of the view that under the pretext of getting rid of infirm cattle even the healthy ones would be butchered. This, according to them, would have an adverse effect on Indian agriculture. They felt that cow slaughter should be made an offence equivalent to untouchability, and 'go-hatya' should be treated as 'brahma-hatya'. Even the Muslim members favoured a total ban on cow slaughter and wanted the issue to be settled once and for all. But the Drafting Committee decided to include cow protection under the Directive Principles of State Policy.

The problem was discussed once again in 1966, when the Shankaracharya of Puri decided to fast unto death if the government did not concede to the demand for a total ban on cow slaughter. Shah (1967: 7-12) saw such a demand as fallacious. In his opinion, democracy did not give the majority a right to act in a manner that would be prejudicial to the rights of other groups. All that could be demanded was that they would not be compelled to eat beef and that cow slaughter be proscribed in the vicinity of a Hindu temple. But since cow slaughter was prescribed in the Brihadaranyaka Upanishad, three of the Vedas and Grihya Sutras on certain occasions, a dilemma emerged for those claiming the support of religion to justify their demand. Further, there was no evidence that the majority of the Hindus themselves wanted cow-slaughter to be banned. For instance, Indian peasants had been selling dry cows to the butchers because of their inability to maintain them.

Apart from these reasons, M M Shah (1967: 44-66), while accepting the usefulness of the cow for the supply of milk, traction power and dung, pointed out that a growing cattle population was creating a heavy burden on land as reflected in the deteriorating quality of cattle. This problem of deteriorating cattle quality was further exacerbated by the shrinking of village common land from where cattle got their feed. Moreover, the need for cattle in agriculture was declining while urbanisation had necessitated an increased production of milk. Consequently, cattle are kept under artificial conditions in urban areas and are fed high-cost imported grass leading to an abnormal cost-price relationship. This has resulted in a decimation of the best breed of milch cattle who, instead of giving satisfactory service for about 10 lactation periods, are used up in a single lactation period. These unwanted animals are then either driven away, sold to the butcher, or left to their luck. In villages, they stray onto fields, frequently get a thrashing, suffer from physical pain and die, or some agent drives them away for slaughter. On the other hand, in cities they roam about eating garbage, nightsoil, rags and stray onto partially protected private and public gardens.

The issue of cow protection, then, is a highly polemical one as secular and religious values are juxtaposed. On the religious side, such has been the supposed reverence for the cow that the Hindu rashtra mandir proposed by Shraddhanand was to be devoted to the three 'mothers'—gaumata, saraswati mata and bhumi mata. Attempts such as this provide a tool in the hands of the communalists to arouse passions since so far as the people are concerned the whole issue is steeped in ambiguity.

Use of Symbols

Today ethnicity poses a challenge to the state and also to the maintenance of harmonious relations within the state. It is often at the root of violent encounters which result in homelessness, looting, death, flight of people, hatred, and widening schisms between communities.

Ethnic conflict has its inception in the evolu-tion of several circumstances like diffusion of the doctrine of self determination, decolonisation, spread of the norms of equality, the value of achievement, the growing heterogeneity of the states, the international system of communication and the emergence of the welfare state. As a result, we have controversies over development plans, educational opportunities, trade union affairs, land policies, business and tax policies, etc, being expressed by communities through the parties they support [Horowitz 1985: 4-12; Glazer and Moynihan 1975: 25].

Ethnic communities are formed by the elites who give subjective and symbolic significance to objective differences between groups which are then translated into a consciousness and desire for group solidarity [Brass 1991: 20-24]. The reality of the community in people's experience is their attachment or commitment to a common body of symbols. Symbols are effective because they are imprecise, i e, most symbols do not have visual or physical expressions but are notions which do not impose a conformity of meaning. Thus, symbols are malleable—they can be made to fit the circumstances of the individual [Cohen 1985: 12-28].

The political significance of symbols is determined by the political elite [Brass 1991]. Symbols that are brought into the political arena are those which the political elite gain from. But the choice and manipulation of symbols is a difficult business, not only

because it can create inter-community disturbances but also because it can be divisive internally. Ethnic demands initially centre around single symbols, but to make the demands more effective there is always a look-out for secondary symbols. This search for additional symbols may lead to internal discord within the community rather than create internal cohesion. Therefore the set of symbols chosen for political mobilisation are as congruent as possible. The basis for identity formation is achieved by intensifying the subjective meaning of the symbol. This makes boundaries sharper and differentiates the group from other groups while possibly enhancing solidarity within the group. Alterations in boundaries depend upon the elites who define them.

In Search of a Secondary Symbol

Ethnic conflict introduces an ethnically based party which derives its support from an identifiable ethnic group and project itself as the sole representative of that group. But to be an ethnic party, the party need not have an exclusive hold on the allegiance of group members—in fact, the manner in which the community's support is distributed decides whether the party is ethnic or not [Horowitz 1985: 291-98]. Symbols like occupational specialisation, residential segregation, habits of endogamy, dietary customs, religious differences, etc, that mark boundaries between groups tend to foster affinity and a sense of common interest which are expressed in party allegiances. The communitarian aspect of ethnicity propels group members towards concentrated party loyalties. Ethnic parties reflect not just affinity but also mutual incompatibility of ethnic claims to power. These parties play the role of interest groups apparently dedicated to the promotion of narrow group claims, thus placing greater strain on the social mechanism for the settlement of group conflict. This attitude on the part of ethnic parties makes the mediation of group interests difficult which explains why ethnic party systems are so conflict-prone (ibid).

It is for this reason the Ram Janmabhoomi-Babri masjid issue is a highly contentious one. The two main parties in conflict, the BJP and AIBMAC, maintain that only they have the right to represent the two ethnic groups, namely, the Hindus and the Muslims. The apprehension of losing the ethnic group support prevents them from scaling down their demands. The BJP seems oblivious of the fact that the community's support is not necessarily distributed in its favour as is evident from the results of the 1993 assembly elections. It still endorses Hindutva and relies on the Ram Janmabhoomi symbol. However, to buttress this central symbol it is on the look out for other secondary symbols.

There is a whole range of secondary symbols which have been used by the BJP like celebration of festivals, wearing saffron bands or caps, introducing the rath-yatras, wielding trishuls, and raising 'jai Shri Ram' slogans, etc. The symbol of cow slaughter is sought to be similarly used even though not all Hindus agree on the issue and differ in opinion.

During the pre-independence period as Hindu demands for cow protection increased, Muslim demands for the right to slaughter the cow intensified and the 'kurbani' festival at which cows were slaughtered grew in importance. These facts may have been important for the BJP now adopting the issue of protecting the cow. However, although the cow is a potential symbol, it does not mean that any Hindutva party which uses it at anytime is bound to succeed. It may succeed only if the government or the Muslims flaunt Hindu sentiments. In this connection, to the BJP's dismay the passing of the recent cattle protection bill did not raise even a semblance of protest from the Muslims. That this sort of apathetic reaction from the Muslims did in no way strengthen the party unity is evident from the dissension within the party.

Having been defeated by the SP-BSP combine in UP, the BJP now sees the need to garner the support of, in addition to the upper caste Hindus, the backward castes to come to power. To achieve this, however, symbols like cow protection can be useful only to a limited extent. Firstly, because as Pandey (1991:3003) states, it cannot be claimed that the depressed classes worship the cow though they worship Hindu gods. Secondly, though the varnashrama dharma regards the worship of the cow as one of the three features common to all Hindus, the backward castes differ from the upper caste Hindus in that they eat beef. Moreover, the rise of the SP-BSP is in itself a challenge to the brahmin-oriented BJP. Thus, the BJP may not gain from blowing the issue of the cow out of proportion as it would underline the differentiations among the Hindus it purportedly represents.

Czech Trade Unions under Pressure

Stephen Steiger

The newly emerging business class in Czechoslovakia is trying hard to push back the trade unions, claiming total freedom for the owners of the enterprises.

WHILE there was a single, 'united' trade union organisation in Czechoslovakia under the old regime—as it was in every communist country—during the years following November 1989 half a dozen new unions have emerged. They are, however, without significance—the biggest counting roughly 153,000 members as against 3.5 million of the CMKOS discussed below. They are, also, mere artificial appendices of some political parties. Attempts at constituting truly independent unions, revolutionary in spirit, out of the strike committees which played an important role in overthrowing the communist regime in 1989 were unsuccessful. Thus the 'old' unions developed into a strong movement now called the Chamber of Czech and Moravian Trade Unions (CMKOS).

The policy of the chamber is modelled on west European unions, also because it became a member of the International Confederation of Free Trade Unions. The chamber's officials profess an 'understanding' of the problems of the present 'period of transformation' of the Czech society, proclaim their support of parliamentary democracy and try to materialise the demands of the members by 'peaceful' means only. The unions' position is weakened, among other things, by constant attacks by the media which are generally hostile to them. And like any other institution that survived the communist regime, they lost much of their authority with their members—in spite of all the changes they had gone through. Needless to say, the newly emerging class of businessmen—rapacious and ruthless, not having yet the 'culture' of the west—is trying hard to push back the unions inside the enterprises, claiming a total 'freedom' for the private owner.*

Neither is the government a friend of the unions. The prime minister Klaus does not miss any opportunity to reject, despise or ridicule the trade unions' 'bosses'. His Thatcherite idea he was repeating again and again was that there was no need for the unions to negotiate on a national level—no need for collective bargaining for whole industrial branches—as agreements within individual enterprises should be sufficient for protecting the employees.

It was under these conditions that the labour code had to be amended and the parliament should have voted on the bill. The three main points of contention which caused a strong trade union protest were the raising of the retirement age by two years for men and four years for women, the women's limit having been lower than the men's; lifting of the ban on work agreements concluded for a limited-time period only; and allowing night work for pregnant women. A petition against the raising of the retirement age was signed by 630,000 people, yet it remained without any effect both on the lawmakers and the government.

The lobbying of the unions in the parliament proved to be ineffective. They called, therefore, for a massive demonstration on Prague's Old Town Square on March 22. Ridiculed by the press, the protest, however, brought together about 40,000 unionists from all over the country—far more than anyone, including the unions' leaders, had expected, and the biggest demonstration since November 1989. To avoid accusations of 'politicalisation'—as the unions claim to be 'non-political', meaning without links to any political party—no one other than unions' representatives was allowed to speak to the gathering.

It was too late, however, for pressuring the deputies: the parliamentarians pretended the matter had been wound up and could not be re-considered seriously any more. The demonstration can thus be held to have been just an important warning for the future. Since a new labour code is in preparation and could be discussed fully before the parliamentary elections due in 1996, the unions' leadership has time enough to prepare the next battle.

Whether this one has been lost entirely cannot be said yet. The CMKOS held its congress on April 8 and 9 and most of its 1,457 delegates, representing 3.5 million members, were rather in a fighting mood. While none of the 'radical' candidates for chairmanship was elected and the new president, Richard Falbr, seems to be rather a middle-of-the-road man, showing their strength by mass mobilisation the trade unions unmistakably put up the sign of possible showdowns should their members feel threatened by government policy once again. This could be seen also by an unexpectedly conciliatory speech with which the prime minister addressed the congress. So perhaps if one battle is lost, the fight will go on without undue pessimism.

Note

* It was the president of the Entrepreneurs' Association who put it bluntly in an interview with the unions' daily: "As long as I am in this position, we won't allow the unions to enter easily into small- and middle-sized businesses where they are not yet represented. I employ 160 people and have 48 apprentices. I do not see any reason why I should have trade unions in my firm"

Trajectory of Hindutva

G Aloysius

Hindutva as an ideology of the vertically constructed communities is the dominant castes' response to the emergence of the Indian version of 'class struggle'. Setting up of two religious monoliths, the Hindu and the Muslim, is intended to cover up and suppress the growth of class-like formations that have threatened the traditional elite's solidarity time and again in modern history.

APPARENTLY, it defies all reason. A community of believers in one religious system, barely 10 per cent of the total population, scattered throughout the length and breadth of the country, fragmented and deeply enmeshed within the different regional cultures and social systems, mostly labourers or petty vendors, owning neither land nor industrial/business resources to any significant extent, admittedly backward in modern education and consequently playing only a marginal role in civil society, in general somewhat slow to take to modern ways of life, the Muslims of India are sought to be set up as a challenge and menace to the overwhelming majority of 'Hindus' constituting more than 80 per cent of the population, in a country which has been the cradle of diverse Hindu religio-cultural traditions for millennia and whose cultural ethos informs and permeates the civic life even in modern India. If two religious monoliths—the Hindus and the Muslims—can at all be set up and compared, the latter comes nowhere near the enormous power and influence that the former wields in multiplicity of ways not only in economy but also in culture and ideology. Then in what ways are the Muslims a threat to the Hindus? Why this anti-Muslim hysteria of the Hindutva combine? Is all the anti-Muslim propaganda of BJP-RSS-VHP-BD, etc, without any basis in reality? If so, how to account for the seemingly widening mass support and the alarming surrender of the upper caste liberal Hindus to this hate-Muslim campaign? If the Muslim community is not the real menace to Hindutva, then what is? Against what is the anger of the aggressive Hindutva, combine directed? What exactly is the trajectory of the Hindutva missile?

Internal Dynamics

Explanations of a community's chauvinism against another can be sought either within itself or without, in the other. When external factors fail to yield adequate explanation, as they do in our case, one has to search the internal dynamics of the Hindu society itself. The parallel to the Nazi Germany is too close to escape comment. The rise of fascism in Germany is better explained by the agenda of internal restructuring of German society that Hitler and company had envisaged rather than any primordial hatred between communities. A chauvinistic posture of a community is more often than not a critique of its own current situation and direction and an indicator of an imperative for reorientation. So is the case of Hindu-Muslim relations in India. The Hindutva combine's hate-Muslim campaign is better explained by its 'real' grievances with the Hindu society itself: the direction it has taken in the wake of modernisation and the kind of restructuring it is likely to undergo.

Any ancient and continuous tradition, such as India's, tends to accumulate in the course of its history several values and organisational patterns representing the aspirations and achievements of the different sections of its population. These values and principles are often inconsistent, contradictory and even antagonistic. However, a sort of *modus vivendi* is developed in its different phases to maintain a minimum of balance and harmony among the opposing forces. In the case of India, the diverse Hindu religio-cultural traditions have inherited two sets of interrelated and contesting value-orientations representing broadly the dominant and the dominated. One is the principle of hierarchy described as varnashrama dharma or brahminical social order, representing the interests of a minority always aspiring to maintain and expand its dominance over the majority in economy and culture. This was opposed by the counter principle of egalitarianism, unevenly representing the interests of the majority struggling to contest, avoid, subvert and sabotage the dominance of the minority. It manifested itself in the multiplicity of non-brahminic and anti-brahminic religious cults, philosophical systems, cultural practices and social movements beginning with the sramanas, the Buddhists and others. However, by and large, in both culture and economy, it was the principle of hierarchy that managed to hold its sway over the masses, though unevenly, over the different regions and time spans, whether under the so-called Hindu rulers, Mogul emperors or the colonial rule. Religious beliefs, concepts and sanctions did and continue to play a crucial role in maintaining this pattern of dominance.

The second set of dichotomy refers to the principle of uniformisation or centralisation and its opposite, pluralism. The subcontinent is characterised not only by the twin contesting principles of organisation, namely, hierarchy and anti-hierarchy but also by unity and diversity as two contending ways of structuring society and polity. At the political level Indian history could be seen as alternating between periods of attempted and partially successful unification and periods of autonomously scattered polities: at the level of culture this has manifested itself in the growth of vernacular languages and regional variations of religious practices in defiance of the centralising and uniforming forces of dominant culture, language and religion.

Obviously, these two sets of principles are closely interlinked; the social forces and interests that stand by the principle of hierarchy are by and large the same that advance the cause of centralisation/uniformisation; while those who plead for a more egalitarian social order also have an interest in having the polity organised pluralistically. For, diversity in the Indian cultural context is a defiance of hierarchical uniformity. The above delineation, needless to point out, is an abstracted picture and an ideal-typical portrayal of reality that is at once dynamic and complex.

Modernity and Democracy

In the wake of modernity and more particularly with the erection of democratic political structure in the sub-continent, the hitherto manageable and containable forces of egalitarianism and pluralism within the Hindu society have received a new fillip. The democratic game of numbers and modern educational avenues to the traditional yearnings for equality and pluralist cultural assertions have upset the long-cherished applecart of age-old order of superordination and subordination. The imperative of having to give the notion of citizenship a semblance of reality has made the state take at least nominal steps to enable the lower caste masses, the marginalised tribals and backward Muslims to enter into the civil society.

However, this is only one side of the matter. Modernity and democracy in India are not an unmixed blessing for the erstwhile underdogs of the society: modernity came in largely as an expansion and elaboration of the role of the traditional elite in the civil society, and political society itself took the form of a pan-Indian state which is but a transformation and consolidation of the earlier scattered socio-

religious dominance A substantial portion of both the civil and political society in India is thus drawn from the social forces which in pre-modern times stood for the twin principles of religious hierarchy and cultural centralisation The major mainstream political formations are but variations within the increasingly consolidating dominant social forces The differences among them pale into insignificance when they are contrasted with those who have been marginalised in the civil and political society

The democratic political structures have opened up newer ways for these political formations to have recourse to different methods of gaining the allegiance of the masses Pressures from below for a more egalitarian and pluralist restructuring of society and polity are being co-opted by the leadership of the different factions among the dominant forces through grant of minimal concessions at the level of policy articulation. These nominal democratic adjustments (often sabotaged in implementation by sections of upper caste leadership), no doubt with a view to self-preservation, nevertheless do have the long-term effect of destabilising the traditional dominant and ruling status of the forces representing hierarchical centralisation

This is perceived as a threat to and as a betrayal of the unwritten and agreed upon code of conduct among the differentiated political formations of the upper caste combine, leading to the view that if democratic compulsions force them to reach out to the masses in a non-traditional way, then democracy itself needs to be repudiated as the 'new-fangled western concept' unsuitable to the Hindu-Indian genius

In this context, the Sangh parivar's Hindutva campaign has to be understood as one formulation—remarkably compact and coherent—of our religio-cultural past as an agenda for present political action leading to a future vision of Indian society Hindutva is both a formulation and a prescription The formulation is characterised by a denial of all that was egalitarian and pluralist in tradition, it is a presentation of a 'semiticised Hinduism' as the 'national tradition' to be preserved and treasured as our unique genius and to be used as an ideological weapon against the so-called western modernity Hindutva has no place for the numerous lower caste Hindu traditions, cults and sects that represent ways of life at variance with the upper caste orthodoxy, it also has no space for the once powerful and prevalent lokayata-carvaka-tantrik-sankya-nastik Hindu traditions so painstakingly unearthed by D P Chattopadyaya Hindutva is an isolation and assemblage of all those elements that in the past stood for oppressive pseudo-sacred hierarchy within the Hindu traditions, detached out of their historical context and dressed up for revival within modern political structure To be sure, the hierarchy of Hindutva is not a simple and mindless revival of the classical varnashrama dharma—which, for that matter, never and nowhere existed in the past either It seeks rather, to maintain and strengthen the upper caste dominance within the caste ideology in modern times

Hindutva, we have suggested, is also a prescription for restructuring our drifting' society and polity As a sectarian reading of Hindu traditions it seeks to lay the ideological foundation for the future society its emphasis on the monolithic hierarchy of tradition seeks to exclude the traditionally excluded masses from the new civil and political society for the same traditional reasons It is a censure of those sections of the upper caste ruling combine who for 'electoral gains seek to tamper with the traditionally accepted order of the society It is one thing to share some of the benefits with the lower caste masses for our own salvation, either here or hereafter but it is totally another to indulge in anything which may have the effect of investing the masses with socio-political rights as part of the emergence of new society For it may have the disastrous and irrevocable consequence for India, i e, the Hindu society, of once and for all doing away with the traditional caste-dominance of ruining national traditions, of obliterating our unique culture —the very Hindu identity itself In contrast to this the Hindutva political mobilisation is a concrete demonstration of as to how the masses can be kept under the traditional caste dominance even in modern times by a careful exclusion of economic and other interest oriented issues and by emphasising culture tradition and religion, etc

Hindutva as cultural uniformisation again advises us not to pay attention to the plurality of our cultural traditions Language as a cultural marker should never be considered It is specifically against considering the variations of our culture as units for devolving political power To put the matter in different words, Hindutva is set against granting rights of self-determination or autonomy for local cultures every demand for more decentralised distribution of power is deemed as secessionism and separatism Since nationalism is nothing but congruence between culture and power the anxiety of the Hindutva combine to define national culture monolithically and hierarchically is understandable though totally unacceptable Nationalism is congruence between culture and power yes, but the congruence requires to be as homogeneous and egalitarian as possible within a modern nation state Hierarchical and monolithic realisation of power within society is a sure cause of disruption and division

While the so-called secular forces accuse the BJP-RSS-VHP BD fraternity of splitting the nation, the latter insists that it is in fact unifying the nation and the secularists are the real splitters For Hindutva the case is simple We are all Hindus Period Nothing more need be said on the matter To differentiate one Hindu from another in terms of caste creed language or region is to divide the Hindu society and to disrupt the Hindu nation There is no Malayali Hindu or Bengali Hindu just as there is no mahar Hindu or bhumihar Hindu Such a formulation is at once deceptively simple and appears to be eminently reasonable It is this very simplicity and seeming reasonableness of the Hindutva formulation and prescription that appeals enormously to the aspirations of the emerging upper caste middle class the backbone of the BJP communal combine

But what this simple' and seemingly 'even handed formulation of monolithic Hindu community tends to cover up is the concrete historical development of the subcontinental past and the competitive nature of present democratic polities The Indian society is an eminent example of uneven development in every sense of the word 'Political nation in the past was constituted here of a very thin stratum of kings and chiefs in matters political and of selective upper caste communities in civil society. Colonialism only helped to aggravate the already existing disparities by polarising the upper caste haves and the mass of lower caste have-nots Neither colonial industrialisation (or deindustrialisation), nor the subsequent planned development succeeded in bringing about any significant change in the traditional society All benefits of modernity, political power employment, education, expansion of business, land resources, etc, tend to percolate not equitably or democratically but by and large through the traditional kinship, caste and regional linkages Social mobility is limited to the upper rungs of the ladder Civil and political society in short seem to be the monopoly of the handful of upper castes, even among these different regions of the country tend to grab unequal share in the economic cake, which refuses to grow in size

However a democratic political structure imposed on this modernised-traditional community operates necessarily as a disruptive force, for the hitherto excluded masses demand entry into the new political nation as equal citizens aspiring to enjoy the full civil and political benefits of democracy. The prescription of the Hindutva—all Hindus and equal Hindus—strikes right at the heart of this struggle for new political emergence of the lower caste, tribal and Muslim masses. Mechanical understanding and application of uniformity and equity for all Hindus is a veiled attempt to prevent the minimal change that is taking place to strengthen the upper caste dominance within the traditional ideological framework and to undercut the upward thrust (however crude and distorted) of the hitherto underprivileged And this is sought to be done under the unexceptionable

principle of Hindu unity. If this disruption appears to be disorderly, uncontrolled, anti-national and even secessionist, it is the dominant upper caste combine that has to blame itself. Instead of gracefully accepting and accelerating and in fact providing the necessary leadership within the changed order of things, the combine sought to subvert the inevitable historical process by having recourse to a semiticised version of Hindu tradition, legacy, etc. Hindutva is the most ruthless formulation of such subversion.

The 'trishul' of Hindutva, then, is raised against the haphazard and tortuous emergence of the lower caste masses into the political nation; it is a warning to the cultural assertions of linguistic communities for a more decentralised and power-sharing federal polity; and it is a censure of those sections of political leadership whose 'appeasement' politics is leading to the 'betrayal' of our age-old traditions. The BJP combine's belligerence against what it terms as 'minorityism', its sniffing of separatism and secessionism in every nook and corner of the country, its demand for the abolition of minority rights, its opposition to all forms of protective discrimination for the marginalised communities, its supreme contempt for the identities of cultural communities/nationalities, its utter disregard for concrete historical developments as manifested in its mantra-like slogan of Hindu-India unity, its uncritical and mindless glorification of our past, etc, are but different expressions of a distorted formulation of our legacy as monolithic hierarchicalism and an undemocratic prescription for the future, peddled in a capsule—Hindutva.

Muslims and Lower Castes

If the trajectory of Hindutva is to be sought within the Hindu communities themselves—their present state, their direction of development, etc, where do the Muslims come into the picture? Why pick on a community that is hardly a threat to anybody, as the enemy of Hindutva? The explanation lies more in the socio-economic and political similarity of the Muslims to the lower caste masses than in their exaggerated religio-cultural dissimilarity to the Hindus in general. The mass of Indian Muslims, drawn as they are largely from the lower castes both in urban and rural areas, is 'dangerously' similar to the latter in their position within the sub-continental social structure in terms of deprivation, backwardness and marginalisation. However at the same time their distinct religious mark stands in the way of effective ideological/cultural domination within 'tradition' by the upper caste elite. The Muslims (and the Christians to a lesser extent) present a hurdle to a pan-Indian traditional-cultural hegemony leading to the strengthening of the upper caste dominance. Ideological exclusion of the Muslims and Christians would enable the Hindutva combine to tame and domesticate the lower caste masses and bring them under the traditional order, through the manipulation of religio-cultural symbols.

Here the issue could be presented as a religious one: threat to religion, etc, while in fact the threat is to the upper caste vested interests, mostly from the egalitarian and pluralistic aspirations of the masses within formal democracy. The Muslim presence as a fellow-marginalised community is a constant reminder to the other similarly deprived communities among the Hindus of the oppressive upper caste stranglehold on the society. It is an open and standing invitation to consolidate a classslike formation of all the segments of the dominated and to engage in a struggle at the socio-economic front. Hindutva as a communalism of vertically constructed communities is the dominant castes' response to the emergence of the Indian version of 'class-struggle'. Setting up of the two religious monoliths, thus, is intended to cover up and suppress the growth of the class-like formations that have threatened the traditional solidarity time and again in modern history. Unfortunately, this elitist strategy had its beginning in the freedom movement itself. Instead of allowing the socio-economic and political interests to dominate the public life, religio-cultural issues were brought to the forefront emphasising the distinct religious identities of the participating communities. Now, the game is defined as one in which the Hindus face the Muslims, while in fact the real contest is between the economic and political interests of the lower caste-tribal-Muslim masses on the one hand and the traditional elite-the upper caste combine on the other. Within this pseudo-game, some are ranged against unity between Hindus and Muslims while others promote unity and harmony. However, both the sides refuse to go beyond this shadow boxing. No wonder, the game suits the handful of elite among the Muslims too.

The mass of Muslim community and the lower castes and tribals are together duped in this false game of religionised politics. The Muslim masses in particular are made a pawn in the game of the Hindu upper caste players, with the silent complicity of some Muslim reactionaries.

The problem of the Hindu vs Muslim in the subcontinent cannot be explained by any primordial hatred between the two communities apparently believing in two different sets of 'gods'. In fact, such monoliths of the Indian Muslim and the Indian Hindu never existed in history at the levels of culture and political economy. They were necessitated for the preservation of the traditional order of superordination and subordination that had begun to melt at the dawn of modernity. The trajectory of Hindutva needs to be grasped accurately if we are to meet and neutralise it effectively. Seeing the problem purely at the level of the Hindus vs Muslims and the multiplying prayer meetings and Sadhbhavana committees may to some extent reduce rioting but the permeation of the society and polity by the poison of Hindutva cannot thus be contained. The principle of peaceful co-existenc so often invoked by the 'democratic-secularists' is indeed a praiseworthy slogan against Hindu-Muslim conflicts; however, it is at best only a prescription against the overt symptoms and at worst an encouragement to the covert and more dangerous forms of Hindutva. Hindutva has to be seen for what it is in substance and faced squarely, primarily at the level of civil society

Decolonising Third World Culture

Malini Bhattacharya

British Romantic Writers and the East: Anxieties of Empire by Nigel Leask; Cambridge University Press, Cambridge, UK, 1993; published in India by Foundation Books, New Delhi, 1993; pp xvi + 266, Rs 150.

FOR those of us who grew up to be students of English Literature in post-1947 India, Eng-lit studies had remained for long a sanitised and conflict-free area within which identification with the perspective of the metropolitan subject had seemed to be possible. British romantic writing, in particular, was regarded by Indian academic tradition as a co-extensive heritage, ours in the same way as it is theirs. It is only during the last couple of decades or so that our otherness in relation to English literature has become an object of study; in fact, since Said's *Orientalism*, Eng-lit students in India too have had to take account of the dimension of imperialist hegemony in the academic space inhabited by them.

Leask's book participates in an exciting project in this particular context, not only from the point of view of Indian students of British Romantic literature, but also for those interested in studying the workings of cultural relationships in a colonial situation. Leask is correctly critical of Said's essentialism and as his title suggests, Leask's emphasis is on the fissures and disjunctions within metropolitan cultural form in historical interaction with colonial experience, of which British Romantic writings is the specific example chosen by him. It is a study of "our imperial history against the grain".

Leask sees the historical context of orientalism in Romantic writings as coinciding with the transition from "mercantilist trade relations" to a "more programmatic intervention in the affairs of African or Asian nations" (p 17), to "participation in the civilising mission of 19th century European culture or the expansionist dependence on colonial markets" (p 22). Elsewhere, this new approach is described as early 19th century "liberal imperialism"; it employed enlightenment attacks on the tyranny and priestcraft of the *ancien regime* to justify the conquest of non-European societies and culture. Its appeal to "diffusion of civility" is, on the other hand, contrasted with a later phenomenon, namely, "the emergent discourse of racial superiority" or the strategy of justifying illiberal colonial policies by "blaming the victims" (p 79). It rather consists in the appropriation of "diverse or primitive cultural forms by a universalised (i e, European) moral imperative ..." (p 23). The history and ideology of western nationalism is riven with contradictions arising from this, and the ambivalences of this approach impart a rich complexity to the Romantic perception of India and the east. In Leask's study, the analysis of this component within Romanticism is further linked up with the Romantic perspective on gender relationships where male sexual desire and the desire for colonial appropriation sometimes turn into each other's analogues.

Leask's book thus seeks to contribute to a 're-politicisation' (also perhaps re-historicisation) of Romanticism where Romanticism is freed from the 'Prison House of Language' into which New Criticism and then Structuralist and post structuralist criticism had placed it; the book derives its vantage-point from the statement of the fact that the "political and ideologieal concerns of poets like Wordsworth, Byron, Shelley and Keats are now read as being constitutive of their poetry rather than merely 'background' material". Leask also perceives a certain 'blindness' on the part of British leftist critical tradition in this respect and he thinks that this is one of the reasons why these 'anxieties' generated within Romanticism by the colonial experience, 'anxieties' the reading of which he considers crucial for "a decolonisation of our culture", have been a neglected area in studies of Romanticism.

Further, while criticising Said's notion of a totalising, monolithic western Orientalism imposing its seamless and unambiguous presence on the Orient, Leask refers to Homi Bhabha's theory of colonial discourse as offering a more 'suggestive model'. In spite of its 'historical weaknesses' he finds the psychoanalytical components in Bhabha's model useful:

> The Indian as 'self-consolidating Other' of European subjecthood occupies a place analogous to Freud's fetish-object in psychoanalytic theory, object of an identification which fluctuates wildly between narcissism and paranoia (p 84).

One way of understanding the 'anxieties' is through such analogues. Also a study of the 'anxieties' of empire, of disjunctions and fissures within Orientalism may be extended to a point where the colonial subject also does not remain the mere passive space within which Orientalism enacts itself, a mere inarticulate recipient of its impositions. Bhabha's thesis admits the potential ability of this subject to deconstruct the colonial space; this is contrasted by Leask with Gayatri Spivak's thesis of the speechless subaltern. Leask's use of the psychoanalytical model is not uniformly appropriate as in the discussion of Shelley's *Alastor* and I think even without Bhabha's somewhat tortuous theory of hybridism, it is possible to offer other models of the self-articulation of the colonial subject, but on the whole, Leask's excursion away from Said towards a more complex historicism offers an interesting break.

Central to Leask's study of the Romantic writers are the chapters on Shelley, the excursus on possible links between some of Shelley's writings and some of the writings of Rammohan Roy being of particular interest to the Indian student. These chapters on Shelley are the most elaborately worked-out parts of Leask's volume, and are flanked by other chapters on Byron and De Quincey. But an intricate fabric of intertextuality is woven with materials from diverse sources like Southey, Lady Morgan, Thomas Medwin and Coleridge. These sources are used to demonstrate the different ways in which ambivalences about the Orient as an object to be appropriated are worked into various Romantic texts. According to Leask, these ambivalences turn up in the writings of conservatives and supporters of the empire like De Quincey as well as in those of radicals like Byron and Shelley

Byron, for instance, has little sympathy for the projects of imperialism. His sharp critique of the European assumption of moral superiority is evident in many of his *Eastern Tales* which are discussed in detail by Leask. Yet his placing of the paradigm of moral superiority in an aristocratic, republican, civic, humanist heritage, in short, a 'Hellenistic' heritage, underscores by contrast 'Asiatic' values of violence, eroticism, fatalism and intoxication which are seeking to swamp these. European imperialism by implication, becomes a deviation and a decline from the pristine purity of Hellenistic values. Even the writings of Byron thus remain dependent on an "orientalist dichotomy between a (fading) European illuminism and Asiatic darkness" (p 61).

Byron is an example of the transition from the position which regards the east as mercantile commodity to be consumed to that which constructs the image of the east as the cultural 'other' which is the object of both 'narcissism and paranoia'. Byron's 'aristocratic radical' ideology and the 'uncanny anticipation' in some of his poetry of the negative, repressive aspects of Enlightenment complicates his response to 'European civility' But De Quincey stands at the other end of the spectrum. 'European civility' under threat from 'oriental' degeneracy turns in the post-Sepoy Mutiny period 'guilefully' into 'violence and

coercion' An example of one of the more apt uses of the psychoanalytical model is found in Leask's deconstruction of one of the "most dramatic episodes of the *Confessions of an Opium Eater*", the account of the sudden visit of a Malay to Dove Cottage while De Quincey was resident there The whole episode has a nightmare quality as presented by De Quincey and he attempts to exorcise the apparition, described by epithets like 'demon' and 'tiger cat' first by reciting from the *Iliad* and then by plying his unwelcome guest with a large portion of opium, the assumption is that the invocation of Hellenism—the 'literature of power' may have the magic effect of reducing the Malay to submission, then the need to dominate is compounded into the need to kill through the proffering of opium Very adroitly, Leask translates De Quincey's paranoia into historical terms, arguing how this paranoia is defined by the 'anxieties of empire', and finding analogies between his 'class hatred' and 'race hatred'—in both there is a perverse identification with the 'other', the identification also signifies how moving in the opposite direction from Byron the conservative pro empire De Quincey arrives close to the same point In his writings

> The ideals of the European nation state and the rights of individuals are forfeited by the imperialist projections and Malthusian fears of an enormously expanding metropolitan population as well as of a 'yellow peril' are subliminally represented as concomitants of global capitalism (p 227)

Imperialist triumph is changed to imperialism fearing itself in fearing the 'other'

Leask rightly assumes that the perception of the curse of power is nowhere of such abiding concern as in Shelley's writings and that as such the theme of 'empire' as the ultimate repository of power cannot be absent there

> It is tempting for admirers of the radical energy of Shelley's poetry and those who are tolerant of the utopian optimism which breaks through the despair of much of his writing, to believe that he was searching for a voice to say albeit late in his short poetic career, what no other contemporary British writer even dreamed of saying Namely that the colonial encounter need not exhaust the possibilities of the meeting of different cultures and that the option might remain however apparently counter factual of imagining communities premised neither upon paranoiac discriminations nor fetishistic identification, the twin pathologies of imperialism (p 169)

In *Prometheus Unbound*, particularly in the working out of the Prometheus-Asia relationship in the dramatic *agon*, Leask discovers the suggestion of such an option which leaves behind the narcissistic appropriation of the other through which orientalist dichotomies are sought to be overcome in *Alastor* or in *Revolt of Islam* The option at the level of the gender paradigm offered by the Prometheus-Asia relationship also opens up by analogy an option in the racial paradigm Leask works out this analogy very forcefully One feels, however, that a too simplistic reading of Shelley's other lyrical drama *Hellas* is indicated in the cursory comment that its metaphoric and narrative energy is sustained by "assertive rationalism (in a qualified form)" Shelley's comments on the European despots in the Preface to *Hellas* is an indication that Mahomet cannot be said to represent oriental imperialism as *opposed* to Hellenic (European) rationalism Also Leask's thesis regarding Shelley's perception of an 'option' in the meeting of cultures would perhaps have been strengthened if there had been some discussion of the critique—rather self-critique—of European Enlightenment which is put in Rousseau's mouth in *Triumph of Life*

For all this however Leask's critique of the general blindness on the part of British Left towards the Empire", reflected in Shelley criticism in the failure to perceive the accommodation which Shelley's radicalism makes with the question of imperialism is very well taken Specially because Shelley was a radical idealist one must look at his representation of the issue far more critically Like the Utilitarians he often makes Hindu culture the emblem of irrational obscurantism but does it hamper his perception of the anomalies of imperialist moral design? Leask's argument that

> India is an oxymoronic figure in his poetry, the site of a revolution which is also a form of imperial domination a contradiction which enforces a particularly tortuous deployment of the metaphors and narrative turns (as well as suppressions) of the orientalist archive (p 79)

has to be taken very seriously Shelley's perception of an option to these dichotomies in *Prometheus Unbound* becomes all the more interesting if we admit the above critique

It is in the context of this development in Shelley's writings that Leask introduces his short chapter on Rammohan Roy's intervention in metropolitan culture in 1817-18 There is no evidence that Shelley actually read Rammohan's articles on Hinduism published in the Unitarian *Monthly Magazine* But the possibility of his having read them is quite strong Leask offers the thesis that Shelley's acquaintance with the thought of the so-called 'reforming Brahmin' may have been a factor in breaking up Shelley's earlier 'politics of assimilation', his faith in the 'civilising mission' of European Enlightenment revolutionising asiatic hierarchies, it may have borne fruit in the

> 'polyphonic texture of Shelley's major work, *Prometheus Unbound* unsettling the norms of both 'orientalist' and assimilationist discourse and permitting the emergence of a new account of the relations between east and west (p 140)

Rammohan's interpretation of Hinduism as a monotheistic creed in its pristine form was according to Leask, distinct from the assumptions of 'orientalist' discourse and at the same time, from the traditionalism of the Brahminical hierarchy of the time His sympathy with Unitarianism did not prevent him from developing independently the model of upanishadic monotheism, while combining with it his early Islamic and sufi training and his later acquaintance with "the radical dissenting Christianity of the European Enlightenment" Leask quite correctly points out that Rammohan is no co-opted spokesman of metropolitan culture, nor a capitulator to Hindu conservatism of his time, but represents a new level of discourse which subverts the demands of colonial power and offers a new basis for a dialogue between different cultures Whether this can be called a 'hybrid theology' after Bhabha is, of course, a separate matter, but Shelley's 'option' in *Prometheus Unbound* consists in the perception that such a discourse is possible

Leask's thesis has special relevance for us in India today when economic and cultural imperialism of a new kind has been setting the agenda of globalisation for the developing countries The contradiction of the situation lies in that this has the effect of indirectly aggravating, and not diminishing, obscurantism and fanaticism For anti-colonial militancy to accommodate obscurantism is not unusual in the history of our national struggle Today however, modernisation, normally associated with rationality, seems itself to breed the irrational in our context Powers of homogenisation are reinforcing the subaltern's loss of linguistic tools This has the effect of encouraging traditions of unreason

The fact of the coincidence of European Enlightenment in the 18th and early 19th centuries with the expansion of colonialism no doubt assumes a situation where 'reason' becomes the instrument of colonial hegemony Within the space of Romantic writings, Leask explores this "complicity between Enlightenment and its historical bedfellow, European imperialism" (p 60) While wholly agreeing with the relevance of such an exploration, I think it is also necessary to ask whether it is not possible to see 'reason' as a multilateral concept and not essentially a by-product of European Enlightenment and imperialist hegemony It may have analogues in different historical situations There may be traditions of uncompromising rationality in different cultures, not necessarily European.

The advent of Rammohan took place at a time when historical circumstances made it possible for him to use the materials of the rationalist traditions in Hindu philosophy (perhaps also Islamic philosophy) as well as his later contacts with European

Enlightenment, in order to strike a new path away from both the 'orientalist' discourse and that Hindu traditionalism which fell in step with the orientalists. This is why it seems to me that Bhabha's thesis of 'hybridism' may not be very helpful in understanding the new perception worked out of indigenous sources that Rammohan represents. Rammohan's anti-'Sati' writings also show that while looking for points of alliance with Enlightenment rationalism and its revolutionary outcome, Rammohan's programme for the reform of Hindu society was based on a logical structure that was genuinely indigenous. At least it develops a relative autonomy *vis-a-vis* the colonist discourse. The rupture that he is able to create in the official perception of women comes from this and not from his adoption of a westernised, elitist position as suggested by some scholars.

Shelley may or may not have read Rammohan's articles on Hinduism, but the radical, utopian-revolutionary aspect of Enlightenment reason which Shelley represented—that which caused the 'anxieties' regarding the dichotomies of imperialist discourse—may well have helped him to construct imaginatively the basis for the kind of dialogic option which Leask finds in *Prometheus*. The fact of Rammohan's model of rationality being there at the same time is a historical corroboration of Shelley's perception. Leask correctly diagnoses the importance of the intervention of imperialist ideology in Romantic literature and considers the study of it essential for 'decolonisation of our culture', but I think he still leaves it for Eng-lit academics in the third world to explore forms of indigenous (and subaltern) rationality which may offer a model for decolonisation of third world cultural forms.

The Food Question

Rajeswari S

The Food Question: Profits versus People? edited by Bernstein, Henry, Ben Crow, Maureen Mackintosh, and Charlotte Martin; Earthscan Publications, London, 1990.

WHEN tools dictate the questions and design the answers, truth—the indigent waif—is left stranded outside the rigid terms of reference. This book invokes socialist analysis to look beyond its historic strengths (of class and power relations), to emerge from the ennui of dogmatic 'givens' and seek answers where nothing is given for sure. In other words, it highlights the felt need for new concepts and analytical tools to explain and provide solutions for problems in a framework of changing institutions and ongoing processes.

The book, a collection of essays on food production, distribution and consumption, highlights the fact that the 'food question' is not the same everywhere. The complexities and contradictions of "actually existing capitalism" are brought out through careful analyses of the institutions of capitalism—markets, gender relations and labour relations. The actors—peasants, merchants, governments, aid agencies, scientists, politicians and bureaucrats—operate within the all-pervasive institutions of capitalism. These institutions are located within specific space-time contexts and the actors' response to food (whether it is a production problem or consumption constraints) is part of—often the very basis of—their survival strategies within these institutions. This essentially imparts significant differences even within apparently homogeneous groups. For instance, peasants, the agrarian petty commodity producers, are not a uniform social category. Bernstein (Chapter 6) argues that peasants are very much part of the complexities and contradictions of capitalism, and thereby, just as stratified. The message is that analyses of peasantry must use the socialist tools without assuming that a particular schema/theory of differentiation applies everywhere, under all circumstances, and produces the same results. There is no one peasant way. Institutional differences (class, gender relations, ecological and exchange systems) within/internal to the peasantry are as integral to exploitation and differentiation, as those external to peasant communities. The question in both theory and practice should be 'which peasants?' Following which, socialist co-operation (as distinct from capitalism and bureaucratic socialism) would be the essential political solution to the problem of impoverisation of the peasantry. However, in advocating socialist co-operation as a valid solution, Bernstein seems to harbour a seemingly innocuous desire for revolution of a particular kind. Revolution and radical change, yes; but hopefully not of one particular kind. If differentiation is complex and highly diverse, a uniform political solution will only add to existing contradictions.

The peasantry or the entire rural populace, for that matter, is a dynamic entity where survival strategies are constantly revised and renewed to overcome market, labour, ecological and gender barriers to food. The institutions that are created/modified/dismantled by women in situations of food crisis are discussed by Whitehead (Chapter 5) and Kabeer (Chapter 12). Gender/sexual politics is the root of the apparent and implicit differences in the way poverty and food crises are created and resisted. Whitehead asks for academics—even those who reiterate the feminisation of poverty—to recognise this sexual politics of poverty. We (men and women) do not live in a world of rational expectations and individual choices; our gender differences obscure the options open to us as human beings. Kabeer's analysis of these options and survival strategies in the context of institutional constraints again makes us question basic concepts of dependency, bargaining power and collective responses or small group behaviour. The difference between Kabeer's rural women and their urban counterparts (Pryer, Chapter 11) is marked by both the alienation and the incapacity to challenge the parameters of oppression, that characterise urbanisation. Yet from the proverbial frying pan they go, almost willingly, to scrounge in the urban wilderness. These migrations from their villages, from institutions of family and kinship are prompted by macro policies dictated by international agencies and implemented by the 'development' state. Mbilinyi (Chapter 10) draws out the ways in which wage labour, especially women, respond to such "structural adjustments of capital and labour in favour of capital". Once again, the book focuses on a sensitive issue even in the most progressive of democracies, viz, decentralisation The fact that support of workers and women is a prerequisite for successful structural adjustments in less developed countries is yet to find a place in the macro-policy maker's intellectually (not socially) informed debate.

While Mbilinyi's focus is on increasing marginalisation of women (through institutions of capital and patriarchy amply aided by the state) in agribusiness complexes, Watts (Chapter 13) delineates the transformation of the peasantry, under 'contract farming'. Adding a new dimension to the mode of production debate, Watts defines contract farming as a form of social organisation. It is the ideal vertical co-ordination of mature capitalism, where agricultural production is directly determined by the "complex and changing profit conditions of global capitalism" (p 149). When the basic farm resource—land—is pledged (by the state, the large capitalist farmer or the peasant) to capital, the entire farm sector is incorporated into the 'big slavery' of corporate production. This, Watts points out, corresponds with flexible specialisation in the manufacturing sector. Both are marked by a deepening division of labour, changes in organisation of production and reintegration of control by capital

(situated outside and truly distant from the location of production).

Contracting of a different sort, more pervasive and highly diversified, characterises the relationship of agricultural producers (large, marginal, small) with capital, through the 'awkward class', the merchants. Harriss (Chapter 8) details the secondary surplus appropriation through the complex and diverse activities of the merchants in agriculture. Merchant capital has achieved, through its blatant profit motives, an integration of the technology and finance components in agricultural production, that state-sponsored agencies have been floundering about for decades. That the state has failed to achieve this is causally related to the mutual interests shared by the state and the merchants. Harriss brings out the opportunism of merchant-capital, effected through sponsoring from time to time, political parties that support their unscrupulous extraction. As in the case of contract farming, merchant capital is also endowed with (what I would call) the greatest achievement of mature capitalism, viz, unaccountability. The days of industrial workers or farm labourers confronting capital directly, regarding wages or food, will soon be part of history. In our times, the industrialist, the financier, and the government are all accountable only to capital and their own profit and power accounts. The complexities of actually existing capitalism increase in direct proportion to the degree of social unaccountability.

The political consequences of this unaccountability of capital once it enters agricultural production are evident in the papers by Patnaik (Chapter 7) and Bartra (Chapter 9). The political crises that third world countries face, following implementation of the capitalist agricultural strategy, reveal the institutional mismatch between existing (land and labour) markets and the ones demanded by capital. The state is taken to task through militant responses of various kinds, by those who have received a few crumbs of the cake and want more (landlords and capitalist farmers), as well as those who have lost their minimum daily bread (peasants and rural labour). One poignant insight from these pieces is that peasant uprisings in the 1980s have been shorn of the direct confrontation with capital, characteristic of earlier times. Now, the state (a tool in the hands of global capitalism) and its bureaucrats, suppress disgruntled peasants, devise price policies to appease large farmers, design doles or simply forget the existence of impoverished rural labour, all amounting to increased accumulation elsewhere. This confusion in locating the 'villain' is nowhere more significant than in the scientific research establishments of capitalism. Buttel (Chapter 14) captures these complexities in biotechnology research and its implications for the third world. Yes, there is immense potential for development using biotechnology; but this has to be preceded by political change and not fore-doomed with the political crises that have marked the green revolution technologies. The international political economy of food that was played between nation states in the 1960s is now enacted among multinational corporations.

Friedmann (Chapter 1) and Crow (Chapter 2) examine the centrality of 'aid' in international food policy, through a historical review of third world food dependence. Food, the capacity to produce it and consume it, is a part of class politics played in the international arena. Friedmann's discussion of the production issue is validated in several other pieces in the book. It is, however, only one piece that explains how urban consumptionism in the west (the British diet for example) is an important determinant of food availability, access to food, and environmental consequences of production strategies followed to meet such excessive consumption patterns (Jenkins, Chapter 15). The way international markets work to increase the imbalances in food production, and reinforce the contradictions of capitalism, is highlighted.

In a discussion informed by recent changes both in the capitalist and socialist worlds, Mackintosh (Chapter 4) calls for a rethinking of the concept of 'markets'. The 'access to food' argument advocated by international agencies (the World Bank) is one that ignores the terms under which people come to markets. Mackintosh concludes that this limited view of the market (as per micro-economic rationale) is the antithesis of food security. We need to reconsider what market liberalisation means: it involves opening new and wider markets for agricultural produce, and constructing narrow, dispersed, and enslaved labour markets. Ultimately what does food, access to it, and the capacity for self-determination mean in the context of this market liberalisation? For those enthused to seek answers, the book provides a reading list (Martin, Chapter 16), true to the kind of open-ended questions that are posed by the articles therein.

It is evident that the authors believe in political solutions to the varied and complex food question. But nowhere is it clear as to how this new political form will be different from existing capitalist democracies and autarchies or the socialist state (of worse repute in recent times than all the crimes of capitalist states put together). The socialist co-operation (though not conceptually clarified) envisaged by Bernstein does demand local decision-making capacity. In this world of increasing globalisation and transnational capital movements, these recommendations for small locally controlled groups/administrations do seem far fetched. More important is to ask whether this is a repetition of past mistakes, perpetrated when we had believed in global idylls. That history reveals patterns, interesting permutations and combinations of institutions and actors in various historical contexts, must suffice to convince us that there cannot (and should not) be an absolute uniform solution.

The book, however, provokes fresh questions and after revealing how existing tools of analyses are inadequate, induces the search for new conceptualisations and theoretical frameworks. There is a parallel here, with the first school of institutional economists, who, while emphasising the relevance of the historical processes in development, called for new terms of reference and/or theoretical frameworks. An example in the context of this book would be Commons' concept of the 'going concern'.* When the family, a corporation, markets, the state, and institutions of the like, are conceptualised as going concerns (defined as a proper synthesis of going plant and going business), the conflicts and solutions sought to them within these institutions can be explained in terms of the three types of transactions (bargaining, managerial, and rationing). Add to this the cognisance that these transactions are kept together by working rules, that these working rules are part of the dialectics of the historical process and are bound to change over time, and we give the economics (the political economy) of food a new set of tools. When working rules are placed in perspective, within the social, anthropological and cultural contexts, the analysis is cleared of the economism—the oft lamented tendency observed in the new institutional economists to reduce all transactions to costs and benefits using the tools of micro-economics—that so taints institutional analysis in recent times.

What this book brings out most significantly is the undeniably strong institutional imperatives that determine who eats what and under what conditions. For all of us trained to seek solutions in demand and supply equations, the articles here are exercises in redefinition. They question the essential assumptions we use to estimate demand and the reality we neglect while quantifying supply. For those of us who see the world polarised in terms of classes and power structures, it teaches us that homogeneous classes and power relations exist only on paper. Most poignant is the message that Bernstein and company deliver: flux is the only certainty.

Role of Economic Planning in India in the 1990s and Beyond

V M Dandekar

The Five-Year Plans have made a distinction between the public and private sectors from the very beginning The plan targets have been prescriptive for the public sector, the Planning Commission acting as a clearing house for many crucial economic decisions taken at different institutional and regional levels, for ensuring inter-sectoral and inter-temporal consistencies by the use of a formal 'economic model'

For the private sector, the plan targets have been only indicative The difference now is that whereas earlier, to enforce indicative targets in the private sector, instruments such as 'taxes and subsidies' and prices licensing and quantitative controls' were deliberately used, beginning with the Eighth Plan, planning will have to operate in a more deregulated environment as far as the private sector is concerned

The important question is how indicative planning for the private sector in a more deregulated environment, with hardly any instruments to enforce the indicated targets, will fit into overall economic planning.

BEFORE we discuss the role of economic planning in the 1990s and beyond, it will be useful to see how the Planning Commission conceives its role in the Eighth Plan (1992-97) It takes note of the "widespread changes which have altered the international social and economic order" and emphasises that it must "respond and adjust to the changes quickly and creatively" Hence, the Eighth Plan is a "Plan for managing the change, for managing the transition from a centrally planned economy to a market-led economy without tearing our socio-cultural fabric" [Planning Commission 1992 Vol I, p i]

Herein lies the rub It is time to realise that 'our socio-cultural fabric' is essentially anti-market There is a populist concern for the small, the poor, the weak, and the backward, the one lagging behind, in short, the one who will not survive the competition in the market place He must be helped and protected This is admirable Unfortunately, this is matched by an irrational animus against the strong, the one who will survive the competition and will grow without social assistance because, in that case, he must be robbing the poor and exploiting the weak Therefore, even if it may not be possible to help the poor and the weak positively and adequately, it is supposed to help the poor and the weak if the strong is constrained and his growth contained This is the policy syndrome called 'Growth with Social Justice' with greater emphasis on Social Justice than on Growth In the process all elements of growth have been crippled and all motivation for standing on one's own made redundant As a result, growth has suffered and, in consequence, also social justice The economy does not produce enough to help those who must be helped If this is indeed 'our socio-cultural fabric' no growth is conceivable without tearing it apart

One of the first tasks of the Planning Commission in the 1990s and beyond should be to educate the people and the politician on this point Economic restructuring requires restructuring of traditional values and behaviour and this should be explicitly included among the goals of future economic planning In deference to those who will consider nothing unless it is done elsewhere and reported by a foreign author, we may note that the First Five-Year Plan (1962-66) of the Republic of Korea, in its goals "included 'modernisation' or the restructuring of the traditional values and behaviour as well as the more usual economic objectives" [Kuznets 1990 659]

This is an educative function and to be able to pursue it as a plan goal, the Planning Commission must become a purely advisory body stripped of all executive authority If this is done, it may be able to pronounce and probe into some of the unspeakable truths of the situation, as in fact the Korean First Five-Year Plan did 'What is perhaps most unusual about this plan is the grim picture of earlier corruption and economic stagnation painted in its first chapter Despite large-scale aid living standards were still very low Arbitrary assessment by capricious tax officials [made] evasion prerequisite for staying in business, many entrepreneurs went into unsavoury league with politicians and bureaucrats, [and] virtually all social evils were connected with greed and maladministration of government officials" [Kuznets 1990]

In short, the economic planning in the 1990s and beyond must be truthful, to the extent,available data and the limitations of macro-economic modelling permit, and must cease to be the election manifesto of the ruling political party Planning Commission as it is presently constituted does not guarantee this "As an institutional safeguard against the Planning Commission operating as a department of the central government, it may be necessary to the commission under the inter-state council envisaged in Article 263 of the Constitution Also the appointment of the members of the Planning Commission should be approved by the council In fact, in all matters relating to centre-state financial and economic relations, the president should be guided by the council and not by the central cabinet" [Gulati and George 1988: 31 32]

Though it is said that the Eighth Plan is a Plan for managing the transition from a centrally planned economy to a market-led economy" [p (i)], elsewhere it is also said:

The centralised planning of the type practised in socialist economies did not exist in India ever In practice, the market has determined allocations in a major segment of the economy ' [1 5 2] But, "So long as public sector investment is a significant proportion of the total investment, planning in relation to the public sector has to be detailed identifying specific projects in the various sectors Besides, the plan of the centre will have to be appropriately linked with the state plans as both the centre and the states have responsibilities in almost all areas All this is analogous to corporate planning' [1 5 11]

We may note that, in the Eighth Plan, the public sector constitutes 70 78 per cent of the total planned' investment (that is, leaving out the household sector) The Planning Commission has a budget (1993-94 BE) of Rs 103 70 crore and directly controls the annual plan expenditure of the central

government amounting to Rs 41,251 crore (1993-94 BE) and indirectly the plan expenditure of the state governments, other than that provided by the central assistance. The total expenditure of the central government amounts to Rs 1,31,323 crore (1993-94 BE) of which Rs 41,251 crore (31.41 per cent) is directly controlled by the Planning Commission. If we consider only the capital expenditure, the total capital expenditure of the central government amounts to Rs 29,484 crore (1993-94 BE) of which Rs 17,066 crore (57 88 per cent) is directly controlled by the Planning Commission. Undoubtedly, this is an awesome authority.

Presumably, to allocate this enormous investment to different sectors/states, the erstwhile 'planning process' will continue. In fact, phrases such as "*forcing* public enterprises to minimise costs and maximise efficiency" [4.5.2] and "the government departments providing these [public] utilities should be *forced* to become by imposing harder budget constraints on them" [4.5.20] are found used in the Eighth Plan document (emphasis added). "For the rest of the system (presumably, private corporate sector), the plan will be indicative outlining the broad directions in which the economy should be growing" [1.5.11].

This is not peculiar to the Eighth Plan. A distinction has been made between the public and private sectors from the very beginning. The plan targets have been prescriptive for the public sector, the Planning Commission acting as a clearing house for many crucial economic decisions taken at different institutional and regional levels, for ensuring inter-sectoral and inter-temporal consistencies by the use of a formal 'economic model'. For the private sector, the plan targets have been only indicative. The difference now is that, earlier, to enforce indicative targets in the private sector, instruments such as 'taxes and subsidies', 'prices, licensing, and other quantitative controls' were deliberately used while, economic planning beginning with the Eighth Plan, so far as the private sector is concerned, will have to operate in a more deregulated environment. The important question to ask is how indicative planning for the private sector in a more deregulated environment, with hardly any instruments to enforce the indicated targets, will fit into overall economic planning.

But before we answer that question, let us first see whether economic planning in the public sector, which includes central and state governments and their undertakings, will be, or rather, should be any different without sacrificing the inter-sectoral and inter-temporal consistencies ensured by a formal economic model. A brief description of the model used in the Seventh Plan may be useful. The following is taken from *A Technical Note on the Seventh Plan of India (1985-90)*, particularly Chapter 1, duly edited and abridged.

Economic Models

Planning in India began with the First Five-Year Plan (1951-56). The planning models in the First and Second Plans were focused mainly on the growth potential determined by the savings potential of the economy and incremental capital/output ratio. They belonged to the Harrod-Domar and Feldman-Mahalanobis family comprising a single sector with no foreign trade. Hence, their demand and supply equations were the same. Since the Third Plan and until the end of the Fifth Plan, the input-output models basically belonging to the Leontief group were used in order to ensure inter-sectoral consistencies between the production targets. The production targets were mainly estimated from the demand side without taking into account the supply constraints except indirectly, for a few specific sectors, by the use of material balances. During the Fourth and the Fifth Plans, the input-output models were articulated by making them 'closed' first by endogenising imports and then consumption in the final demand. The Sixth Plan tried to integrate the Harrod-Domar and the input-output approaches in a demand-supply frame. An investment planning model was developed and integrated with the input-output system and the demand-supply balances were checked over time, not only in the commodity and services market but also in the markets dealing with primary inputs like labour and capital and other important non-renewable resources [Planning Commission 1980: 1].

In the Seventh Plan, the basic model remained the same as in the Sixth Plan. It comprised a 'core model' consisting of (i) a macro-economic model, (ii) an input-output model, (iii) an investment model and seven major 'sub-models', namely, agriculture, industry, consumption, poverty, export and import, financial resources, and demography and employment. The core model and all the sub-models have two distinctive parts: (i) the model structure is presented in the form of a system of equations which involve a number of parameters and which postulate certain interrelationships between all major variables, like consumption, investment, export, import, and different policy instruments of the government; and (ii) appropriate estimation procedures to estimate the various parameters either based on observed behaviour or technology.

To begin with, estimates are made of the requirements of the economy (demand) in the light of certain basic objectives of growth, equity and self-reliance as recommended by the National Development Council (NDC). This is done in the 'core model'. The demand is decomposed into four main groups: (i) consumption, both public and private, (ii) investment again separated into public and private, (iii) exports, and (iv) intermediate goods.

The macro-economic model consists of a number of national income and expenditure identities and this, in combination with input-output model, determines investment in the terminal year endogenously. Given a target rate of growth and base year GDP, saving and consumption decisions of public and private sectors and certain other exogenous variables, macro-economic model determines resources available for investment. A crucial link between the macro-economic model and the input-output model is provided by the value of total imports. Iterative process between macro-economic model and input-output model ends when the value of investible resources in the terminal year converge to the same value in successive runs.

Investment model is then started. Investment model derives investment requirements at broad aggregate sector levels and converts investment by destination into that by origin. In case of a mismatch between available resources and required resources for investment, the latter is adjusted by moderating on the post-terminal rates of growth. At the end of a run of investment model, investment by type of assets (construction, machinery and equipment, and changes in stock) is obtained and this in turn is fed into the input-output model for a re-run. Iterative process for the core model concludes when investment level and its asset composition remains the same in successive iterations.

Sub-models are constructed to go into details of certain phenomena that are complementary to the core input-output model. Some of these sub-models are percussive to the main model, like demographic projections and assumptions of saving behaviour of different institutions in the economy. Certain other sub-models are recursive like the employment. By its very specification, the core model excludes certain variables like land and water, aggregates certain commodity production activities like in petroleum sectors; assumes some variables as given exogenously, for example export vector. Sub-models are constructed to pay attention which is technically necessary but which is not at present integrated in the main input-output model.

The model system runs on the basis of a set of lagged endogenous variables, a set of relevant parameters and selected exogenous

variables including the policy variables. The basic set of parameters in the core models are the input-output coefficient matrix and the capital output ratios. Besides, there are other parameters relating to different sub-models. They refer mainly to consumption propensities/expenditure elasticities, all demography related parameters, functions relating to costs and use of natural resources, transport coefficients, etc. The basic parameters of the I/O table are based on 1973-74 I/O (input-output) table of 115 sectors prepared by the Central Statistical Organisation (CSO) duly updated and revised. Import use coefficients are estimated by using information obtained from the CSO regarding destination and imports and allocations in proportion to total input use flows among identified destination sectors. Capital coefficient matrix and incremental capital output ratios (ICORs) are based on econometric estimation on the past data on capital output ratios worked out by the working group constituted for the purpose [Planning Commission 1985: 1-5].

This is an imposing mathematical structure and its purpose is to ensure inter-sectoral consistency between production targets set by the plan. Without wanting to derogate the pursuit of the mathematical model builders to represent the economy as a mathematical system consisting of a large number of interrelated equations, we should note the following: (i) Inevitably, it is a highly aggregated model. The I/O table for 1973-74 originally prepared by the CSO conceived the economy as having 115 sectors, that is, 115 groups of commodities and services. Later, this was aggregated into only 60 sectors. The CSO has updated this table and published a 60-sector I/O table for 1978-79 and also for 1983-84. Presumably, for purposes of the Seventh Plan, the Planning Commission has used the last mentioned table but has further aggregated it into only 50 groups. For instance, one of the 50 sectors consists of sugarcane (including gur), groundnut, rubber, coconut, tobacco, and crops other than paddy (including rice milling), wheat (including flour milling), jowar, bajra, maize, gram, pulses (milled and unmilled), jute, cotton, tea, and coffee. Another sector consists of edible oils (hydrogenated or otherwise), tea and coffee processing, miscellaneous food products, beverages, and tobacco products. Yet another sector consists of heavy chemicals (organic and inorganic), paints, varnishes, and lacquers, drugs and medicines, soaps, cosmetics, glycerine, and other chemicals (excluding synthetic fibres and resins). Yet another sector consists of tractors and other agricultural implements, industrial machinery, machine tools, office computing and accounting machinery and other non-electrical machinery. With such aggregated sectors, I/O coefficients have little meaning and inter-sectoral consistency allows more of wheat compensated by less of tea; or more of hydrogenated oil compensated by less of processed tea; or more of tractors compensated by fewer machine tools.

Moreover, the data base of the Indian economy is probably adequate for estimating the Gross Domestic Product but quite unsatisfactory for estimation of I/O coefficients, capital coefficient or incremental capital/output ratios. Further, many parameters of the mathematical models are pure guesswork or political pronouncements called policy variables. Finally, with indicative planning for the private sector, as it is envisaged in the Eighth Plan, in a more deregulated environment with hardly any instruments to enforce the indicated targets, one must ask what is the meaning of inter-sectoral consistency which the plan model is supposed to ensure.

For those not familiar with the mathematics of modelling and the statistical or factual foundations of these models, planning models are a great mystery and that is their strength. Commenting on planning models S P Gupta, who was himself an Advisor and Head of the Perspective Planning Division of the Planning Commission during the Sixth and Seventh Plan formulations, says: "Like most economic models, the planning models are also abstractions of reality. They try to capture the objectives and efforts needed in planned development. Their usefulness lies in helping to understand the complex economic linkages in alternative policy decisions, and to help planners devise ways and means to lead the economy in the desired direction. However, it is well appreciated that there are many behavioural relations and institutional factors which are difficult to capture in a rigorous formal model frame, although they may be very important to the country's development. Therefore, any result based on formal modelling should be used with necessary caution. But a total absence of any formal model structure may result in inconsistencies and lopsided priorities in allocating resources. Indeed, formalised modelling is found to be an effective disciplining device in the exercise of choice of policy-makers and users" [Gupta 1989:6]. Indeed, the plan model is the device which the Planning Commission has used to enforce discipline on the central and state governments, their ministries, departments, and undertakings.

In trying to enforce discipline on the ministries, departments, and undertakings of the central government, as Gupta says, much of the work done in the Planning Commission, in effect, is a duplication of the jobs of different ministries [Gupta 1989:71]. In trying to discipline the state governments, the Planning Commission is straining the federal structure envisaged in the Constitution. A major task of the Planning Commission in the 1990s and beyond should be how to (i) avoid duplication of work which legitimately belongs to different ministries and (ii) recognise autonomy of the state governments. To appreciate the nature of the problem, it will be useful to recapitulate, even if briefly, the planning process and how it moves through the labyrinth of the Planning Commission.

The following account is taken from S P Gupta (1989) (in particular, its Chapter 2). Gupta, as mentioned above, was himself an Advisor and Head of the Perspective Planning Division of the Planning Commission during the Sixth and Seventh Plan formulations. Of course, the material is suitably abridged and edited.

Planning Commission

The Planning Commission was set up in March 1950 by a resolution of the government of India and has now grown into a large body with the prime minister as the chairman, the deputy chairman, several full-time members and the ministers of Human Resource Development, of Finance and of Agriculture as ex-officio members. Besides, there is a minister of state for planning. The day-to-day work of the commission is looked after by the deputy chairman. The commission has a collective responsibility but, for convenience, each member has charge of a group of subjects. In short, it is a parallel mini cabinet under the prime minister. It has a large secretariat consisting of a number of divisions (presently as many as 30 in number) which may be classified into four types: (i) general divisions concerned with certain aspects of the entire economy, (ii) subject divisions concerned with specific subjects, (iii) service divisions concerned with administration, accounts, and general services, and (iv) area divisions called the State Plan Divisions, where state plans are formulated and monitored. By end of March 1993, it had a total staff strength of 5,315. It is one of the very few government agencies which carry a large research staff, consisting of experts from all fields of development.

Nevertheless, Gupta mentions, the composition of the staff is some what weighted towards civil servants and bureaucrats, and much of its work, in effect, is a duplication of the jobs of different ministries [Gupta 1989:71]. This may be so. But, we may mention that the distinction between a research worker in a governmental establishment and a bureaucrat is rather thin. Experience shows that when a senior scientist is appointed the secretary of a ministry, or

the director of a research institute, or the vice-chancellor of a university, it takes about two years for him to become an administrator, and probably another two years to become a politician. What is true of a senior scientist is also true of a junior scientist, a junior scientist becomes a junior administrator and a junior politician, almost proportionately. To correct this, even if partially, the Planning Commission, in future, must shed much of its administrative authority and strive to become an expert advisory body.

Planning Process

The first step in plan making is to prepare an 'Approach Paper' on the basis of estimates of likely long-term changes in the major parameters of growth as well as during the Five-Year Plan period. These are based on the experience of the past, projected requirements in future and likely availability of resources for the next plan worked out by various working groups consisting of officials in the Planning Commission, central ministries, other institutions, state governments, and experts in the field. As many as 126 working groups were set up in connection with the Seventh Plan.

While initiating work on the 'Approach' at the national level, state governments are also advised to take preliminary steps for formulating their 'Approach' and set up working groups wherever considered necessary. After the Approach Paper is approved by the National Development Council, the Planning Commission addresses the central ministries and state governments to formulate detailed proposals of their plans. When the states submit their plan proposals, these are discussed in different working groups.

In the case of central plan, the concerned division prepares a status paper taking into account the recommendations of the concerned working groups, proposals of the relevant ministries, and its own assessment. The status paper constitutes the basis of discussion between the Planning Commission and the secretary of the concerned central ministry/department. In the light of the discussions with the ministries and the anticipated total resources for the central plan, the commission takes a veiw on the development programme of each ministry/department. The recommendations of all the working groups on the proposals of a state are considered by the concerned State Plan Adviser. This report forms the basis of discussions between the Planning Commission and the state governments for finalising the plan for each state and its targets of additional resources mobilisation.

The Project Appraisal Division makes an appraisal of central government projects

costing more than Rs 2 crore before they are considered by the Public Investment Board or the Expenditure Finance Committee (EFC). In appraising a project, the division examines the need for the project, its linkages with the plan, technical and organisational aspects as well as the economic and financial viability of the project. The division also appraises revised cost estimates of major central projects when these exceed 20 per cent of the sanctioned cost.

The projects, forwarded for appraisal, are broadly divided into three categories: (i) industrial and non-basic sectors; (ii) infrastructure projects and (iii) social projects. The appraisal approach differs among them.

For the public sector projects covering non-basic sectors, like watches, drugs, certain chemicals, etc, the criteria for accepting or rejecting a project is mainly based on an assumed economic rate of return of 12 per cent per annum, and whether their production is within the targeted demand for the product. The anticipated output is valued at c i f prices to determine the 'make it or buy it' decision.

For the infrastructure projects, the proposed investment project is recommended if it is found to be the least cost option available to meet the targeted demand. In practice, however, often the alternatives are hardly available for appraisal. These projects are not constrained in their selection by the economic rates of return criteria of 12 per cent per annum but on the basis of social rates of return which are difficult to estimate both on conceptual and data considerations. Hence, in effect, they are mostly calculated in qualitative terms. The social projects aim mainly to benefit the poorest of the poor and reduce income disparity. The appraisal report in these cases makes an attempt to investigate their benefits in qualitative terms.

The weakest element in the present practice of appraisal of projects is that usually one project at a time is submitted for appraisal and selection so that it is not possible to make a choice from alternative projects. This creates a special problem in the core sector. The rejection of a proposed project becomes often impossible since it might mean a shortage in the infrastructure facilities stipulated in the plan and preparation of another proposal from the secretariat takes time. Moreover, quite often, the proposed location of many projects cannot be changed because it is decided mainly on political grounds. Often, the initial project reports are so bad and based on such scanty data that, while passing through the various bureaucratic stages of approval, they have to be reported back time and again causing delay in approval [Gupta 1989:73].

The identification and presentation of the projects are prerogatives of implementing ministries and public sector undertakings. The appraisal is done mainly by the Planning Commission and emerges as recommendations. However, the final approval comes from the Public Investment Board (PIB). The PIB is the committee of secretaries entrusted with the investment decisions of public sector projects involving an investment outlay of above Rs 5 crore. Investments worth Rs 1 to 5 crore go to the EFC. The cabinet generally accepts the recommendations and implementations as per approved project

The states, as also the several working groups, prepare their plans within broad benchmarks supplied by the Planning Commission which are mostly in broad aggregates and usually at very general levels so that they can be differently interpreted by various working groups. As a result, the working groups often prepare their reports on the basis of mutually inconsistent assumptions Moreover, the working groups' reports usually come so late that many of their views cannot even get incorporated into the plan [Gupta 1989: 72]

At this stage, the working groups, both in the centre and the states, make their recommendations primarily on the basis of needs and feasibility of programmes and projects, since they do not have a clear idea of the resources likely to be available for development programmes in their respective area. The total of the outlays recommended by them, therefore, often turn out to be far in excess of what can be accommodated within the total estimated resources. As a result, it becomes necessary to prune the recommendations of the working groups in the process of finalising the central and state plans.

The estimates of resources of the centre for the plan are prepared by the Working Group on Financial Resources, which includes, *inter alia*, the representatives of the Planning Commission, the ministry of finance and the Reserve Bank of India. At the same time, the Financial Resources Division of the Planning Commission requests the state governments to furnish estimates of their resources for the plan. Detailed discussions are held with each state government to prepare mutually agreed upon estimates of resources. The Five-Year Plan, after incorporating the central and state plans, together with their financing schemes, as finally approved by the Planning Commission, is considered by the Union Cabinet. After its approval, the plan is placed before the National Development Council and, after the council approves, it is placed before the two houses of parliament.

The procedures for the formulation of annual plans is broadly the same as that adopted for the Five-Year Plan. However, in the case of the centre, there is a slight variation. First, the estimates of central resources are called for from the ministry of finance and finalised in consultation with them since there is no resources working group on central resources for the annual plan. Secondly, discussions with central ministries are held on the plan proposals sent as drafts by them. All meetings for this purpose are convened by the secretary, Planning Commission, with the secretary of the concerned ministry/department. Further, since the annual plan is formulated within the framework of a Five-Year Plan, the discussions with outside organisations and experts are on a limited scale.

The annual plan exercises have been increasingly confined almost exclusively to resource-availability, and the adjustments in investment allocations between sectors are being done mostly on a *pro rata* basis which has no scientific base; rather it comes out as a 'compromise' formula between the contending recipients [Gupta 1989: 72]. Worse still, physical targets are often not revised alongside. The mid-term appraisal comes some time in the third year of the plan. A correction to 'plan priorities' presented in this appraisal document has sometimes proved to be very academic as it comes too late in the plan period. In any case, most of the public sector enterprises attach very little importance to post-evaluation studies.

To sum up, the annual plan is the operative part of planning and no wonder that its main concern is almost exclusively the budgetary resources of the government. The investment allocations made to different ministries coming out of an elaborate mathematical model ensuring inter-sectoral consistencies are adjusted to fit into the budgetary resources on a *pro rata* basis which has no scientific base. As a consequence, the annual plan is a 'compromise' formula between the several contending recipients; in other words, it is a political solution. The Planning Commission yields because, unlike the ministries, it is not directly involved in the day-to-day implementation of programmes and projects and the underlying policy-making. In short, in spite of all the accumulated knowledge and information which, presumably, enables it to take a long- and medium-term development perspective, it does not know enough of how the government functions from day-to-day.

In contrast, the several ministries may not have knowledge and information sufficient to take a long- or medium-term development perspective of the entire economy but they have enough administrative and technical expertise to project a five-year programme of works and projects with well-defined priorities and sequencing so that, given the annual budget allocations, they can more easily and more meaningfully present a programme for a given year and update the programme for the next five years.

Planning in the 1990s and beyond, so far as the ministries/departments of the central government is concerned, should largely consist of putting together their updated programmes for the next five years in the manner of a rolling plan. To this should be appended (a) the annual plans after they are incorporated in the annual budget, (b) a transparent review of the implementation of the previous annual plan; the review should be prepared by the concerned ministry and the Planning Commission should discuss it with the concerned ministry to ensure that shortcomings and delays are not glossed over, and (c) a note on the bureaucratic practices and procedures which delay plan implementation with specific suggestions, in consultation with the concerned parties, as to how these may be revised. Administrative Reforms Commissions in the past have remained more or less confined to the surface of the administration and have rarely looked into the bottom. This cannot be done by Administrative Reforms Commissions appointed once in a way. This has to be a continuing process and should be a major responsibility of the Planning Commission in the future.

Regarding the public sector undertakings, the Eighth Plan document says: "For the public sector to perform the role expected of it in the 90s, the issue of loss-making public sector enterprises will have to be squarely addressed. A policy of the government meeting cash losses of so many enterprises for all times to come is just not sustainable. ...Efforts must be made to restructure and revitalise public sector units which are potentially viable through infusion of new technology, rationalisation of labour, and even infusion of resources for diversification or modernisation. Equally, patently unviable PSUs may have to be closed down with suitable social safety net mechanism, including retrenching and redeployment, being devised to protect the interests of workers. It should be recognised that in many cases the very rationale of the public sector entering certain industrial areas needs to be re-examined...and the restructuring of the public sector would essentially entail vacating such areas for private sector initiatives in coming years" [1.4.40].

Needless to say this will be a long process and essentially a political one. The Planning Commission can play a useful role by bringing together the representatives of finance, industry, and labour ministries and of the management and the labour union(s) of the concerned PSU, and initiating a meaningful dialogue which recognises that there are two sides to any vexed and delicate question. In the present case, while the legitimate interests of the workers have to be protected, the workers must also agree to share the responsibility by way of owning a share of the equity capital and proportionate participation in the management. Ideally, the present public sector should become the workers' sector owned and managed by the workers. But, it will have to be dealt with case by case. A few successful negotiations will set the principles and pace of restructuring. This should be an important item on the agenda of the Planning Commission in the 1990s and beyond.

State Plans

Let us next see the manner in which the Planning Commission in trying to impose a national plan on the state governments is straining the federal structure envisaged in the Constitution. As mentioned above, the recommendations of all the working groups on the proposals of a state are considered by the concerned State Plan Adviser and his report forms the basis of discussions between the Planning Commission and the state governments for finalising the plan for each state and its targets of additional resources mobilisation. It is simply preposterous that a single officer in the Planning Commission should sit in judgment on the plan proposals coming from the government of a state. It is surprising how this has been swallowed for four decades. The reasons are historical.

The historical circumstances in which the country became independent and accepted the strategy of planned economic development have helped to emphasise the unitary rather than the federal elements in the Constitution. Independent India inherited war-shattered and food-short economy and wartime food and price controls stressed the need for central action. Foreign exchange and import control, distribution of scarce commodities such as coal, steel, and cement, and regulation of inter-state trade and commerce necessary for price control could all be entrusted only to the union government. There prevailed wide popular support for the concept of planned development so that not just the Planning Commission, but also the National Development Council and even the states supported enthusiastically an ambitious plan. Planned development requires licensing of industries to conserve capital resources, to prevent their diversion into wasteful channels, and to ensure industrial dispersal into all regions; only the union government could administer the requisite licensing system. Socialist emphasis on the public sector increased immensely the powers of the union. Though the public sector was not confined to the union, the bigger industrial corporations and even more so the financial institutions such as the Life Insurance Corporation, the commercial and the development banks all came to be owned and controlled by the union government. The concept that certain minimum needs of the people must be satisfied all over the

country gave the union government a mandate to lay down national targets, including those in the state sector such as irrigation, roads, foodgrains production, education, public health, etc, and to freely exercise union authority to achieve them. Occasional voicing of concern for the states' autonomy within the federal constitution was branded as parochial.

Finance Commission and Planning Commission

We may note that, in regard to centre-state relations, two important institutions, the Finance Commission and the Planning Commission, have tended to work in opposite directions. The Finance Commission strives to ensure the financial autonomy of the states so that they may fulfil satisfactorily the functions assigned to them by the Constitution. On the other hand, the Planning Commission strives to bring the states into a national plan frame and leaves them hardly any sphere which they may call their own so that the country may presumably move, without deviation or distortion, along the path of planned development of the Planning Commission's conception.

The setting up of the Planning Commission to look after plan finance and recommend plan assistance for the states necessitated a demarcation between non-plan and plan expenditure and it became customary to limit the terms of reference of the Finance Commissions to non-plan expenditure only. To see the effect of this change, we should note the difference between the Finance Commissions' recommendations of devolution to states through tax-sharing and grants and the plan assistance to states, through grants and loans, which the Planning Commissions recommend. The tax sharing is regarded as matter of right and can leave the states with surpluses which they are free to spend. The grants under Article 275 are limited to non-plan deficits. They can be conditional but generally are not. In a sense, the deficit states receive these grants also as a matter of constitutional right.

In contrast, prior to the Fourth Plan, plan assistance was based on states' needs and ability to implement the plan as judged by the Planning Commission. Moreover, it was mainly schematic in nature and came in the form of a string of conditional grants. With the Fourth Plan, the Gadgil formula made the plan assistance more general and freed the states of excessive control. In 1979, the Planning Commission adopted the formula for a substantial part of plan assistance and utilised the discretionary assistance put at its disposal for the benefit of the poorer states. Since 1980, the Gadgil formula has been modified abolishing the weightage of 10 per cent given to continuing irrigation and power schemes and doubling the weightage for backwardness as measured by the per capita income from 10 to 20 per cent. As of now, a certain proportion of the total funds available for transfer is earmarked for assistance to the special category states and the balance is distributed among the other states as follows: 60 per cent in proportion to population, 20 per cent in proportion to backwardness as measured by per capita income, 10 per cent in proportion to the tax effort and 10 per cent in relation to the special problems. This is fair and equitable.

But the whole plan assistance depends on the approval by the Planning Commission of the state's plan as a whole. The assistance would be reduced in proportion to the shortage in the agreed plan outlay. On some items, the assistance is tied so that a shortfall in expenditure on these items would invite a cut in earmarked assistance. Besides, there is a detailed technical appraisal of all irrigation, power, and agricultural schemes costing more than Rs 5 crore and a proforma examination of all schemes costing Rs 1 crore to Rs 5 crore by the Central Water Commission, the Central Electricity Authority, and the Indian Council of Agricultural Research.

Moreover, since the non-plan surplus is regarded as an item of plan resources, the Finance Commission's tax-sharing also comes indirectly within the purview of the Planning Commission. The Finance Commission strives to leave as many states as possible with a surplus in their non-plan revenue accounts hoping that the states may then be free to use this surplus to finance planned development of their own conception. But the states have no freedom to use their non-plan revenue surpluses any more than they have to use the plan assistance from the union. The two are put together along with any additional financial resources a state may be expected to raise and the expenditure of it all is subject to an overall plan approved by the Planning Commission. That is it. A state may have a non-plan surplus. It may be willing to raise additional resources. It will accept plan assistance of which a larger part is in the form of loans which must be repaid. But it has no freedom, no autonomy in deciding the pattern of its development. Such are the compulsions of a national plan.

The states in India have widely different resources and are at widely different stages of development as measured by their per capita incomes. For instance, in 1989-90, the per capita net domestic product was Rs 2,122 in Bihar and Rs 7,081 in Punjab [CSO 1991: Statement 5]. For all one knows, the gap is widening. The Planning Commission prepares a national plan with sectoral allocations broken up into central plan and states' plans. The states fall in line because the centre holds the financial strings. But it is unlikely that the plans for different states are the most appropriate for their resources and the stages of their development. This is no reflection on the competence of the Planning Commission. The country is just too big and varied and no one need be offended by that fact. After 40 years of planning experience, one should now adopt a more modest posture and allow the states greater freedom and autonomy in the planning of their development.

Need for More Autonomy to States

There are two parts to this. First, what should be the size and content of the central plan. Second, given the overall size of its plan determined by its own resources and the assistance that the centre will provide, how much freedom a state should have in deciding its sectoral allocation and in fixing the details of plan schemes in each sector. In the original estimates of the Seventh Five Year-Plan (1985-90), the total public sector plan outlay was estimated at Rs 1,80,000 (at 1984-85 prices) crore. Of this, the centre's plan (including UTs) outlay amounted to Rs 99,302 crore which is 55 17 per cent of the total. According to the latest estimates given in the document of the Eighth Plan [Statement 5.1], the total public sector outlay is estimated at Rs 1,78,377 crore. Of this, the centre's plan outlay amounts to Rs 1,08,746 crore which is 60.96 per cent. In the Eighth Five-Year Plan (1992-97) of the total public sector outlay of Rs 4,34,100 crore (at 1991-92 prices), the centre's outlay (including UTs) is Rs 2,54,115 crore which is 58.54 per cent [Table 3.6]. Judging by the past experience, the centre's share, in actuals, may go above 60 per cent. Evidently, the centre's share in the public sector plan outlay is increasing.

Clearly, there are sectors of which the development must be largely with the centre as for instance large industry, rail and air transport, communications, and science and technology. Equally clearly, there are sectors the development of which must largely rest with the states keeping the centre's role to the minimal. These are agriculture, rural development, special area programmes, village and small industries, and many of the social services such as education and health. These sectors are essentially decentralised and the process of their development has to be decentralised. Nevertheless, in the Eighth Five-Year Plan (1992-97), the centre's share in the public sector outlay in agriculture is 23.38 per cent; in rural development 70.33 per cent; in village and small industry 39.96 per cent; in general education 42.86 per cent; in medical and public health, 29.94 per cent, and in family

welfare 100 00 per cent If the ground for this is a presumption that the centre has greater competence even in these areas it is simply not true any more if it ever was

Moreover, a large part of the states plan in these sectors is in the form of central and centrally sponsored schemes The result is that the ministries and departments of the union government, with their enthusiasm and capacity to get more funds from their government, and the corresponding departments of the state government with equal enthusiasm but less ability to get funds from the government, have in collusion managed to unduly increase the number of such schemes The issue was examined in the Fourth Plan and out of about 125 such schemes 36 were transferred to the states The Study Team on Financial Administration (Report, 1967 Vol I, pp 86 87) of the Administrative Reforms Commission felt that many more could be so transferred In 1969, the National Development Council laid down guidelines for such schemes and put a ceiling of one seventh to one sixth say about 15 per cent, of the total block plan assistance to the states But all this is ignored The central and centrally sponsored schemes continue to dominate the plan assistance to the states In 1992 93 according to revised budget estimates, the central and centrally sponsored schemes accounted for 30 95 per cent of the total plan assistance to the states amounting to Rs 22 589 12 crore If we confine attention to plan grants only, the central and centrally sponsored schemes accounted for 45 02 per cent of the total plan grants amounting to Rs 15 155 73 crore According to the budget estimates for 1993-94, the central and centrally sponsored schemes account for 35 49 per cent in total plan assistance and 48 91 per cent in plan grants

The second part of the question is given the size of their plans, to what extent should the sectoral allocation be left to the states This is a complex matter and there is both a theory and a practice about it In theory all sectors of an economy are inter linked in the purely material sense that the inputs needed by one sector are supplied directly or indirectly by the other sectors Hence, the sectoral allocations of the plan have to be internally consistent so that the inputs needed are in fact produced This is briefly the justification why the Planning Commission prepares a national plan with internally consistent sectoral allocations and then divides it up between the centre and the several states

In practice, the government in India has little control over a large part of the economy Even in the matter of investment of the total estimated investment during the Seventh Five-Year Plan period (1985-90) amounting to Rs 3 48 148 crore investment worth only Rs 1 80 000 crore which is 51 70 per cent of the total is planned to be made in the public sector The remaining is expected to occur in the private corporate and household sectors The planning by the Planning Commission for these sectors is at best indicative The investment in these sectors will in general be in response to market expectations rather than the expectations of the Planning Commission Even in the public sector the plan succeeds at best in respect of investment but not so much in respect of output There is besides the variable weather which affects agriculture producing one third of the national product Under the circumstance what the Planning Commission can at best do is to promptly respond to what actually happens in the economy and annually revise and adjust its own sectoral plan allocations so as to regain and retain the sectoral balance in the economy Presumably this is what the Planning Commission does in its annual plan exercises We have already commented upon the nature of this sectoral inter consistency and particularly the manner in which it gets distorted in the annual plans

If such is the theory and the practice of planning no great harm will come if the Planning Commission relaxes a little and allows some freedom and discretion to the states in the matter of their development This means that the Planning Commission should function and perform in essentially the same manner as does the Finance Commission namely allocating the plan resources on an agreed basis leaving the states with complete freedom to utilise them according to their judgment The main difference between the two would be that while the Finance Commission dissolves itself after making its recommendations the Planning Commission may sit through the Five Year Plan period (not necessarily with the same membership) and review the situation year by year In fact it can be a rolling plan for the next five years so that the states may know the plan allocations they are likely to get over the next five years, adjusted year by year according to the budgetary resources, but keeping a five-year perspective all along

In fact, one should seriously consider the possibility of merging the Finance Commission and the Planning Commission into a single body charged with the allocation of resources from the centre to the states in the manner described above "The existence of numerous agencies in the field of resource transfers has in our view prevented an integrated look at the totality of resources and the needs of the states and the centre It is necessary to entrust this task to a single, permanent agency This body should have the responsibility of allocating not only budgetary resources but also institutional financial resources As the pace of development determines largely the resource raising capacity and expenditure needs of the states ideally it is the Planning Commission which should be entrusted with the task of resource transfers Were the Planning Commission to be so constituted as to inspire the confidence of the states, the task of sharing of resources between the centre and the states and as between states could safely be entrusted to such a body" [Gulati and George 1988 31-32]

Finally planning for the private sector will have to be indicative as in the past but now in a more deregulated environment with hardly any instruments to enforce the indicated targets The indicative plan will inform the private sector of the perspective of the Planning Commission, as an agency of the Inter-State Council, of the sectoral public investment contemplated by the centre and state governments and of the medium-term forecast for the different sectors, including the external sector of the economy If the private sector finds such indicative plan useful in making its investment decisions it will buy it To be sure, there will be private agencies providing the same service to the private sector and the Planning Commission will have to prove that it has better information and greater economic expertise for the purpose That will give the Planning Commission an opportunity to become acquainted with competitive environment in which the private sector is expected to function

[This paper was prepared at the instance of the Planning Commission and was circulated for a meeting of senior economists held on May 23 1994]

Assessing Gorbachev

Bhupinder Brar

To look for precise categories in Gorbachev's case is to altogether miss the point about his paradox: He felt pushed towards the reforms he considered absolutely essential, but he also felt pulled back by the tradition from which he had come and to which, in a profound sense, he still belonged. While only he had to grapple with his predicament, his dilemmas were not of his own making. They were typical products of the hegemonic Bolshevik universe, particularly its organisational ethos. While he was a partially emancipated member of this universe, his politics was rooted in the peculiar condition in which the hegemony of Bolshevism had survived in the Soviet system.

What proved to be his undoing was the manner in which he related to the Soviet reality: He did not understand that he was making ideological appeals to a society that had been, in essence, completely de-ideologised over the decades.

HAVING occupied the centrestage of world politics until late 1991, Mikhail Gorbachev has more recently been out of public sight. As a result, he seems to have slipped from public mind as well. There is no doubt, nonetheless, that when the rubble and the dust of the last few years has settled, and when the future historians sit down to take stock, he will, for better or worse, prove to have been the most consequential man in the last decades of the 20th century.

This paper attempts to assess the legacy of this man who evoked emotions stronger than intellect. A subject of astonishment, speculation, adulation, and dismay to different people at different points of time, he remained—and remains—objectively the least understood. Only the enigma of yesteryears has been replaced today by apathy. This paper proceeds by taking the position that serious students of politics can ill-afford to share this apathy, for much more than as an interesting individual, Gorbachev should hold our interest for both what he reflected and what he represented.

The paper may be roughly divided into two parts. The first half—comprising Sections II, III and IV—examines how the mainstream commentators have tended to assess Gorbachev. This is inevitably intermeshed with the mainstream narrative of the Soviet collapse. Section II describes how Gorbachev's political and strategic initiatives had initially defied all popular notions about the Soviet foreign policy. In the main, this policy was explained in terms that are best referred to as powercentric, and on which I will shortly make some brief comments. Powercentric explanations had not only remained well-entrenched even after Stalin's death, they had become even more widespread during the Brezhnev period, particularly after the Soviet intervention in Afghanistan. Section III notes how the west had, after the initial bewilderment, attempted to accommodate Gorbachev's initiatives within a slightly modified version of powercentrism. This version reconstructed the recent Soviet past in a manner that bore no relation with how the west had been earlier analysing these years, nor did it tally with how the west had been predicting Soviet future. Section IV shows how, in any case, the evidence required for validating the reconstructed version was singularly lacking.

Taken together, these three sections aim to demonstrate two things: (1) that the 'inevitability thesis' in which the explanations are now usually wrapped is woven of an extremely thin and weak yarn, and (2) that since this is so, those assessments of Gorbachev's policies in the last years which are based on this inevitability thesis are equally off the mark.

The second half of this paper—consisting of Sections V to VIII—contains my assessment. This is attempted in terms of the paradoxes created by what I call Gorbachev's 'partial emancipation' from the 'hegemonic Bolshevik values'. As we proceed, I will have some occasion to describe what I mean by these two expressions.

In order to arrive at my assessment, I begin Section V of this paper by trying to glean Gorbachev's ultimate socio-political ideal from his writings and statements. Section VI shows how his vision was convoluted by his partial emancipation from the hegemonic Bolshevik context. Sections VII and VIII discuss the consequences of this convolution. I argue that Gorbachev's vantage point was twice-removed from the Soviet reality, and that there was a double mismatch between him, the CPSU and the Soviet people.

II

Let me begin by commenting on what I mean by powercentrism and why I find it important to understand this for our present purpose.

As an explanatory device, powercentrism is not only about the role of power in politics but also about the concept of politics itself. Powercentrism goes much farther than the legitimate claim that power is an important—often the most important—instrument of attaining political goals and that exercise of power is therefore found both useful and desirable, or even necessary and unavoidable, by political actors. Power for powercentrism is the very goal of politics, not sometimes, not usually, but always; not one among several goals of politics either, but the only goal which rules supreme and in relation to which other goals of politics are secondary, derivative and subservient. History and economy, society and culture, ideologies and personalities, do not determine political objectives; they merely influence the manner in which power—the sole objective—is pursued.

Probably the most telling feature of powercentrism is its understanding of the role ideology plays in politics. It treats ideology as an instrument of power—of persuasion, persecution and subjugation; of discrimination and exploitation; of deception and rationalisation; and, above all, of disguising power motives under illusions.

Powercentrism explained Soviet foreign policy as a product made entirely of ambitions for power. Although the Soviet state apparently sought varied goals—economic, ideological and strategic—all of these could easily be traced back to questions of influence, leadership, power and hegemony in which these goals were basically rooted.

In the west, an entire powercentrist imagery was woven around the belief that the Sino-Soviet split had in no way undermined Soviet ambition or determination to emerge triumphant in the superpower rivalry. Even though China on its southern flank had become a source of threat rather than support, and even though as a consequence Moscow now had to divert considerable portion of its military capability to that border, the Soviet aspiration to gain global supremacy remained unaffected. Hoping that somehow a wedge would one day divide the American bloc as well, it resolutely continued to build its nuclear arsenal even if it costs its much poorer economy heavily, and maintained an extremely large conventional military force. Thanks to this imagery, distrust continued to dominate western attitude towards Moscow despite occasional intervals marked by *detente*

Moscow's invasion of non-aligned Afghanistan, and its tenacity in staying there

despite heavy losses, appeared as the final proof of Soviet hegemonism For some, this invasion started a second cold war, to others, it was continuation of the one and only cold war that had started under Stalin

It was at this point that Gorbachev assumed leadership in the USSR Soon thereafter, he took a series of foreign policy initiatives which unsettled the entire powercentric imagery He began to pursue his goals of arms limitation with such energy and fervour, announcing unilateral cuts and urging the US to produce matching gestures, that it threw western statesmen and strategists into awkward and defensive responses Within less than a month of assuming office, Gorbachev declared in April 1985 an immediate six-month freeze on the deployment of missiles in Europe, to expire in November only if the NATO deployment of Cruise and Pershing II missiles was not withdrawn likewise In August the USSR instituted a unilateral five-month moratorium on nuclear testing While he was on an official visit to France, Gorbachev proposed in October a 50 per cent cut in Soviet and US strategic nuclear weapons, coupled with a ban on space strike weapons, opening of direct talks with France and the UK on their nuclear forces, and continued moratorium on deployment of Soviet intermediate range weapons in Europe

A second set of initiatives began in March 1987 when Soviet proposals on intermediate range nuclear forces were formally tabled at Geneva arms control talks In July, Gorbachev expressed support for a global 'zero option' on the elimination of intermediate nuclear force from Asia and Europe This finally resulted in the signing of the INF treaty to eliminate land-based weapons falling in this category In March 1988 Gorbachev proposed a freeze on the level of naval forces in the Mediterranean In September he announced a Peace Plan under which the USSR would stop using its naval bases in Cam Ranh bay in exchange for US agreement to eliminate its bases in the Philippines In December he announced in the UN a unilateral decision to reduce Soviet conventional forces including withdrawal of 50,000 troops from eastern Europe It resulted finally in the signing of the CFE treaty

Gorbachev's initiatives in the field of arms reduction were both significant and dramatic But still more important was his larger political agenda, of which arms reduction was after all only one part In its essence the agenda consisted of dismantling bipolar barriers, dousing the smouldering cold war, and building what he somewhat picturesquely called a "common home", based not on any doctrinaire position but on "principles common to humanity in the modern world" [1] He visualised a world "in which everyone would preserve their own philosophic, political and ideological views", but a world that would nevertheless be "more secure and reliable"[2] because it would function on the principle that "ideological differences should not be transferred to the sphere of interstate relations, nor should foreign policy be subordinated to them" [3] Gorbachev believed that a non-ideological "supra-system coalition" among states belonging to different social systems could be created [4] He thought that "the USSR and the US could come up with large joint programmes, pooling resources and scientific and intellectual potentials in order to solve the most diverse problems for the benefit of humankind" [5] He pleaded for dialogue, open diplomacy, cessation of neo-colonial interventions and proxy wars, removal of regional conflicts and tensions, and total elimination of nuclear war as an option

Gorbachev's global agenda looked nothing short of utopian But he seemed to have decided to lead the campaign for its realisation by personal example It is in this context that he started successively disengaging Soviet Union from all those political and military tangles which had appeared in the cold war period only the most natural trappings of a superpower Let us see how

The superpower political involvements of Soviet Union had spanned the whole planet But somewhat schematically they could be viewed as four concentric circles The outermost circle consisted of national bourgeois', 'progressive', 'anti-imperialist' regimes spread all over the third world, following what was described as independent 'non-capitalist' path of development Soviet Union gave them economic aid as well as weapons, supported them in international forums, and entered into treaties of friendship with them The third circle consisted of 'socialistically inclined' regimes which had progressed beyond the 'national-bourgeois' stage but were still not quite communist Some examples of this type were Ethiopia, Angola, Mozambique and Nicaragua The second innermost circle consisted of those communist regimes which lay outside the Warsaw Pact Naturally, Soviet commitment to these regimes was much deeper Soviet support to such a regime in North Korea had contributed to the beginning of the cold war, support to North Vietnam had further intensified it, and attempts to install nuclear weapons in Cuba had brought the world to the brink of a nuclear war The first circle contained besides the Soviet Union itself the Warsaw Pact countries Its integrity was paramount in Soviet mind Internal dissent in this circle could make Soviet tanks roll into any east European country under the Brezhnev doctrine Its defence against the west had most Soviet nuclear and conventional strength concentrated on this flank

Soviet Union under Gorbachev withdrew from each of these circles, and each such withdrawal befuddled powercentrists So unbelievable did indeed look what Gorbachev was doing that it became quite fashionable in the west to warn one another against a lethal 'hidden agenda" which the wily Soviet leader carried well covered under his personal charm and polish The frightening scenario thus painted was that one day a credulous West would walk into a trap laid by Moscow

III

Remembering those days, it is both amazing and amusing to see how fashionable it has now become to dismiss Gorbachev's very same moves as no more than the outer symptoms of a collapsing Soviet state Not a few analysts now actually argue that Gorbachev was not so much a visionary as a shrewd politician who was acutely aware that his country was going under with a sinking economy, and made some desperate, last-ditch attempts to shed as much load as he could manage in order to stay afloat It is argued that his attempts to end the cold war were made not from a position of strength but severe weakness, that his arms limitation initiatives were a product of the pressing need to reduce the debilitating drainage of economic resources in maintaining strategic parity with the west that disengagement from political and ideological commitments were meant to stop another source of drainage, namely, the massive assistance which Moscow had always felt obliged to provide to its poor, backward and dependent allies in the third world, and that finally, even CMEA and Warsaw Treaty commitments appeared too heavy to bear

Once it is viewed in this manner, Soviet behaviour under Gorbachev presents no problem to the powercentrists It can now be argued that Soviets' motives had not undergone any metamorphosis, that they were still based on considerations and calculations of power, but these calculations themselves required that ambitions be curtailed Gorbachev was no pacifist, then, but simply a strategist manoeuvring a tactical retreat

Such portrayal may appear quite persuasive But in order to be really so, two things will have to be established by the powercentrists First, they will have to show that the condition of Soviet economy was in the early 80s itself so bad that all the drastic foreign policy steps which Gorbachev took had become mandatory It will not do to argue that since the condition became calamitous by the late 80s, it could not have been much better five years earlier There are many who refuse to buy such deductions They argue, quite persuasively, that the final ruination was caused not by reasons inherent in the economy but by Gorbachev's 'ill-conceived' decentralisation plans, that it was the medicine which killed the patient

Secondly, the powercentrists will have to demonstrate that not only was the actual condition of the Soviet economy bad, Gorbachev also perceived it to be so, that he recognised it to be actually so grave that he felt obliged to take steps which, had the condition been not so bad, he would not have taken.

I devote the remaining part of this section and the whole of the next to show that the powercentrists fulfil neither of these conditions. In order to achieve my aim, I rely on contemporary accounts, preferring them to retrospective reconstructions. In the present case, that contemporary period is the mid-80s, when Gorbachev was about to become the general secretary of the CPSU. Secondly, I choose to quote as often as possible from articles which appeared in the *Problems of Communism*, an anti-communist journal published by the US government which subscribes completely to the powercentrist premises about communist behaviour. The idea behind this choice is to ensure that I am not accused of relying on pro-Soviet sources to make my point.

In this context, we will need to keep in mind that two fairly indisputable facts about the Soviet economy were known to the western scholarship well before the mid-80s: one, that it had slackened substantially during the Brezhnev era and, two, that this sluggishness was caused, above all, by structural restraints and imbalances. Important for us are not these facts, however, but the kind of forecasts which the western scholars in possession of these facts were making.

Were They Pointing to an Impending Catastrophe?

Rather than attempting an answer to this question myself, I will simply refer to two respectable representative examples from western scholarship. The first of these pertains to an American symposium held in October 1980 to take stock of Soviet economic trends and project them up to the year 2000. The projections put the average annual rate of growth at 2.26 per cent in a low growth rate scenario.[6] The second forecast, made in February 1984 by a professional econometric forecasting agency, and quoted quite approvingly in an article in the *Problems of Communism*, came pretty much to the same conclusion.[7] The fact that the two exercises predicted the same growth rate indicates that the western scholars did not find throughout the early 80s any particular reason to revise their original estimates. The impression very much was that the Soviet economy will, in the words of the second report, "continue muddling through" despite its problems.

Since the latter report was published only a year before Gorbachev took over as the general secretary of the CPSU, it can, I believe, be taken as a fairly accurate picture of the kind of economy which Gorbachev was seen by the west as having inherited. More revealing from my point of view is the fact that while western scholars were convinced that reforms were required in the Soviet economy, they were not at all persuaded that Soviet leaders found the situation bad enough to panic and turn eager to undertake the required reforms. Typical of the powercentrist refrain of that time was as follows:

> ... I see no clear-cut solution for the Soviet Union's economic problems. Although many analysts stress the need to decentralise the decision-making in the Soviet economy, I would take the unpopular stand of suggesting that this will be of no avail unless production units are made responsible for the national resources that they utilise. Such a decentralisation of economic responsibility is inseparable from the fundamental problem of property ownership. At this point in time, I cannot imagine that Soviet leaders will initiate the risky business of revising property rights in their economic system.[8]

Another scholar sounded equally unsure in his assessment of the course that the Soviet leadership would take under the circumstances:

> We do not know which of the agonising choices the Soviet leaders will make at this crucial juncture, whether they will decide on the introduction of reforms that may weaken the party rule, on a stupid muddling through by failing to adjust to changing conditions, or on a return to the once efficacious Stalinist order that could now lead to resistance within the party as well as among the people.[9]

If the contemporary western estimates about the economy and polity of Soviet Union were noteworthy in that neither economic collapse nor dramatic political changes were being predicted, the reading of the Soviet future course in international relations was all the more noteworthy for our present purpose. Here, the scholarship was far from unsure of itself and put forth its viewpoint in the most unambiguous terms. They visualised no change whatsoever. Soviet Union was the same old, power-hungry, aggressive Evil Empire. Wrote Richard Pipes in 1984:

> As concerns the [Soviet] objective, no one familiar with the communist theory can entertain much doubt. It is the elimination, worldwide, of private ownership of the means of production and the 'bourgeois' order which rests upon it, and its replacement with what Lenin called a worldwide republic of Soviets.[10]

Harry Gelman, another commentator, refused to be "misled" by relative quiet on the Soviet front, for he believed in "the virtual certainty of continued intense competition between the two superpowers in the world arena..." He argued:

> The fact that no major Soviet geopolitical advances have in fact occurred since 1980 appears to stem much more from happenstance than from any fundamental change in Soviet attitudes. This relative quiescence could change without notice at any time. Although the Soviet leaders feel somewhat burdened by their war in Afghanistan, and are also likely to be somewhat reluctant to assume major new economic burdens for the sake of new third world clients, there is still no evidence, and little reason to believe, that they are willing to accept status-quo in the overall division of political forces in the world, which still greatly favours the United States. Moscow therefore continues to await major new geopolitical opportunities, and is unlikely to be willing to sacrifice such an opening—should one present itself at acceptable risk—for the sake of bilateral agreements with the United States.[11]

But probably the best example is of Zbigniew Brzezinski who published in 1986 a book advising American foreign policy-makers on how they should conduct the US-Soviet relations. It is clear that at the time of writing the book he had no idea of the forthcoming *perestroika* in Soviet foreign policy, let alone any idea of the eventual Soviet collapse. He therefore let the manuscript go as it was. The central position of this book is that the "American-Soviet contest is not temporary aberration but an historical rivalry that will long endure".[12] He insisted on the "historical depth of the American-Soviet antagonism, the degree of conflict between the geopolitical interests of the two powers, and the intensity of the regional turbulence that by itself generates conflicting superpower responses".[13] According to him, Moscow had a long-term plan to evict the US from its positions on the eastern, western and southern frontiers of the massive Eurasian territory. He argued that if the USSR captured "the peripheries of this landmass...it will not only control the vast human, economic, and military resources but also gain access to the geostrategic approaches to the western hemisphere—the Atlantic and the Pacific oceans."[14] By the end of the century if things go bad for central America, "it is quite possible that a fourth central strategic front may be opening up on the Rio Grande".[15]

Not knowing that in a short time Gorbachev would himself do some of these things quite voluntarily, Brzezinski suggested, by way of a subversive game plan, that the US make an effort to "transform the essence of eastern Europe's relationship with Moscow without necessarily disrupting the formal framework".[16] The plan also included mobilising within Soviet Union "the forces for genuine political participation, for greater national co-determination

for the dispersal of central power, and for the termination of heavy-handed central domination that breeds expansionist impulse".[17] One may remark in a lighter vein that going by Brzezinski's game plan, Gorbachev emerged as an American agent, sabotaging the Soviet system to perfection in accordance with his master's plans. But more seriously, when one has someone like Brzezinski suggesting a game plan like this, one should be able to conclude that even those Americans who were closest to the seat of power and were privy to the most confidential information had no idea whatsoever that there was on cards in Moscow a dramatic departure from its traditional global role.

IV

I believe I have built in the above section a sufficiently strong case that, going by the contemporary accounts given by powercentrists themselves, the Soviet economy appeared in the mid-80s far from reaching the catastrophic situation it reached five years later. Powercentrist defence, I suppose, will be something like this: they will still insist that the situation in the mid-80s was indeed grave enough to warrant and actually cause the surgical remedial steps which Gorbachev took, but they will concede that they were themselves at that time ill-informed and did not know the gravity of the situation. They will then want us not to take their accounts of that time as the basis for explanation of the Soviet collapse.

The apparent advantage of such a position would be that the powercentrists will be able to salvage their explanation of Soviet political withdrawal and subsequent collapse. As a price they will have to disown their contemporary analyses of the mid-80s. If one is to go by their earlier record under similar circumstances, powercentrists should not be too disinclined to pay this price. After all, they took a similar step at the time of the Sino-Soviet split.[18]

Unfortunately for them, however, the advantage will be rather short-lived, because having crossed one hurdle, they will quickly run into another. I had argued in the course of the previous section that the powercentrists will have to show not merely that the situation was bad but also that Gorbachev actually perceived it to be bad enough to warrant the taking of steps which he would not have taken were the situation not so bad. Powercentrists will sadly discover that ...hev would not come to their rescue. ...lished in 1987, his book *Perestroika* ...ined nothing to show that Gorbachev ... the economic situation bad enough to ... the panic button. Not that he tried, in ... manner of his predecessors, to fudge the ...ion. He admitted rather candidly that ... loss of economic momentum had been "particularly clear" since the 1970s. He conceded that "In the last 15 years the growth rates had declined by more than a half and by the beginning of the 80s had fallen to a level close to economic stagnation".[19] He shared with us the information that "An unbiased and honest approach led us to the only logical conclusion that the country was verging on crisis".[20]

However, the knowledge that there was a crisis did not daunt him. He was more than confident that his reforms would not only put the economy on the path of recovery but also lead to spectacular results. Let me quote him in some detail:

> And if we criticise ourselves the way nobody has ever criticised us, west, east or anywhere else, that is only because we are strong and we do not fear for our future. We will withstand these criticisms; the people and the party will withstand them. But when our reforms produce the expected results, then the critics of socialism will also have to undergo a 'perestroika'.
>
> ***
>
> We will resolve the issues which we honestly discuss, and we will achieve the goals we have charted The disposition of our people should also be taken into account If they have been stung to the quick, so to speak, if their patriotic feelings have been involved, they will spare no effort to achieve their ends and will work wonders in doing so The Soviet Union is a vast country rich in minerals and skilled manpower, and with great scientific resources So do not rush to toss us on the 'ash-heap of history'; the idea only makes Soviet people smile.
>
> ***
>
> The success of perestroika will show that socialism is not only capable of coping with the historic task of reaching the heights of scientific and technological progress but that it can handle it with a maximum of social and moral efficiency, by the methods of democracy, for the people and thanks to their own efforts, intellect, skills, talents, conscience and awareness of their responsibility to the people.
>
> ***
>
> The success of perestroika will be the final argument in the historical dispute as to which system is more consistent with the interests of the people. the Soviet Union will gain a new attractiveness and will become the living embodiment of the advantages that are inherent in the socialist system.[21]

Read now, this long passage fills one with a sad irony. These lines appear to overflow with astounding naivete. Here was somebody with the head in the clouds and the feet completely off the ground. But that is not the point. The point is that this man— call him what you will—was in full control of Soviet foreign policy. And since we are concerned here primarily with explaining the policy he was in control of, we must go by his perceptions and not by what many of us might think the reality was. He was in no panic and in no desperate load-shedding exercise. He wrote:

> ..does the west want to overstrain the Soviet Union economically by accelerating the arms race in order to frustrate the formidable work we have started and force the leadership to allocate more and more resources for unproductive purposes, for armaments? Does the whole idea really boil down to forcing the Soviet Union to focus entirely on domestic problems, thus allowing the west to dominate the rest of the world?
>
> But there is another aspect to the issue Those hoping to overstrain the Soviet Union seem to be presumptuous about their own economic well-being. No matter how rich the US is, it too can ill afford to throw away a third of a trillion dollars a year on armaments. A rise in the arms spending triggers increases in the budget deficit. The US today borrows two-thirds of what it spends on arms. The US federal debt is, in fact, the Pentagon debt...[22]

So much for the argument that Gorbachev had mooted all his arms reductions proposals to get out of the costly arms race because he found Soviet economy could no longer bear this burden!

But there is another, altogether different, interpretation possible of the passages quoted above, and that is one interpretation which the powercentrists should like. The interpretation is that these passages, and indeed the whole book from which they are taken, are partly false bravado of a despondent and desperate man; partly morale-boosting, confidence-building pep-talk for the benefit of harassed Soviet citizens; and partly sheer salesmanship undertaken on behalf of his country and aimed at the western readership. It is not merely hyperbolic, it is also totally contrary to facts. Gorbachev knew one thing and said another. His foreign policy actions did follow from his actual beliefs but his actual beliefs were never articulated in this book.

This interesting but rather inventive interpretation does not hold water. We have fairly good circumstantial evidence that neither Gorbachev nor his book was a sham, and that he did seriously hold the views he expressed in the book.

This evidence lies in the extremely confident nature of his responses to ideological and programmatic differences which existed in the top echelons of Soviet leadership around the time when the book was written. Let us consider some examples. In the year 1987 both prime minister Nikolai Ryzhkov as well as Yegor Ligachev, the CPSU ideology chief and number two man in the politbureau, had articulated differences with Gorbachev. Representing oldgaurd conservative opinion, they advised Gorbachev in early June to go slow and not introduce the new management system until

1991. The intervening years were needed in their opinion to "prepare for the transition to radical reforms." Ligachev was also reported to have warned that attempts were being made to misuse 'openness' for disseminating views "hostile to the interests of the working people." He said that 'class enemy' nourished hopes of exploiting Gorbachev's economic and social renewal programmes to weaken the influence of Marxism-Leninism.[23] Gorbachev's response to all this was in the form of his declaration that the first results of his reforms had been encouraging. Only the conservative bureaucratic methods of economic managers were in sharp contrast with the growing activity of the masses.[24] At the end of the same month Gorbachev pushed through the Supreme Soviet the new management laws.[25] His attitude was not any less firm when it came to the other end of the political spectrum which wanted the tempo of changes faster than Gorbachev visualised. Economist Nikolai Shmelev was reported to have proposed, for example, that a certain controlled level of unemployment be allowed since it would be conducive to faster growth of the economy. Gorbachev reacted sharply and called the proposal "unacceptable". He declared that there could be no revoking of the rights to work, education, free medical services and housing that socialism had provided to the people. These he said were the "real values" of Soviet society.[26]

In the remaining part of the year, too, dissent came from those who wanted faster change. In August, one of Gorbachev's own advisers, economist Abel Aganbegyan, was found lamenting that progress was very slow and that there were still more failures than successes. He suggested the closure of hundreds of loss-making factories so that healthy enterprises could flourish.[27] The same month, Boris Yeltsin, at that time the Moscow boss and an alternate member in the politbureau, was reported to have expressed exasperation at the slow rate of changes.[28] These opinions also caused no alarm to Gorbachev, who declared very confidently in October that people must not panic. He said the next 18 months were hard but told people: "I tell you, honestly, it is going to be difficult at this time. But if we get our flywheel turning, a great deal will be added in our country, and very quickly."[29] He expressed similar confidence in November when he said: "Our road is not an easy one, but we have been climbing a mountain and now we have moved from shifting sands to firm ground. And that is why we will win out."[10]

In short, Gorbachev seemed to know both the direction and the pace of reforms he wanted, and refused to change either. He was absolutely confident of his success. It is with this confidence and firmness of views that he wrote the book. There was, moreover, nothing in the contemporary reading of Soviet economy by non-Soviet observers which could undermine Gorbachev's faith in his programme. On the contrary, while foreign observers had started in 1985 with the impression that perestroika would fail to take off, by 1987 most of them had granted the programme a fair chance of success. In October 1987, Stephen S Rosenfeld wrote in the *Washington Post* that

> The American debate over the Gorbachev reforms is coming to a new place. No longer is the focus on whether the reforms will deepen and stick. There is still much doubt on that question, but the working assumption now is that the reforms have a good chance of succeeding and that their success would be a passing geopolitical event.[11]

And yet we know that over the next few years the Soviet economy ran into rough weather, lost momentum as well as direction, nose-dived, and crashed, bringing down with it the Soviet state and burying beneath both what Gorbachev had inherited and what he had himself tried to build. Most probably, he had sensed the impending disaster, for it looked as though somewhere in the middle he gave up his original destination and decided to concentrate on crisis management and damage control. In the last analysis, though, nothing helped. The end could not have been farther from his vision. Instead of rejuvenating the economy, his schemes ended up dislocating the established planning and implementation processes. What ensued was chaos and severe crisis, marked by steep fall in GDP, crippling inflation, parallel black market economy, and corruption. When Soviet Union finally broke up, it had already become dependent on external aid.

It is the economic disaster of these later years which now looms large in scholarly analysis. It has also radically altered the way Gorbachev's earlier years are viewed. It has coloured appraisal of his motivations and performance of that time. I have argued elsewhere against this tendency of retrojecting the present into the past.[12] My attempt in this paper has also been to show that the entire period of 1985-91 was not uniform in character and should in fact be divided into two segments, with the borderline drawn somewhere around 1987-88.

But apart from combating retrojection as a method, I have also meant to lay in the foregoing pages the ground for an argument I wish to pursue from here onwards. It may in one sentence be anticipated as follows: what gave a fatal twist to the course of events in Gorbachev's Soviet Union was not the 'bad economics' of *perestroika* but the virtual impossibility of its politics.

In order to delineate my argument I require that we answer three interwoven elementary questions: one, what was it that Gorbachev saw as his ultimate socio-political ideal; two, what was it that he found wrong with Soviet Union as he assumed its leadership; and, finally, in what manner did he *originally* expect to set right what he had found wrong. The third question asks us not to see his tenure as an uninterrupted period in which he unfolded and explicated his policies, but to distinguish between his initial designs and the later, largely *ad hoc*, measures adopted while he was under the siege of unforeseen circumstances. It is primarily for this reason that I continue to depend on his 1987 book rather than his later statements.

It is the first question, however, that is far more fundamental. It asks us to guard against the common tendency to divorce Gorbachev from his larger vision and reduce him, so to speak, to a social engineer who merely wanted to 'fix' certain 'leaks' in the Soviet system.

What was Gorbachev's ultimate socio-political ideal?

One negative answer to this question would be that whatever else it might have involved, *laissez-faire* economy was certainly not a part of his vision. I have already quoted Gorbachev repeatedly emphasising that he considered socialist system far superior to free market. There are many more similar passages in his book. For example, he took notice of the fact that "Some politicians and media, particularly in the United States, have been trying to present perestroika as a drive for 'liberalisation'"[13] and tried to make it plain to them that

> we are conducting all our reforms in accordance with the socialist choice. We are looking within socialism, rather than outside it, for the answers to all the questions that arise. We assess our successes and errors alike by socialist standards. Those who hope that we will move away from the socialist path will be disappointed."[14]

As a matter of fact when we read the book today, some five years after its publication, one of its most striking features appears to be his persistent reference to socialism. It was for him that chosen ideology and system to which Soviet Union was firmly committed forever. It was the only goal, the only methodology and the only criterion to guide him. He referred to perestroika on the very first page as "an urgent necessity arising from the profound processes of development in our socialist society".[15] He mentioned the "awareness that the potential of socialism has been underutilised" as the source of his programme.[16] He was absolutely confident about the success of his policies for he believed that "due to socialist system and the planned economy, changes... come much easier than they would in conditions of private enterprise".[17]

But it is not enough to merely recognise Gorbachev's commitment to socialism. It is more important to understand what he

understood by it. Going by his own writing, there were two features of social and political life which he considered most central to the ideology: openness [glasnost] and democracy. For him "democratic forms [were] inherent in socialism"[38] just as "Openness is an attribute of socialism".[39] At another place he combined the three categories and held that "There is no democracy, nor can there be, without glasnost. And there is no present-day socialism, nor can there be, without democracy".[40] As a matter of fact, for him "The essence of perestroika lies in the fact that *it unites socialism with democracy*"[41] so that "The more socialist democracy there is, the more socialism we will have".[42] His total faith in democratic freedom and openness was revealed in his attitude towards intellectuals: "Someone objected, claiming that it would be difficult to work in an environment where each individual is his own philosopher, his own foremost authority, and believes that only he is right. I replied that it is far worse to be dealing with a passive intelligentsia, and with indifference and cynicism".

Now it is true that Gorbachev counted the passivity of intelligentsia, and the apathy and cynicism among the masses as some of the major causes of economic slowdown. But it is not for this reason alone that he wanted glasnost and democracy. They were not for him mere means to an economic end; they were intrinsic part of his ideal. At another place, he expressed his democratic resolve in the following words:

> There is only one criterion here: we will listen to and take into consideration everything that strengthens socialism, whereas the trends alien to socialism we will combat, but, I repeat, within the framework of the democratic process.[44]

We have, in a sense, already started answering the second question. *Apart from* the economic problems which he listed, what Gorbachev found wrong with the system was precisely the absence of democracy and openness. He spoke of the "gradual erosion of ideological and moral values of our people". He lamented that servility had been encouraged, and "a breach had formed between word and deed".[45] Moreover, he found the social and political malaise much deeper than the economic one. While he believed that the Brezhnev years were mainly to blame for economic stagnation, he thought that political and social degeneration had set in much earlier. Gorbachev traced the roots of "ossification of social thought" back to the Stalinist period when "the forms of development of socialist society that had ... into being under extreme conditions ...re made by Stalin's authority into ...ing absolute, and were regarded as ... only possible forms for socialism".[46] At ... place his criticism was far more ...it and harsh·

The emphasis on strict centralisation, administration by injunction, and the existence of a great number of administrative injunctions and restrictions belittled the rule of law. At some stage it led to arbitrary rule and the reign of lawlessness, which had nothing to do with the principles of socialism or the provisions of the 1936 constitution. Stalin and his associates are responsible for those methods of governing the country. Any attempts to justify that lawlessness by political needs, international tension or alleged exacerbation of class struggle in the country are wrong. Violation of law had tragic consequences which we still cannot forget and forgive.[47]

The answer to the third and the last question, namely, what he meant to do to set the wrong right, was summed up in Gorbachev's statement that perestroika was "simultaneously a revolution 'from above' and 'from below'".[48] He wrote: "The weakness and inconsistencies of all the known 'revolutions from above' are explained precisely by the lack of ...support from below". He held such support to be absolutely indispensable and hence emphasised that the revolution from below was "a distinctive feature and strength of perestroika".[49] His immense faith in the potentialities of Soviet people was expressed in some of the statements which I have already quoted in a different context in an earlier section. He believed until the end that Soviet people possessed profound wisdom as well as heroic capacity to make personal sacrifices, and constantly urged them to withstand what he considered were temporary difficulties. His unwavering confidence in them made it difficult for him to accept that separatist leaders were articulating popular aspirations. When republics started announcing one after the other their decision to leave the Union, he felt as though both he and his Soviet people had been stabbed in the back by power-hungry politicians. "I am convinced", he said in his resignation speech, "that decisions of this scale should have been taken on the basis of a popular expression of will" and added: "today I am worried by our people's loss of the citizenship of a great country. The consequences may turn out to be very hard for everyone".[50]

Such immense faith in the people and such commitment to democracy and freedom were unprecedented among Soviet rulers. Lenin, Stalin and Brezhnev had, in a fashion so typical of Bolshevism, treated Soviet people more often as the means than as the end of their grand designs. Their attitude had ranged from condescension to outright authoritarianism. While putting an end to the Stalinist oppression, Khrushchev had meant no less to keep political power concentrated in his own hands. Similarly, Trotsky might have looked towards the Soviet people in his moments of crisis and imminent defeat, yet he remained forever a Bolshevik whose faith in Leninist centralism did not waver for a moment. Throughout his life he held Stalin personally guilty for Soviet misfortunes, but it never crossed his mind that Bolshevik organisational principles might themselves be flawed. Had he succeeded in his struggle against Stalin, it was not unlikely that he would have steadfastly followed the same centralist methods, not realising that these had made the rise of Stalin possible in the first place. In contrast, Gorbachev appeared to be a truly unique democratic figure in Soviet history.

But let us take a further step. Let us ask what exactly the nature of his democratic sentiment was.

Answer to this question turns out to be far more complex than we might initially imagine, for Gorbachev the democrat appears fairly different when viewed from different vantage points. If we look at the following part of his resignation speech, for example, we are tempted to liken him to a typical western liberal. He said:

> not once have I regretted that I did not take advantage of the post of [CPSU] general secretary only to rule as a czar for several years. I considered it irresponsible and amoral. I am convinced of the historic correctness of the democratic reforms which were started in the spring of 1985.
>
> ...work of historic significance has been accomplished. The totalitarian system which deprived the country of an opportunity to become successful and prosperous long ago has been eliminated...
>
> I think it is vitally important to preserve the democratic achievements of the past years.... They must not be given up under any circumstances or any pretext, otherwise all our hopes for the better will be buried. I am saying all this straight and honest. It is my moral duty...

Here was a Gorbachev who could call Soviet Union a "totalitarian system" or a "command-bureaucratic system, doomed to serve ideology".[51] But how do we square up this liberalist stance with his answer to the first question? He had repeatedly asserted there that he was, above all, a committed socialist who judged his successes and failures by only socialist criteria? Unless we agree to dismiss him as just another opportunist turncoat, we are left with the only explanation that although Gorbachev himself was, and until the end remained, a genuine socialist, he was convinced that Soviet regime was far from it. He felt the regime was in fact nothing but totalitarianism masquerading as socialism. He found it so abhorring that he felt even liberal democracy was a great improvement over it.

That brings us to the second option. We may characterise him as someone who could belong in the social democratic movement of the Second International era. To that International had belonged Rosa Luxemburg, at once a heroic revolutionary and an

uncompromising democrat. It was her unwavering commitment to the democratic principle which made her say: "Freedom only for the supporters of the government, only for the members of one party—however numerous—is no freedom at all. Freedom is always and exclusively freedom for the one who thinks differently".[52] She had added:

> ... socialist democracy is not something which begins only in the promised land after the foundations of socialist economy are created; it does not come as some sort of Christmas present for the worthy people who, in the interim, have loyally supported a handful of socialist dictators....It begins at the very moment of seizure of power by the socialist party. It [socialist democracy] is the same thing as the dictatorship of the proletariat.[53]

But Rosa Luxemburg was, we must remember, not merely non-Bolshevik. She was an anti-Bolshevik socialist. It was her insight into what Bolshevism would produce which made her a very harsh critic of Lenin's organisational principles. She wrote:

> The ultra-centralism of Lenin is full of sterile spirit of the overseer. It is not a positive and creative spirit Lenin's concern is not so much to make the activity of the party more fruitful as to control the party—to narrow the movement than to develop it, to bind rather than unify it.[54]

Luxemburg's depiction of what the undemocratic nature of Bolshevism would eventually produce was so graphic that it now appears prophetic:

> ...Lenin and Trotsky have laid down Soviets as the only true representative of the labouring masses. But with the repression of political life in the land as a whole, life in the Soviets must also become more and more crippled. Without general elections, without unrestricted freedom of press and assembly ...only the bureaucracy remains as the active element... in reality only a dozen outstanding heads do the leading and an elite of working class is invited from time to time to the meetings where they are to applaud the speeches of the leaders, and to approve proposed resolutions unanimously—at the bottom, then, a clique affair—a dictatorship to be sure, not the dictatorship of the proletariat, however, but the dictatorship of a handful of politicians...such conditions must inevitably cause a brutalisation of public life...[55]

When Rosa Luxemburg, equated Bolshevism with the dictatorship of a handful of politicians, she did not appear to mean something very different from what Gorbachev meant by Soviet totalitarianism. Both also seemed to agree on the consequences of such politics. Luxemburg talked of brutalisation of public life while Gorbachev, we saw above, maintained that "profound distortions" and "lawlessness" had occurred in the country which had "hampered its development for decades and resulted in tremendous human losses and incalculable moral and ideological damage".

Given these striking similarities, it appears fair to reach the conclusion that Gorbachev was, in spirit and in substance, a social democrat. He was unwilling to sacrifice democracy at the altar of tyranny—even 'socialist' tyranny—because he believed that such socialism was no socialism at all. Socialism and democracy were two integral and inseparable parts of one and the same ideal.

But as we shall see in the following section, even this conclusion about Gorbachev has its problems.

VI

Quite like the liberalist Gorbachev, the social democratic Gorbachev had his limitations. Resemblance between him and Rosa Luxemburg stopped at their aversion to totalitarianism and its consequences. But had they been contemporaries, they would have differed violently on who was to blame for totalitarianism. While she thought Lenin was personally responsible for inventing and imposing inherently totalitarian Bolshevism, Gorbachev thought that degeneration had all occurred during the "personality cult and stagnation years". In other words, he laid the blame entirely at the doors of Stalin and Brezhnev. Nowhere did he mention that negative tendencies could have had their origin in the period of Lenin's leadership. Nowhere is there a hint that the malady could lie in Bolshevism itself. On the contrary, Gorbachev expressed at numerous places in the book his gratitude and great admiration for Lenin. His works, Gorbachev said, had proved to be "inexhaustible source of dialectical creative thought, theoretical wealth and political sagacity".[56] He accredited Lenin with the idea that "socialism and democracy are indivisible";[57] he attributed to him the idea of working people's self management;[58] he ascribed to him the wisdom of going "beyond...class-imposed limits" and recognising the "priority of interests common to all humanity over class interests".[59] But what may strike one above all is the following passage in which Gorbachev painted Lenin as a great democrat:

> I have long appreciated a remarkable formula advanced by Lenin: socialism is the living creativity of the masses. Socialism is not an a priori theoretical scheme, in keeping with which society is divided into two groups: those who give instructions and those who follow them. I am very much against such a simplified and mechanical understanding of socialism.
>
> People, human beings with all their creative diversity, are the makers of history.[60]

Once one reads this paragraph, one can no longer entertain the possibility of putting Gorbachev in the same category as Rosa Luxemburg. Though the two sounded very similar in the enunciation of their ideals, they could not have been more different in their reading of history. Gorbachev attributed to Lenin what Luxemburg thought was entirely missing in the Bolshevik founder of the Soviet state. Gorbachev acquitted Lenin of every charge that Luxemburg had levelled against him.

Where does that leave us?

Although I will need to reformulate it later, my initial response to this question would be that it leaves us precisely in the same indeterminate twilight zone as Gorbachev himself traversed. To look for precise categories in his case—to want him to be an unambiguous liberal, social democrat or Bolshevik—is to altogether miss the point about his paradox: he was all of these things and he was none of them. He felt pushed towards the reforms he considered absolutely essential, but he also felt pulled back by the tradition from which he had come and to which, in a profound sense, he still belonged.

This brings me to the core of my argument. I believe that while only he had to grapple with his predicament, his dilemmas were not of his own making. They were typical products of what I may call the 'hegemonic communist universe'. Central to the conception of this universe is Gramscian discussion of hegemony and hegemonisation. Gramsci employed these concepts primarily to denote class relations within a society, wherein one class became hegemonic by successfully establishing its moral, cultural, political and ideological leadership over other classes. However, I use these concepts much more broadly and loosely, and include in their purview relations not only among classes but also other formations, strata, groups, movements and indeed parties. My argument then is that Bolshevism, and more particularly its organisational ethos, was internalised by communist parties across the world as the very paradigm of authentic communist norms. Bolshevism was first imposed on other parties through the Third International but, true to the successful establishment of a hegemonic universe, it did not take long before communists began to follow Bolshevism quite voluntarily, not as a matter of discipline but as the very essence of communism. Bolshevik hegemony survived the dissolution of Third International and affected the functioning of world communism in a variety of deleterious ways.

It is my argument here that Gorbachev's politics too was rooted in the peculiar condition in which hegemony of Bolshevism had survived in the Soviet system as a whole. The point must be made at once that this hegemony did not manifest itself uniformly and consistently. Very often it could be seen, for example, not so much in the ideological content of Soviet policies as in the form in which policies had to be authenticated and

legitimised. Being the international 'vanguard', the CPSU had the advantage of interpreting and reinterpreting domestic and global 'correlation of forces'. It could then initiate policies which, at times, constituted complete departure from classical Bolshevik conceptions. But even in these cases it was invariably claimed that the policies merely elaborated classical principles or, at best, extended their application. The critical factor was that in order to be accepted, decisions had always to be taken in the name of the revolutionary tradition. This condition was usually met, at least apparently, by referring to some obscure work of Lenin, recognised as he was as the very embodiment of Bolshevism.

At this level, it is possible to read Gorbachev's repeated references to Lenin as an exercise in legitimisation of his extremely unorthodox programmes. This reading is supported by a certain pattern found throughout his book, whereby Lenin's name is invariably evoked just before or after making an unconventional proposal. Typical of this pattern is, for example, this passage: "He [Lenin] perceived the lurking dangers for the new system....Hence the utilisation of methods which did not seem to be intrinsic to socialism itself or, at least, diverged in some respects from generally accepted classical notions of socialist development".[61] Gorbachev did not reproduce Lenin's exact words here or anywhere else, nor did he provide the references. It is difficult to judge whether or not Lenin ever said the things Gorbachev made him say, nor do we know the context in which he wrote or said what Gorbachev chose to pick up. Gorbachev would say he did not find either of these things necessary since he was addressing the lay reader and not writing a scholarly book. But it is quite possible that these omissions were deliberate and were made because doing so suited his convenience. We are saying in other words that Gorbachev knew his policies were not Leninist and he was cheating on his reader.

I do not subscribe to this reading. But even if I were to accept it for the sake of argument, it will only go on to prove what is from my point of view a more significant matter: the survival of Leninist hegemony right up to the days of Gorbachev. Just as every leader before him had needed to use Lenin's name to "rule as a czar for several years", so did Gorbachev for his glasnost and perestroika. It showed that quite like the leaders before him, Gorbachev was aware that Lenin continued to provide the basic parameters for thought and action, trespassing which became instinctively unacceptable to the Soviet system as a whole. But to state that Leninist aphorisms could be used for rationalisation is not to say that they were always and necessarily so used. To hold such a position would be no different from subscribing to the crude powercentric notion of ideology. Also, when we look at his book more closely, we realise that Gorbachev's references to Lenin could not have been just a clever ploy.

I am much more persuaded that Gorbachev was a 'partially emancipated' member of the Bolshevik communist universe. In order to appreciate that, let us look at a passage which I consider crucial. It deals with Khrushchev and his de-Stalinisation campaign, and is important to us because Gorbachev is so often seen as having carried forward his policies. The portions relevant to us read as follows:

> A major landmark in our history was the 20th CPSU congress. It made a great contribution to the theory and practice of socialist construction. During and after, a great attempt was made to turn the helm in the country's advance, to impart an impulse to liberation from the negative aspects of socio-political life engendered by the Stalin personality cult.
> But the possibilities that emerged were not used to the full. The explanation is the subjectivist methods adopted by the leadership under Khrushchev...The leadership's wilful and changing ideas and actions kept society and the party in fever.
> That was why at the next stage, whose hallmark was the October 1964 plenary meeting of the CPSU central committee, the first step was to overcome these extremes and combat these extremes. A line towards stabilisation was taken: And it was a well justified plan.[62]

It is the second part of this passage which may come as something of a surprise to some of us. This is so because after having done what was only expected of him—lauding Khrushchev's de-Stalinisation campaign—Gorbachev did next what was most unexpected: he equally justified Khrushchev's ouster and the neo-Stalinist Brezhnev's rise to power. Such a stance would puzzle any reader of his book, for it was none other than Brezhnev whose tenure Gorbachev held mainly responsible for economic stagnation and ideological decadence. How could Gorbachev hold Khrushchev in great respect for his "great contribution to the theory and practice of socialist construction", and, at the same time, berate him for his "subjectivist methods" and "wilful and changing ideas"? Did it not occur to Gorbachev that coming from him, such criticism would appear very odd, given the fact that he had himself initiated not merely unorthodox but also highly controversial changes?

What was Gorbachev saying when he declared Khrushchev's ouster "a well justified plan"? We know that he admired neither Khrushchev's predecessor nor his successor. So he could not have meant to support either. And yet if we look at it closely enough, Gorbachev was not really contradicting himself. It requires perhaps another reading of the passage to realise that there was a consistency underlying his seemingly inconsistent position. Gorbachev was not supporting any person. He was supporting a principle—an organisational principle. Surely he was most conscious of the sharp contrast in Stalin's and Khrushchev's political objectives—he was critical of the former while he admired the latter—but he found something disturbingly akin in their organisational norms. In the pursuit of his goals, neither had hesitated to elbow the Soviet communist party out of the centre stage which it was originally meant to occupy. The "negative aspects engendered by the Stalin personality cult" had been only too obvious, but Khrushchev's '*subjectivist* methods' too amounted to nothing less than 'wilful' ideas. They kept "society *and the party* in fever."

Here we had, then, someone with untainted faith in the role of the communist party, trying tenaciously to secure its centrality against encroachment. Gorbachev's faith lay in the Leninist idea of flawless party machine, a vehicle of change and continuity, of transformation and moderation, and, above all, of continuous reappraisal. He wrote:

> The party acts as the initiator and generator of ideas, the organising and guiding force and, I would say, the guarantor of perestroika in the interests of consolidating socialism, in the interests of the working people. The party has assumed a truly historic responsibility. In 1917, Lenin said: "Having started a revolution we must go all the way." The same is true of perestroika: *The party will go all the way.*
> ...the party's goal is.. above all, to theoretically analyse processes, to sense critical points in the development of contradictions in time, to introduce corrections into strategy and tactics, to elaborate policy and define methods and forms for its realisation, to select and place personnel, and to provide for perestroika both organisationally and ideologically. *Only the party could do all this.*[63]

Gorbachev, in other words, internalised *at least one part*—vital, crucial and consequential part—of the Bolshevik vision. What seemed amazing about his faith was that it had come out unscathed from the ugly world of political realities, for he appeared as someone still inclined to think of the long years of Stalinism and neo-Stalinism as the exception rather than the rule. He was not a social democrat like Rosa Luxemburg whose sensibilities would be offended by Lenin's highly centrist methods and who would see in them the seeds of totalitarianism. He was a communist—a Bolshevik communist—whose faith had not been shaken even by the actuality of Stalin's totalitarianism. Explanation for what appeared amazing lies

in the very nature of hegemonisation process. It is important to underline here that an idealised picture of the universe rather than its realist representation becomes the basis of hegemony. After all what members of the universe internalise are the moral, cultural and political *values* (and not facts) of the hegemonic group. It is a separate matter that later, when hegemony is in place, even such conduct of the hegemonic authority as is contrary to the idealised picture gets rationalised and approved. In a passage which we have quoted above, Gorbachev himself referred to some of the bases on which Stalin's conduct, contrary to the ideals, was justified. These included "political needs, international tension or alleged exacerbation of class struggle in the country." Such justifications prove sufficient to comfort a vast majority of hegemonised members who feel unsettled more than outraged by the discrepancy between 'words and deeds'. But even the more critical, 'partially emancipated', small minority, which refuses to condone such violations, falls short of decrying the hegemonic authority *per se*. It more often gravitates towards identifying, isolating and indicting individual members of this authority. What remains unperturbed in this way is the hegemonic picture of the universe, which appears natural and objective, gives meaning to the communal life of the hegemonised members, and evokes spontaneous commitment. Its integrity is never doubted by the hegemonised members because such doubts induce self-doubts or doubts about the very meaning of communal life.

Gorbachev belonged to this small minority. He could see that enormous violation had been committed. But he held Stalin and Brezhnev responsible for vitiating the entire Soviet system. Unlike Rosa Luxemburg who could observe Bolshevism from the outside, Gorbachev could not understand the fact that Stalin was not the first Soviet leader to use extraneous justifications. Lenin too had used the metaphor of 'war communism' to justify a large number of undemocratic steps which did not square with his earlier promises. It was from the days of Lenin that Soviet people had come to accept many things which, going by the ideals, they should not have. They had accepted Stalin because the ground for Stalinism had been prepared right under Lenin's nose. Consequently, Gorbachev's criticism of Stalin went no farther than Khrushchev's criticism. Neither of them had traced Stalinism back to Lenin and to the very Bolshevik organisational principles. Both had restricted themselves to condemning his personal depravity. This approach must have come naturally to Khrushchev and Gorbachev, as it indeed did to all members of the Soviet intelligentsia. It is rare for the members of a hegemonised universe to grasp the painful reality that the bane lies in the very foundations of the universe. And starting as the founder of that universe, Lenin had gone on to become an integral part of those foundations.

I may now reformulate the remarks I made at the beginning of this section. I began by saying that to seek to categorise Gorbachev as a liberal, a social democrat or a Bolshevik was pointless for he was all of these and he was none of them. I still hold the same position but with the following modification. If we persuade ourselves for a moment to be less judgmental about him and get more interested in how he must have looked at himself, we are bound to reach the only possible conclusion that he saw himself the way he said he did: as a convinced and committed Bolshevik. He took from Bolshevism what was best in it and considered it intrinsic; he filtered out what was wrong and sinister in it and considered it only incidental. He was convinced that Bolshevism in its pristine form was flawless and that its later blemishes could be removed. He remained a committed Bolshevik because, for him, the ideology already contained in it the best of liberalism and social democracy while it offered something more.

Here was a typical partially emancipated member of the hegemonic universe: he saw idealised version as real, and reality itself as a perverse exception.

It was Gorbachev's faith in the 'pristine' form of Bolshevism, and his faith in that form's primordial appeal among the Soviet people, the children of 1917, that prompted him to attempt the most ambitious of dreams with the simplicity of a child. The distinction he had himself drawn between the intrinsic and the incidental in Bolshevism led him to visualise Soviet society in a likewise fashion. What he saw as intrinsic in it were socialist and democratic values, revolutionary commitment, Soviet patriotism, enthusiasm, creativity and the prospect of prosperity. What he saw as incidental was apathy, cynicism, corruption, crass materialism and stagnation. He saw the latter as no more than layers of silt and sludge which had settled and crusted on the surface of the former. Once these layers were removed, the glorious pristine shine would return. The zeal he showed in dismantling structures, in decentralisation, in removal of bureaucratic controls, and in dismissing corrupt officers came from such a belief.

VII

I wish to make the point that what gave Gorbachev exceptional daring and what eventually proved to be his undoing were precisely the same thing. Both his personal heroism and the eventual hopelessness of his reforms emerged from the manner in which he related to the Soviet reality. He saw, quite clearly and sharply, the economic, political, social and ideological rot surrounding him. He described it, too, very candidly and graphically. But in a deeper sense he was twice removed from it.

First, he observed reality not so much in the manner of a statesman—with the eyes focused on the distant goal but the ears held close to the ground—but from the high vantage point of an ideologue. His understanding of Soviet people in the 1980s seemed to follow straight from more than half a century old tradition of 'socialist realism'. They were seen not as they were but as they ought to have been, rearing to go at the first call for socialist reconstruction. It was this highly idealised vision which gave Gorbachev a rich moral fervour and made him go repeatedly to the people to seek vindication and strength for his plans which he believed they well understood and empathised with. His appeals did seem to enthuse people for a while. But the enthusiasm was deceptive, for its source lay not so much in Gorbachev's ideological and moral fervour as in his promise of materially more comfortable life. He rode on the crest of high material expectations of the Soviet people, but when the expectations remained unfulfilled, his appeals ceased to have effect.

What Gorbachev the ideologue did not understand was that he was making ideological appeals to a society that had been completely de-ideologised. It had been de-ideologised by Stalinist terror, bureaucratic unresponsiveness, arbitrariness, unfulfilled promises, shortages and corruption. But, above all, people had been de-ideologised by Bolshevik organisation of Soviet society. This organisation had turned active agents of history into passive sufferers or beneficiaries of the system. They were, as Rosa Luxemburg had predicted in 1918, "invited from time to time to the meetings where they ...[were] to applaud the speeches of the leaders, and to approve proposed resolutions unanimously."

But Soviet people had not been merely de-ideologised. Material deprivations and de-ideologisation had combined to make for crass materialism and cultural and spiritual poverty. To such people Gorbachev's ideology meant little. As Gorbachev unfolded his plans, it did not occur to him that more than providing material incentives, partial privatisation would lead to hoarding, black market and the underworld. It never crossed his mind that rather than encouraging involvement, creativity and responsibility, economic decentralisation could lead to breakdown of linkages and chaos. He must have imagined that democratic decentralisation and devolution of political power would inculcate greater faith in centre-state relations in the Union. What he seemed not

to have taken into account was that these steps could also fan demand for secession and produce inter-republic ethnic violence.

What Gorbachev did not understand, in short, was that the sedimented mire had corroded so deep into the system that the rot he considered extraneous to the Soviet bodypolitik had become its intrinsic part. Unaware of such risks, Gorbachev went ahead with reforms which brought down the entire system over his head. It was only much later that Gorbachev saw the mistake in dismantling the entire system as he had done. In a Soviet television interview in March 1991 he admitted that "It was inexpedient to reject what still worked, before creating new effective mechanisms ...I am not trying to avoid responsibility." He added that "It was possible to reach the gains of perestroika with less damage".[64]

But by the time this realisation dawned on him, it was already too late. And yet if we look back into Soviet history, we find that the extremely simplistic nature of Gorbachev's grandiose plans was not without precedents. The belief that an entire system could be supplanted all at once went back all the way to Lenin who had in his pamphlet *State and Revolution* put forth the idea of smashing up the inherited state with a similar faith. The consequences of implementing the grand plan in his case had been no different: the economy had collapsed. Despite that failure and despite the fact that Lenin had to very quickly retrace his steps, the faith had survived him through Stalin to Gorbachev. The three leaders might have been very different in what they wanted to replace or what they wanted to replace it with, but they were remarkably similar in that they shared the highest degree of voluntarism. This voluntarism was an integral part of Bolshevism, an ideology which had from the start believed in skipping or telescoping stages of history.

VIII

I said in the previous section that Gorbachev was twice removed from Soviet reality. I argued that his connection with Soviet society was severed as he visualised it in a highly idealised manner whereas the society itself had been completely de-ideologised. Let me now argue that he was also isolated from the CPSU, the agency in which he had great faith and which he saw the vehicle of change. The reason was his Bolshevism too was not what it had to his predecessors, and what it still was to his colleagues. It was, as we have above, a version that was highly idealised and rarefied—a product of partial emancipation. As a matter of fact, there was complete mismatch between what he thought was Leninism and what almost every other communist in the CPSU thought it was.

The mismatch showed at two levels. In the economic sphere, Gorbachev had drawn his inspiration from "Lenin's works in the last years of his life".[65] These works had propounded and justified the New Economic Policy, which made concessions to private trade and industry, and abandoned the pressure towards collectivisation. Lenin adhered to this policy from its inception in 1921 to his own death in early 1924. But soon after his death the NEP came to be treated as a tactical retreat which Lenin had meant to make only temporarily in the aftermath of the civil war. It was seen as contrary to the spirit of Lenin's economic philosophy in general. That is how Stalin justified its termination and reintroduction of collectivist methods in 1929. Later Soviet leadership and scholarship criticised Stalin for the political excesses he had committed but did not contest the position that Stalinist model of economic development was in line with Lenin's general economic philosophy. As a matter of fact, Khrushchev became a suspect because his policies were seen as too much of a deviation from this path. The long Brezhnev years returned to the familiar Stalinist model which had come to be equated with both Leninism and socialism.

In purely statistical terms, the economic model had shown spectacular results in the earlier decades of its implementation. It had been touted as the perfect evidence of the prosperity which socialist planning could bring to any country. Therefore, when growth rates began to fall, not everyone who mattered could see a direct connection between stagnation and this model as clearly

as Gorbachev saw, nor was he convinced that the highly unconventional methods based on Lenin's tactical retreat would promote either socialism or economic development.

No matter how much Gorbachev disliked to rule 'like a czar', he would not have been able to effect a dramatic redefinition of socialist economics without the unquestionable authority which his position as the general secretary of the CPSU gave him. The muted and cautious manner in which even politburo members expressed their misgivings, and the ease with which Gorbachev was able to disregard them, showed the extraordinary clout which each and every general secretary from the days of Lenin had wielded. Khrushchev's de-Stalinisation campaign had gone un-challenged precisely because he occupied the position which Stalin had made unassailable. Gorbachev's initial success was not very dissimilar in nature. But while those who differed with him did not disagree with him publicly and violently, they stuck on to their conventional notions regarding how socialist economy functions. The result was that while there was apparent consensus on the ideological basis of economy, in reality there was none.

Without his quite realising it, Gorbachev increasingly lost the support of conventional communists. For some time this loss was seemingly compensated by the support he received within and outside the party from the economic liberalisers. But that too was short-lived. Gorbachev had his own ideas about how much liberalisation was consistent with his version of socialism, and what he thought was permissible the liberalists found totally inadequate.

The second level of mismatching was at the political and organisational level. The vast majority of communists understood communist politics to mean, in practical terms, essentially two things: one-party system in which there was complete monopoly of political power in the hands of the communist party; and a completely hierarchical pyramidic structure within the party which was seen as the essence of 'democratic-centralism'. It is true that many of those who swore by this system also occupied privileged positions and derived disproportionate benefits from it. But it will be simplistic to argue that only such people were interested in preserving the system. The ordinary ranks and local leaders of the CPSU must have understood socialism to mean what was practised in Soviet Union. Most of them were born and brought up in the era when all these features were already in place. They must have been socialised into it and must have found it normal. They must have, in other words, behaved like unemancipated members of the communist universe. I am not saying that there could have been no communists in the party who, like Gorbachev, saw these features as perversion of socialist ideology. But their number could not have been large and, given the long years of Brezhnev rule, they could not have risen very high. Those who were elevated by Gorbachev himself did not seem to enjoy tremendous rank and file support. They could have given solace but not much organisational support to Gorbachev in the later years of his political career. On the other hand, those who tried to pull off the August 1991 coup may not have enjoyed tremendous public support, yet they could not have been entirely without sympathisers in the party. That is the only explanation for Gorbachev's moving so quickly to disband the party.

In the end, Gorbachev stood all alone. He was a liberal whose hesitant, halting attitude towards 'reforms' had exasperated liberals long ago; he was a communist whose debilitating effect on the party and government had made communists extremely wary of him; he was a social democrat, whose ambivalent and contradictory attitude failed to create a dependable base for social democracy in a soil from which it had been uprooted long ago.

No obituary to Gorbachev's paradoxical politics would have been more appropriate than the one a Moscow newspaper editor wrote:

> Gorbachev introduced chaos which destroyed the doomed empire. Trying to kill totalitarianism, he only managed to kill communism. Trying to impose freedom on the state, he killed the state. Trying to inoculate democracy to society, he destroyed society. Wishing to keep the empire intact, he destroyed the empire.[66]

When Gorbachev went down, he did not go down alone. A country that had fallen apart went down with him.

INDIAN BRANCHES

Schedule 17 – Notes on Accounts:

I. Summary of Significant Accounting Policies

1. General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country.

2. Transactions involving foreign exchange

(i) (a) Foreign currency assets and liabilities are translated on a daily basis at the exchange rates prevailing at the close of the day except for balances in Foreign Currency (Non-Resident) Accounts which are recorded at the relevant notional rates specified by Reserve Bank of India. Accordingly, monetary assets and liabilities other than balances in Foreign Currency (Non-Resident) Accounts have been translated at the exchange rates prevailing at the close of the year.

(b) Unmatured spot and forward foreign exchange transactions are revalued on a monthly basis at the then prevailing spot and forward rates respectively.

(c) Gains and losses arising from the above valuations are reported in the Profit and Loss Account.

(ii) Income and expenditure items have been translated at the exchange rates prevailing on the date of the transaction.

3. Investments

(a) Investments in Securities approved for the purpose of maintaining Statutory Liquidity Ratio requirement.

(i) Permanent Investments

Valued at cost of acquisition. The difference between cost of acquisition and maturity value is amortized/accrued over the residual maturity of the Security.

(ii) Current Investments

Valued at the lower of cost of acquisition or market value or yield to maturity at rates specified by RBI circular no. DBOD No. BP.BC 59/21.4.043/94 dt 17 May, 1994.

(b) Other Investments

Valued at the lower of cost of acquisition or yield to maturity at rates specified by RBI circular no. DBOD No. BP.BC 59/21.4.043/94 dt. 17 May, 1994.

4. Advances

Provisions for doubtful advances have been made to the satisfaction of the auditors.

— in respect of identified advances, based on a periodic review of advances, after taking into account the portion of the advances guaranteed by the Export Credit and Guarantee Corporation and similar statutory bodies and guidelines issued by the Reserve Bank of India.

— in respect of general advances, based on Management's estimate of potential exposure and taking into account guidelines issued by the Government of India and the Reserve Bank of India.

— provisions in respect of doubtful advances have been deducted from advances to the extent necessary and the excess has been included under "Other Liabilities and Provisions".

5. Fixed Assets

(i) Fixed Assets have been accounted at their historical cost.

(ii) Depreciation has been provided on the diminishing balance method at the following rates per annum:

Furniture and Fixtures	18.1%
Computers	40%
Electrical Fittings and Fixtures	33.33%
Equipment	33.33%
Vehicles	33.33%

(iii) Certain fixed assets which were provided without charge to the Branch by Head Office are included in these accounts at nominal value for the purpose of control

6. Staff Benefits

Provision for gratuity is made on the basis of an actuarial valuation. Provision for pension benefits is made on an accrual basis. Separate funds for gratuity and pension have been created

7. Net Profit

The net profit disclosed in the profit and loss account is after:

(i) provision for taxes on income in accordance with statutory requirements.

(ii) provisions for doubtful advances.

II. As at March 31st, 1994 the Indian Branches have changed the basis of presenting the asset value in respect of Commercial Paper and Certificates of Deposit disclosed under investment from gross basis to net of discount earned in advance consequently, the assets and liabilities are both reduced to the extent of Rs. 7,17,21,322.00

III. Previous year's figures have been regrouped and reclassified wherever necessary to make them comparable with current year's figures.

Auditors' Report

1 We have audited the attached Balance Sheet of the Indian Branches of Societe Generale (incorporated in France with limited liability) as on 31st March, 1994 and also the annexed Profit and Loss Account for the year ended on that date

2 In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read together with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956 The Accounts are therefore, drawn up to conform with Forms A and B of the Third Schedule to the Banking Regulation Act, 1949 Subject to the foregoing observations, we report that in accordance with sub-section (3) of Section 30 of the Banking Regulation Act, 1949

a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and have found them to be satisfactory,

b) The transactions of the Indian Branches which have come to our notice have been within the powers of the Indian Branches of the Bank,

c) In our opinion, proper books of account, as required by law, have been kept by the Indian Branches of the Bank so far as appears from our examination of those books,

d) The Balance Sheet and the Profit and Loss Account dealt with by this report are in agreement with books of account,

e) In our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by the Companies Act, 1956 in the manner so required, for Banking companies and read together with the notes, give a true and fair view

(i) In the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at 31st March, 1994 and

(ii) In the case of the Profit and Loss Account, of the profit for the year ended on that date

Concerns of Intelligentsia in Pakistan

Content Analysis of Newspapers

Nadeem Ul Haque
Arif Sheikh

A content analysis of a sample of daily newspapers in Pakistan reveals that they devote extensive space to international news. Domestic news is usually entirely confined to the statements of politicians and political parties with very little space given to economic issues or court proceedings.

MODERN DAY society relies on the media, an important component of which are newspapers, to disseminate information. In order to perform this role well, the media has to be comprehensive in its coverage. It has to inform the citizenry in an efficient manner on the diverse matters that affect Pakistan's society. Modern scientific, economic, and social development depends to a large extent on such a diffusion of knowledge by means of the media. Such an argument is often cited in support of the drive for mass literacy in many planning and intellectual circles.

Although the media comprises radio, television and newspapers, there are two reasons why we have chosen to concentrate this study on newspapers only. First, like many other developing economies and emerging democracies like Pakistan, the audio-visual media, radio and TV, is controlled by the government. Consequently, like most public sector owned enterprises, one cannot take this section of the media to be operating according to well defined market principles. To the extent that they are being run on non-market lines, market preferences cannot be deduced by means of a content analysis.

Second, all academic jobs as well as academic journals too, are in the public sector. Moreover, these journals tend to be very specialised and do not encourage academic debate. As a result, most Pakistani academics publish in newspapers and the few monthly and weekly magazines. The content analysis especially of the editorial/opinion page, therefore, reflects, in some sense, the opinions of the intelligensia. The debates and opinions expressed on these pages are important to study as they eventually shape the country's policy agenda. Syllabi of elite training institutes such as the civil service academy where the senior civil servants are trained draw upon the writings on the opinion pages of newspapers. The columnists and writers of these columns are all the main lecturers at such places. It is, therefore, important to determine the areas that this intellectual elite considers worthy of attention.

This paper attempts to determine, albeit a little crudely the extent to which the newspapers fulfil their role of an informant of society and a watchdog for the interests of the people. For this purpose we attempt to develop some quantification of the coverage of newspapers. Such a quantification is an important source for discovering, and informing the newspaper readership on, editorial preferences and decisions. If enough such information is made available perhaps the readers and editorial interests will be better mediated. It is therefore hoped that this line of research will be pursued by others and perhaps even on a continuous basis to keep everyone on their toes.

Unfortunately, because of the lack of resources, our research had to be quite restricted. We were, however, able to cover six major newspapers, four English and two Urdu but were unable to undertake a study of the newsmagazines. For the selected papers we covered only the more important sections such as the main headline, the opinion page, the editorials and the letters to the editor. Our simple analysis also overlooks another important dimension of understanding newspapers and their contents, that of the quality of the material presented. For example, simple exercises such as the extent to which opinion is well researched and the headline reflects fact and limits sensation, could be done. In that sense the paper should be regarded as a pilot or an illustrative exercise. It is hoped that this would catalyse a larger research project that will refine some of the analysis presented, increase the coverage of the print media, and adjust the quantification for quality.

Our intention was to classify the news, opinion and analysis appearing in newspapers into categories that are meaningful. The primary intent of this research was to determine the priority that editors and opinion-writers give to international versus domestic issues. Furthermore, within domestic issues, what weights do they lay on economic, social and court related issues.

Bearing these considerations in mind, we attempted a classification into five main categories: international news, current political situation, social news, economic news, and court-related news. International news represents views and events on issues such as Bosnia, Kashmir, Afghanistan, new world order, central Asia, etc. All political statements and announcements of the politicians in the government as well as in the opposition including rallies and press conferences of all prominent political parties and leaders are classified in the category of political pronouncement. The conjecture is that statements by these leaders are only made for the promotion of their own careers.

Within court decisions also, a distinction was made between those of an economic and a political nature. Since religion remains an important item for discussion in Pakistan, a classification for pieces that focused on religion was also maintained. In ideal circumstances of well-funded research, perhaps all the sections of the newspaper would be classified on a daily basis in terms of the actual space that was devoted to each category. Such a research would be able to develop many more categories and could even assign pieces to multiple categories.

Within these main categories we attempted some form of quality judgment. In the social and economic categories we attempted to define three sub-classifications. In the course of the analysis it appeared that there were too many pieces that were quite full of platitudes like 'Pakistan as an Islamic State', 'declining moral values', 'corruption', 'lament on poverty or literacy', 'exhorting self reliance', etc. We termed such pieces 'conventional wisdom/dogma'.

The quality pieces that we were looking for were either investigative pieces on any current economic or social phenomenon, or an interesting facet of government policy or administration as it affected those areas, or analytical informative pieces in the economic and social areas. Pieces that fell into this category were classified into a category termed as 'investigative or report of public complaint'. Consequently, a factual reporting of an event such as a seminar or a government policy announcement was termed just that, 'Factual reporting of a significant event'.

We have randomly selected about 156 newspapers (from January to October 1992) for data collection. As mentioned above, our analysis included four English newspapers (i e, *The Nation, The News, Frontier Post, Dawn*) and two Urdu newspapers (*Jang* and *Nawa-i-Waqat*).[1] The attempt was to draw randomly about 25 issues from each of these newspapers from the 10-month period, January to October 1992. Even for a limited exercise such as this the sampling ratio is not bad. We were able to sample about 8 per cent of the population which, by most standards, is quite reasonable.

Because of resource constraints, no attempt was made to cover the entire newspaper. Instead four areas that are probably the most important in the paper were covered: (i) the main headline, that reports that which the

editor considers most important, (ii) the editorials, which present the views of the editors on issues which the editor considers to be important, (iii) the opinion page which reflects the views of the elite, columnists, thinkers and the well known, and (iv) letters to the editor which reflect the concerns of the ordinary reader We are therefore able to contrast the views of three important actors in this business, the editors, the intellectual elite and the ordinary reader

The printed material on the selected sections was read and a classification determined Because of resource constraints, multiple or subsidiary classifications could not be done For the same reason, multiple enumerators to correct for enumerator bias also were not used For any one attempting to improve on this work these would be important areas to concentrate resources into However, despite all these problems, the study provides an interesting first look at the content of our newspapers

Main Headline

The most important part of a newspaper is the main headline The main headline is what is printed in the boldest and largest letters It is what the street hawkers used to shout out in bygone days to attract buyers The achievement of a headline story remains the dream of many a reporter and the stuff of which many Humphrey Bogart, Jimmy Cagney and Edward Robinson films were made Headline and headline stories also reflect the preferences of editors and/or owners of newspapers and many an owner like the famous William Randolph Hearst used them to considerable political advantage Crusader editors have been known to use headlines for their favourite cause

Unfortunately, third world governments have learnt this lesson well and have attempted directly as well as indirectly to control the headline in favour of the incumbent regime Editors are persuaded by many means, which include both the carrot and the stick to favour the incumbent for headline space

Our analysis of the newspapers in Pakistan focused on the headline in view of its importance to public perceptions We analysed all the stories in the main headline and categorised them according to their content as discussed above Table 1 presents the results Evidence suggests that the editor's favourite topics for headline news are international topics and political pronouncements of our politicians They devote roughly 35 per cent of all headline space to international events and some 33 per cent to political pronouncements (Table 1) Although data on newspapers from other countries was not immediately available to us but our hypothesis would be that our newspapers are perhaps more international than they need to be Moreover, given the attention that political pronouncements receive, newspapers seem to be either under the influence of the government, or remain in anticipation of some benefit from politicians Some factual reporting of some social event or happening is what can be termed the third favourite receiving about 27 per cent of the total headline space However judging from the evidence of the content analysis, the economy or court-related stories are certainly not what headlines are made of in Pakistan

As Table 1 shows, there is a clear divide in the treatment of issues between English and Urdu newspapers Perhaps in keeping with the desires of their Oxbridge educated and influenced audience, English newspapers devote a lot of their headline space to reporting international events[2] of the total English-newspaper headlines sampled about 52 per cent related to some international event In contrast, Urdu newspapers devoted only 19 per cent of their headline space to international news

The largest category to which headline space was devoted in Urdu newspapers was 'political announcements' About 42 per cent of sampled headline space was given to the reporting of announcements, press conferences and such like of political figures from both sides of the spectrum[3] This was the second largest category for the English newspapers using up about 23 per cent of total headline space

The next most important contender for headline space is the category of factual reporting of an event of a social or political character This is the second most important category that editors of Urdu newspapers like to use for a headline About 33 per cent of headline space in Urdu newspapers is devoted to it English editors however are not so generous in their assessment of this category and give it only 21 per cent of their headline space For them this is third in importance after international news and politicians' announcements

Interestingly enough both economic matters and news related to court proceedings receive more attention in Urdu papers than English newspapers While Urdu newspapers devote about 3 per cent of their headline space to economic matters English newspapers allow only 2 per cent of their space to be used for economic affairs Similarly, Urdu newspapers and English newspapers devote 3 per cent and about 1 per cent respectively to court-related matters

Perhaps reflecting the desires of their editors, there appears to be significant differences among individual newspapers For example *Dawn* seems to concentrate far more on international events, devoting some 79 per cent of headline space to this category Of the English newspapers, *The Nation* devotes the least space to international events but gives the largest weight to political pronouncements The analysis also suggests that *The Frontier Post* devotes more headline space to economic news than all other newspapers *The News* gives court related news the most coverage out of English newspapers

While the favourite subject of both Urdu

Table 1 What the Front Page Headline Covers

(As per cent of all headlines sampled for the concerned newspaper)

Newspaper (# Sampled in 1992)	International[a]	Political Announcements—Both Government and Opposition[b]	Social: Factual or Coverage of Significant Event[c]	Social: Investigative or a Report of Public Complaint[d]	Economic: Factual or Coverage of Significant Event[e]	Economic: Investigative or a Report of Public Complaint[f]	Court Proceeding: Political	Court Proceeding: Economic/Social
The News (26)	44 83	20 69	31 03	0 00	0 00	0 00	1 72	1 72
The Nation (27)	36 60	32 68	27 45	0 00	1 96	0 00	0 65	0 65
The Frontier Post (25)	43 40	25 47	25 47	0 00	4 72	0 00	0 94	0 00
The Dawn (26)	78 57	12 86	7 14	0 00	0 71	0 00	0 71	0 00
Nawa i Waqat (25)	29 72	40 57	23.58	0 47	3 77	0 47	1 42	0 00
Jung (26)	10 34	42 53	41 00	0 00	1 53	0 38	3 45	0 77
English newspapers (104)	52 08	23 41	21 23	0 00	1 97	0 00	0 88	0 44
Urdu newspapers (51)	19 03	41 65	33 19	0 21	2 54	0 42	2 54	0 42
All newspapers (155)	35 27	32 69	27 31	0 11	2 26	0 22	1 72	3 43

Notes a International issues such as reports on Bosnia India Kashmir etc

b Gratuitous publicity for politicians This would include press conferences rallies and announcements of the prime minister president PCA NDA MOM PPP etc

c Coverage of an social event—crimes functions community related events—because of the importance of the event and not because a politician graced the occasion

d Investigation of crimes government misdemeanours or reports of causes of various social phenomenon or complaints of citizens

e Factual piece reporting government figures without much analysis e g report of the annual budget

f Report of an analysis of economic policy or an economic phenomenon or event

newspapers is political pronouncements the second favourite topic for *Nawa i Waqat* appears to be international news while for *Jang* it is social events Interestingly in the weighting scheme of *Nawa i-Waqat*, economic matters receive a higher priority, in that of Jang court proceedings receive more attention

Editorials

The editorials convey more directly than any other segment of the newspaper the views of the editor The editorials are supposed to be directly written by the editor on subjects of his choice Though based on fact, the editorial is not supposed to be factual and informative By intention, they represent the views and opinions of the editor Editors use the editorials for issues of common weal and public interest By means of editorialising, the editor attempts to influence public both opinion and policy The subjects that editors pick for editorials, therefore reflect very clearly the orientation of the newspaper

Table 2 presents the results of the content analysis of the editorials for the four major English newspapers and two Urdu newspapers Interestingly enough, as in the main headline, the favourite topic of editors of English newspapers and the second most frequent topic for editorials in Urdu newspapers is international events Court-related matters continue to the least topic of interest for editorials

In all about third of all editorials are written on international news English newspapers are devoting about 32 per cent of their editorials to international events while Urdu newspapers commit 24 per cent to this category Surprisingly, while *The Frontier Post* was devoting the least amount of headline space to international events it takes the lead in terms of editorials on international news

For Urdu newspapers the category of conventional wisdom or dogma is the most important category for which editorials are written Indeed this is the second most important category for all newspapers with about 21 per cent of all samples newspaper editorials being devoted to it Among the Urdu newspapers, *Jang* gives the highest weightage to editorialising on subjects that can be interpreted as conventional wisdom However even in this category, the received wisdom in economics receives less attention than in the social area

The current political situation is surprisingly the subject of only 8 per cent of all editorials *The Frontier Post* and *The Nation* write the most editorials on the current political situation About 13 per cent of each of their editorials are written on this subject

Public complaints or investigations of some social or economic phenomenon are also made subjects of editorials Urdu newspapers are more concerned about social events while the English editorials are treating more economic complaints and investigations

While religion appears to be editorialised about 4 per cent of the time, *Nawa i Waqat* takes it up as an editorial subject more often than *Jang* Among English newspapers, *The Frontier Post* is writing most editorials concerning religion Perhaps a fair conjecture would be that the *Nawa i Waqat* editorials are probably more pro islamisation, while *The Frontier Post* represents the opposing viewpoint

The Opinion Page

In many ways the opinion page is the most interesting aspect of a newspaper The opinion page represents informed opinion on important subjects This is an area which allows newspapers to move away from the daily grind to strike a chord on longer term issues The opinion page is occupied mostly by the glitterati well known people from all walks of life including famous columnists In that sense, the opinion page represents the views of the elite of its audience Newspapers seek to distinguish themselves by means of their opinion pages

Of course the editor chooses what to put on the opinion page The editor, therefore has the final choice of the themes on the opinion page Thus, this page reveals information on the themes that are important to the informed readership of the concerned paper as well as the editor

The opinion pages in Pakistani newspapers appear to concentrate on international events and on delivering homilies on platitudes or what we term as conventional wisdom/dogma (Table 3) As before, opinion prices in English newspapers concentrate on international news while Urdu newspapers are more 'preachy' Among the English newspapers, *Dawn* and *The News* carry more articles on international events than others while among Urdu papers, *Jang* likes to preach more

Within the category of conventional wisdom/dogma all newspapers favour social and political themes more than economic Economic issues in general, receive little attention *The Frontier Post* and *The Nation* devote the largest space to economic issues on the opinion page *The Frontier Post* leads in carrying more analytical and investigative pieces on economic issues on the opinion page Most newspapers, however, are disappointing when it comes to their economic coverage [4]

For both Urdu and English newspapers, religious themes tend to be more important

Notes a International issues such as reports on Bosnia India Kashmir etc

b Coverage of recent political events such as the Sind situation announcements of the prime minister president, PDA, NDA, MOM, PPP, etc

c Coverage of an social event—crimes functions community related events—because of the importance of the event and not because a politician graced the occasion

d Investigation of crimes government misdemeanours or reports of causes of various social phenomenon, or complaints of citizens

e Factual piece reporting government figures without much analysis e g, report of the annual budget

f Report of an analysis of economic policy or an economic phenomenon or event

g As the name suggests articles affirming certain platitudes that are held dear in our society In the social areas, these would be ones that continue to decry our declining values or corruption in our society and role of the army or how we should become better Muslims In economics, articles that continue to issue clarion calls for self reliance reduction of poverty etc without any concrete analysis are included in this category

than the current political situation There is hardly any comment on the opinion pages on court decisions or court proceedings to the extent that the matter is not *sub judice*

Letters to the Editor

'Letters to the Editor' section of a news paper is the opinion page of the ordinary reader These are written by the little people who are not known and who have a viewpoint but do not wish to write lengthy pieces to air their viewpoint The views range from grandiose thoughts about the destiny of the country to complaints about the every day problems of the ordinary people For example all of us are familiar with the perennial plea in the letters to the editor section on government overbilling for services such as electricity or telephone Or the pleas for post ponement of examinations Given the lack of an efficient system of justice and the consequent reliance on bureaucratic arbitrariness for redress writing a letter to the editor remains an important means for attempting to seek justice As a result it would be an important area for future research to study this section of the newspaper in some detail For example the editorial selection process could be studied or the follow-up if any could be investigated The attitudes of the bureaucracy to the complaints that are voiced by this means should be examined

Despite the editorial selection that takes place in determining what gets printed in this column this section perhaps reflects best the

concerns of the ordinary reader. In that sense, content analysis of this section should provide an interesting contrast to the opinion page which the intellectual, social and economic elite dominates and the editorial page which is purely at the discretion of the editor. Such a comparison would serve to illustrate how well the editors are complying to the need of their readership. Table 4 presents the results of the content analysis. Results of only five newspapers are presented in this table since *Jang* does not have a letters section.

The results show that the writers of these letters do not share the internationalist perspective of editors and their elite clientele. Only about 6 per cent of all the letters covered in our total sample from all newspapers are related to some international event. Of these the English letter-writers tend to have a more internationalist perspective than Urdu writers. International perspectives constitute about 7 per cent of all English letters and only about 1 per cent of all Urdu letters.

Table 4 suggests that the letter writers in Pakistan are quite fond of pontification. About 34 per cent of all letters, 43 per cent of Urdu letters, and 32 per cent of English letters, are focusing on some platitude which is what we call conventional wisdom or dogma. Much of this pontification is of a socio-political nature. Economic pontification constitutes only about 6 per cent of all letters, 4 per cent of Urdu letters, and 6 per cent of English letters.

Another interesting contrast with the other sections is that letter-writers exhibit greater concern for social, political and economic ills. About 26 per cent of all letters are concerned with analysing an issue of a, or presenting a complaint of, a social, political and economic nature. Interestingly enough, Urdu writers show more concern with such issues: about 22 per cent of English writers and about 27 per cent of Urdu writers are concerned with social, political and economic issues. Furthermore, Urdu writers are more concerned with economic issues or complaints since 14 per cent of their letters are concerned with economic issues whereas only the comparable figure for English newspapers is only 6 per cent.

An element of editorial discretion is also worth commenting on. It seems that *The Frontier Post* is a newspaper that clearly appears to favour the publication of letters that relate to investigating, analysing, or complaining about an economic, social or political issues. *Dawn* appears to favour economic pontification while the *Nawa-i-Waqat* appears to have a strong bias for publishing letters related to the complaints of, or analytical issues relating to the economy.

Our simple content analysis has yielded some interesting conclusions: (a) Newspaper editors as well as elite columnists and opinion page writers are very internationalist in their perspectives. It would be interesting to make an international comparison to see if our hypothesis is borne out that we devote an inordinately large amount of newspaper space to international issues.

(b) The easiest approach to journalism appears to be to follow politicians for statements. A large fraction of the newspaper space is made available to be political newsmakers and their various press conferences and rallies.

(c) Opinion seems to be quite cliche-ridden with very little informative or analytical content. Most of the writers in the country appear to be comfortable in their notions. There is little that is written that challenges the priors of society.

(d) Very little attention is paid to economic issues or court related proceedings. Hardly any reporting of these serious issues in the main pages takes place. Some newspapers have business pages and even a weekly legal page. However, given the gravity of economic and judicial matters, there is no reason to not give them a larger space to them in the more important areas of the paper that we have analysed.

(e) Hardly any analytical or investigative work is printed. Issues of public concern or public maladministration do not receive the attention that they merit.

(f) As evidenced by the letters to editor, it would seem that the ordinary reading public do not share the views of the editors. Very little is written on international matters and on politicians. The people appear to be more concerned with (a) airing their views, and (b) voicing their complaints in the vain hope that they will be heard.

Why is it that the newspapers in Pakistan reflect these biases that alienate them from their readers? Certainly, they are not irrational and are responding to certain incentives. Three hypotheses can be suggested as possible explanations:

(a) Perhaps the easiest course is to print international wire services and politicians' statements.

(b) It is more profitable to print this innocuous international material and that related to press conferences and rallies of politicians. The bulk of the advertisement is that of the government as well as the bulk of the subscription. Moreover, most economic favours such as plot licences and preferential credit are also doled out by the government. Thus, why reflect socio-economic concerns and perhaps incur the wrath of the most important patron.

(c) The old McCaulay tradition of creating men of letters of us colonial gentlemen, has left a deep-rooted mark on the Pakistani intellectual. These intellectuals are now more internationalist in perspective. Their love for the aesthetic and the more poetic makes them romantic and fond of truisms. Certainly, as a society, we have placed no premium on the development of analytical or investigative skills. Consequently, it is not surprising that newspapers in Pakistan do not reflect any such skill.

Unfortunately, because of lack of resources our research had to be quite restricted. We were, however, able to cover the major newspapers—six in all, four English and two Urdu—but did not undertake to study any of the news magazines. For the selected papers we covered only the more important sections such as the main headline, the opinion page, the editorials and the letters to the editor. Our simple analysis also overlooks another important dimension of understanding newspapers and their contents, that of the quality of the material presented. For example, simple exercises such as the extent to which opinion is well researched and the headline reflects fact and limits sensation, could be done. In that sense, the paper should be regarded as a pilot or an illustrative exercise. It is hoped that this would catalyse a larger research project that will refine some the analysis presented, increase the coverage of the print media, and adjust the quantification for quality.

We have been able to develop a simple but meaningful classification for categorising news, opinion and analysis appearing in newspapers. In ideal circumstances of a well funded research, perhaps all the sections of the newspaper would be classified on a daily basis in terms of the actual space that was devoted to each category. Such a research would be able to develop many more categories and could even assign pieces to multiple categories. The data base that would be developed in this manner would with the help of personal computers and sophisticates statistical packages allow many interesting trends in newspapers to be analysed.

Perhaps if someone is able to develop this database on a continuing basis we could play watchdog on the newspapers in Pakistan. Maybe by exercises such as this, it will be possible to reorient the journalistic community from their currently excessively global or internationalist perspective to a keener interest for domestic concerns. In the same manner, such quantification might help to show that hard information, evidence and analysis of society and its problems is needed for developing ideas for social change. In that sense, opinion and cliche cannot be expected to substitute for hard work.

Notes

1 Even in this relatively frugal study, we have covered all the major newspapers. *Dawn* is the largest circulating English daily in Pakistan, while *Jang* is the largest circulating Urdu daily. Between *Jang* and *Nawa-i-Waqat*, we have captured probably the overwhelming majority of the Urdu readership. Similarly, the four English papers that we study are the most widely read in the country.

2 Foreign policy issues and external events play an important role in Pakistani politics. Zulfiqar Ali Bhutto's tenure as foreign minister, his policy on China and performance at the UN were all important factors in giving him stature eventually providing him with the leadership of the country

3 Traditional and feudal politicians, therefore have to do nothing to earn a headline. This may be an important factor in arresting political development in Pakistan. If headline space is distributed according to lineage and traditional political standing, the induction of fresh blood into politics becomes more difficult.

4 Some newspapers have special pages devoted to economic and legal issues. However, there are grounds for expecting that prime space, such as that on editorial and opinion pages, should also be allocated to these issues.

Traditional Science and Technology

Learning from Legacy

L Kannan

N VENUGOPAL RAO's critique of the Traditional Sciences Congress ('Learning from a Legacy: How and What?', February 5) is disappointing, not so much because the event is beyond criticism, but because he does such an inadequate job of it. It is typical of the effete intellectual reflex to look at everything through archaic doctrinaire goggles, that it precludes any meaningful debate. Nevertheless, it must be clarified at the outset that the choice of the term 'traditional', rather than 'people's', is deliberate. It is meant to assert the validity of the epistemology that evolved independent of the modern western metaphysical paradigm. On the other hand, what passes for 'people's science' is often a condescending exercise to make modern science intelligible to ignorant masses who are otherwise thought to be wallowing in millennia-old superstitions. The only outcome of such a people's science is to replace one priesthood with another. Contrary to what Rao contends, it is only by a re-assertion of tradition that one can break the hegemony of value-loaded modern S and T. Talk of S and T in modern India has remained nothing but an attempt at cultural terrorism aimed at bamboozling the public with feigned omniscience It declares as inadmissible the opinion of anybody other than 'experts', while the ruling elite goes about perpetrating holocausts like the green revolution, nuclear projects and mega-dams. It usurps the right to re-fashion society for 'public good', cowing down dissent with dire warnings about 'scientific temper'. An example of such epistemic hooliganism (that is so rampant in intellectual slums) is found in another article in the same issue of *EPW* on the banning of animal-slaughter. While welcoming the ban, the author bemoans that it was done on the initiative of 'rabid Ahimsa—advocacy by Jains', not on 'solid scientific and ethical' grounds.

Rao's carping about the definition of tradition is juvenile. The act of defining can only be undertaken as a post-mortem: not on something living and dynamic. Leave alone tradition, Paul Feyerabend (in 'Against Method') has pointed out the absurdity of trying to define even the oft-invoked 'modern scientific method'. Rao however betrays a gross lack of understanding not only about traditions, but also about the way modern S and T works For instance, his paranoia about science getting 'tainted with religious overtones' at the Congress is amusing, to say the least. One has only to read Newton's *Principia* to know the theological underpinnings of his work. Kepler's intuition could not have flowered but for his unshakeable faith in astrology and the occult powers of geometrical shapes In more recent times, Einstein turned his back on mounting scientific evidence to declare, "God does not play dice" He also insisted that science without religion is blind, and religion without science is lame Science has always been 'tainted',* often contributing to its creative ferment. If the ilk of Rao had insisted that practising, creative scientists should justify themselves by 'aiming at the positive aspects only', or by listing out the 'negative dimensions' of their endeavours, science would never have got off the ground. In fact, all this antiseptic talk about exorcising religion from science is hogwash, propounded by bandicoots in scientific bureaucracies and by technocrats—not by those who 'do' science. The success of such a strategy of self-aggrandisement has been such that today the compulsions of *realpolitik* have forced religions to taint themselves in scientific overtones. C V Seshadri, incidentally, is in the illustrious company of the likes of pythagoras and Ramanujan when he associates numbers with mystic concepts.

The opinion of Tapan Ray Chaudhuri (which Rao accepts as the gospel-truth)—about the position of an artisan in traditional Indian society—is a dogma that is as unsubstantiated by historical evidence as any other. For instance, the fact that a handloom weaver continues to play a socially and economically useful function after more than 5,000 years of his existence is a tribute to his creativity and entrepreneurship. Only someone whose mind is sick enough to judge a traditional artisan on the basis of fickle stock market bacchanalia will be blind to such unparalleled resilience. It is not surprising that Dharampal, who transcended such sterile interpretations of history with seminal contributions as early as 1971, should be the object of 'extravagant respect' at the Congress. His opinion on the Babri masjid, if expressed elsewhere, is irrelevant to the context of the Congress. Would Rao similarly assess the value of the Theory of Relativity in terms of its propounder's Semitic-Hindutva convictions? Einstein was a Zionist—a term equated until recently by the UN with racism. In this respect Einstein may be considered kindred to Murali Manohar Joshi, a professor of physics, who is today a flag-bearer of the Hindutva ideology!

Instead of resorting to the comfortable tokenism of 'accommodating major, minor and local' traditions as Rao recommends, the Congress went about the affair in the spirit of Deng Xiao Ping's dictum, "How does it matter whether the cat is black or white, so long as it catches mice?" It was left to armchair intellectuals to compute inanities like the 'percentage of representation to Qutab Minar in the conference'.

What the Congress has highlighted is that it is relatively easy to establish the value of specific scientific and technological traditions. The discourse now needs to be carried forward to address larger questions like the reorganisation of society and polity. However, any fresh possibilities will be foreclosed by demanding that ritual obeisance be paid to dark shibboleths like 'caste-oppression', 'women's exploitation', 'land-ownership' and 'inequality'. To take just one example of such colonial voodoos that fly in the face of facts, it is obvious that the participation of women in traditional technologies is far greater (and on a vastly more 'equal' footing) than that in their modern counterparts. But a debate on this will remain superficial unless the very notion of 'equality' is scrutinised. The naive western view of society as a race-track for a rat-race leads to futile efforts to get everybody at the same starting line. Eastern societies, on the other hand, were organised more like a volley-ball team where the players occupied different positions, but sought to complement each other harmoniously in tandem action. This is the essence of 'swadharma', meaning, that which flows from 'swabhava', one's innate physical and psychological characteristics, not mere birth—that Chaudhuri and Rao seek to crudely malign. Unfortunately, a slavish adherence to alien ideological baggage by our intellectuals has left the field open to hijacking by the very forces of Hindutva that Rao is so anxious to avoid.

Insistence on preserving the form of a borrowed scientific spirit has atrophied Indian creativity. In fact, while talk of 'scientific-

temper' and 'popularisation of scientific-outlook through literacy' has increased in post-independence India, productivity in modern science was decidedly superior prior to that (Bose, Raman and Saha, to name a few) Today we unabashedly import technology to make aerated water and potato chips Thus, an objective examination of the facts constrains us to scientifically conclude that there is an inverse correlation between scientific-temper and scientific-creativity Niels Bohr, who carried a yin yang symbol in his coat of arms, was fond of underscoring the need for an undogmatic approach to science His favourite anecdote was about a fellow scientist who kept a horse shoe, considered a good-luck charm by the 'unscientific', in his laboratory On being questioned about his belief in such a superstition, the scientist replied unfazed, "I am told it works even if I don't believe in it" Bohr went on to insist that while the opposite of a correct statement is a false statement, the opposite of a profound truth is often another profound truth Thus it is that whereas modern science considers the heart muscles to be involuntary, yogis routinely stop their heart-beats for long periods Saying with Mao, 'Let a thousand flowers bloom, let a thousand schools of thought contend", China has guiltlessly used acupuncture side by side with modern medicine Japan's progress is an instance of combining western science with a Zen world-view It is remarkable that since eastern philosophy is inward-looking it does not clash with any scientific paradigm—in contrast with western religion that collapses whenever an experiment is performed No wonder, there has been no Galileo in the Indian context In fact, today's dogma of science is a mere caricature of the atheistic and atomistic Samkhya philosophy, which in turn is only one of the 'shad-darshanas' (six schools of Indian philosophy)

The enfeebling of creativity by the hegemonistic sway of science-dogma is palpable India's scientific enterprise does not even have the robustness of the Indian film industry or Indian classical music Tied to the apronstrings of western science, our scientists are reduced to writing footnotes in journals of international repute' Wilting under increasing challenges, their response has been more pathetic than that of Doordarshan to satellite TV If religion was the opium of the masses, science has become the LSD of today's moribund intellectuals The pitfalls of their restrictive dogma are similar to what happened in Stalin's Soviet Russia when a wrong economic theory (Marxism) was elevated to the level of a philosophy of science We are in for a debilitating denouement of Lysenkoism

It is perhaps too much to expect our modernists to snap out of their petrified time-warp at this late hour It is likely that their past 'karma' has condemned them to eternal citizenship of that intellectual underworld which Peter Medawar calls 'Pluto's Republic'

Note

* While Leibnitz spent much of his time in political wheeling dealing, Cauchy was a royalist at the time of the revolution who diligently converted people to the Roman Catholic faith Lavoisier was sent to the guillotine for oppressing people as a tax collector Stark and Lennard (Nobel physicists) were rabidly anti Jewish Teichmuller, after whom a whole area of research in complex variables is named, was an ardent Nazi, while Pascual Jordan, one of the fathers of quantum mechanics, was a Nazi sympathiser Heisenberg adopted a neutral position in Hitler's Germany, and participated in the (unsuccessful) German nuclear bomb project Hamilton was a student of Sanskrit, with a deep interest in Indian philosophy, and Schrodinger was a keen student of the Upanishads, which he believed were consistent with quantum mechanics Sakata, whose research pre-dated Gelman's work on the Quark-model, claimed that his physics was guided by dialectic materialism Ramanujan was convinced that the goddess of Namakkal gave him mathematical theorems in his dreams Brian Josephson, who did his Nobel prize winning work on the Josephson Junction in his 20s, is now an ardent follower of Maharishi Mahesh Yogi's school of Transcendental Meditation In our own time, the Russian mathematician Shafaravich, considered the greatest number theorist today, is propounding anti-Jewish, anti western rhetoric, espousing a return to what he calls 'Russian values' in the post-Gorbachev era

Froman, a researcher into the cultural context which led to the flowering of revolutions in physics (namely, relativity and quantum mechanics) has come to the conclusion that the translation of eastern religious texts into German led to dramatic consequences

SICOM

STATE Industrial and Investment Corporation of Maharashtra (SICOM) has achieved a record performance in 1993-94 in terms of sanctions of term loans and participation in equity of medium- and large-scale units in the assisted sector as well as disbursements and recovery It sanctioned Rs 280 7 crore by way of term loans, direct subscription, underwriting support and leasing assistance which is an increase of 37 per cent over the previous year Further, the total recovery of principal and interest during the year was 18 per cent higher at Rs 122 5 crore Short-term loans and bridge loans sanctioned by it touched Rs 68 2 crore and the recovery of principal and interest in respect of these loans was Rs 60 5 crore

SICOM received commitments from the entrepreneurs to set up 369 new medium- and large-scale industrial projects involving an aggregate capital investment of Rs 3,733 crore Among these is a Rs 615 crore project for tractors at Sanaswadi in Pune, a Rs 67 crore automobile components project at Bhosari near Pune, a Rs 35 crore project for milk products at Nashik, a Rs 32 crore aquaculture project at Palghar in Thane, a Rs 38 crore project for bulk drugs and pharmaceuticals at Khalapur in Raigad district, a Rs 40 crore project for manufacturing tyres at Waluj in Aurangabad, a Rs 400 crore sponge iron project at Ghugus near Chandrapur in Vidarbha and a Rs 90 crore galvanised sheets project in Nagpur An aggregate amount of Rs 580 crore is expected to be catalysed through NRI and direct foreign investment in the state following commitments to set up projects from 31 NRI entrepreneurs and 17 companies with direct foreign investment from abroad These projects cover a wide range of products in the fields of photographic equipment, knitted fabrics, polycrylamides and other speciality chemicals, sophisticated drip irrigation systems, speciality oils, food products, marine food processing, etc

During the year SICOM also acted as lead manager/co-manager/advisor to 16 public/rights issues and provided underwriting assistance of Rs 95 crore to 90 companies in addition to completing 11 assignments relating to project appraisal, loan syndication, mergers/amalgamations, project counselling and restructuring services

IND NAVRATNA

EQUITY GROWTH SCHEME

- Capital appreciation likely.
- Assured allotment.
- 5 year scheme.
- No ceiling on investment. Minimum investment is Rs. 1000 (100 units).
- No tax deduction at source. Tax benefits under Section 80L, 112, 11(5) & 115E of IT Act 1961.
- NRIs, FIIs & OCBs get full repatriation benefits.
- Listing on Bombay & Madras Stock Exchanges.

The scheme is open from **15th to 25th June**

Date of allotment of units **1st July**

Application forms available & accepted at all branches of Indian Bank.

New Hindu History

The popular Hindu account of the history of Ayodhya has been completely transformed in recent years The distinguishing mark of the earlier Hindu account of this history was its metaphorical quality Ayodhya was a metaphor, as Ram was a metaphor, that stood for much more than the literal truth of the existence of a particular man/god or the geographical location of his capital. The new account of the history of Ayodhya and its association with Ram promoted by the right-wing Hindu movement of the last decade is in line with much of the 'modern' Indian effort to establish the historicity, rationality and masculinity of India and its religion(s). In fact it carries very much farther the positivism and literalism inherent in the understanding of modernity that has informed that tendency 1523

Poverty and Structural Adjustment

Policies to accelerate agricultural growth and infrastructure development and provide better access to subsidised food, along with measures to control inflation, promise to be most effective in reducing rural poverty in India On the other hand, structural adjustment, resulting in low priority to agriculture, slashing of public expenditure on the social sectors, including subsidised food, etc, will be detrimental to the poor and threatens to reverse the negative trends in rural poverty after 1969-70 1544

The Rebel

Gandhari is regarded as a symbol of the devoted wife who had even blindfolded herself because her husband was blind But was she really subservient to her blind husband who was, in the real sense, blind to all injustice and immorality? 1517

Interest Rates

The policy of imposing high interest rates on a stagnant economy is the direct result of the present policy-makers' preoccupation with success in the financial markets rather than with the growth of the real economy 1501

Reform by Decree

The Allahabad High Court's judgment on triple talaq not only trivialises the judicial system but also arrogates to the courts the task of reforming a minority y's personal laws. 1509

The pro-Narmada [illegible], buttressed by liberal state support, are turning aggressively anti-democratic in their attempts to thwart all expression of opposition to the project 1508

Debt Toll

Brazil's agreement with its international creditors on 'restructuring' $ 49 billion of commercial debt, though reached without the IMF's official stamp of approval, constitutes a final lethal blow to the country's social programmes, already in an advanced stage of decay as a result of successive 'shock therapies' 1506

Fuel Policy

A fuel-mix which can strike a balance between commercial and non-commercial energy sources is essential if the growing population is to be provided more energy even while energy is to be conserved in view of the exhaustible nature of commercial energy sources 1529

Without Food

Severe malnourishment and high mortality are characteristic features of the child population in the tribal villages of Birbhum district 1513

New World Disorder

The rebellion in Chiapas, Mexico, provides a glimmer of hope that the 'new world order' will not so easily be put into place 1514

LETTERS TO EDITOR

Zapatista Declaration

THE following is the full text of the declaration from the Lacandon jungle by the Zapatista Army of National Liberation It may be of interest to readers

We are a product of 500 years of struggle first against slavery, then during the war of independence against Spain led by insurgents, then to avoid being absorbed by North American imperialism then to promulgate our constitution and expel the French empire from our soil and later the dictatorship of Porfirio Diaz denied us the just application of the Reform laws and the people rebelled and leaders like Villa and Zapata emerged, poor men just like us We have been denied the most elemental preparation so they can use us as cannon fodder and pillage the wealth of our country They do not care that we have nothing absolutely nothing not even a roof over our heads no land no work no health care no food nor education Nor are we able to freely and democratically elect our political representatives nor is there independence from foreigners, nor is there peace nor justice for ourselves and our children

But today, we say enough is enough We are the inheritors of the true builders of our nation The dispossessed we are millions and we thereby call upon our brothers and sisters to join this struggle as the only path so that we will not die of hunger due to the insatiable ambition of a 70-year dictatorship led by a clique of traitors that represent the most conservative and sell out groups They are the same ones that opposed Hidalgo and Morelos, the same ones that betrayed Vicente Guerrero, the same ones that sold half our country to the foreign invader, the same ones that imported a European prince to rule our country the same ones that formed the scientific Porfirsta dictatorship the same ones that opposed the petroleum ex propriation, the same ones that massacred the railroad workers in 1958 and the students in 1968, the same ones that today take everything from us, absolutely everything

To prevent the continuation of the above and as our last hope, after having tried to utilise all legal means based on our constitution, we go to our constitution, to apply article 39 which says 'National Sovereignty essentially and originally resides in the people All political power emanates from the people and its purpose is to help the people The people have, at all times, the inalienable right to alter or modify their form of government'

Therefore, according to our constitution, we declare the following to the Mexican federal army, the pillar of the Mexican dictatorship that we suffer from, monopolised by a one-party system and led by Carlos Salinas de Gortari, the maximum and illegitimate federal executive that today holds power

According to this declaration of war we ask that other powers of the nation advocate to restore the legitimacy and the stability of the nation by overthrowing the dictator

We also ask that international organisations and the International Red Cross watch over and regulate our battles, so that our efforts are carried out while still protecting our civilian population We declare now and always that we are subject to the Geneva Accord, forming the EZLN as our fighting arm of our liberation struggle We have the Mexican people on our side we have the beloved tri coloured flag highly respected by our insurgent fighters We use black and red in our uniform as our symbol of our working people on strike Our flag carries the following letters, 'EZLN Zapatista Army of National Liberation and we always carry our flag into combat

Beforehand we refuse any effort to disgrace our just cause by accusing us of being drug traffickers, drug guerrillas thieves or other names that might be used by our enemies Our struggle follows the constitution which is held high by its call for justice and equality Therefore, according to this declaration of war, we give our military forces the EZLN the following orders

First Advance to the capital of the country, overcoming the Mexican federal army protecting in our advance the civilian population and permitting the people in the liberated area the right to freely and democratically elect their own administrative authorities

Second Respect the lives of our pris and turn over all wounded to the International Red Cross

Third Initiate summary judgments against all soldiers of the Mexican federal army and the political police that have received training or have been paid by foreigners, accused of being traitors to our country, and against all those that have repressed and treated badly the civil population and robbed or stolen from or attempted crimes against the good of the people

Fourth Form new troops with all those Mexicans that show their interest in joining our struggle, including those that, being enemy soldiers, turn themselves in without having fought against us, and promise to take orders from the general command of the Zapatista Army of National Liberation

Fifth We ask for the unconditional surrender of the enemy's headquarters before we begin any combat to avoid any loss of lives

Sixth Suspend the robbery of our natural resources in the areas controlled by the EZLN

To the people of Mexico We, the men and women, full and free are conscious that the war that we have declared is our last resort but also a just one The dictators are applying an undeclared genocidal war against our people for many years Therefore we ask for your participation, your decision to support this plan that struggles for work, land, housing food, health care education, independence, freedom, democracy, justice and peace We declare that we will not stop fighting until the basic demands of our people have been met by forming a government of our country that is free and democratic

Shaky Recovery

THE latest projections on the prospects for the world economy this year and the next seem to present a brighter picture than earlier ones Agencies such as the International Monetary Fund (IMF), the United Nations, the Bank for International Settlements (BIS) and the Organisation for Economic Co-operation and Development (OECD) had been initially taken aback by the rapid and widespread onset of recession in 1990 (1988 for the UK), just as they were surprised by its persistence till 1993, for four years running They have also been making predictions of recovery year after year which have proved to be over-optimistic All their projections, made till last year, of the growth-scenario for 1993 and 1994 have had to be revised downwards Now, however, there is a change with the IMF's *World Economic Outlook*, released last month, projecting a rise in world output of 3 per cent in 1994 and 3 7 per cent in 1995 after modest increases of 1 8 per cent and 2.3 per cent in 1992 and 1993 respectively The UN's *World Economic Survey 1993*, published some months back, had placed world output growth in 1992 at a mere 0 6 per cent and 1 5 per cent in 1993

But even as signs of an economic recovery are being flashed, a number of features of the world economy are far from reassuring First, in earlier trade cycles, say in the early 1980s, the growth of world output in the recovery phase had been much sharper, after four years of recession during 1978-82, world output had grown by 0 5 per cent in 1982, 2.6 per cent in 1983 and 4 5 per cent in 1984, compared to 0 6 per cent in 1991, 1 8 per cent in 1992, 2 3 per cent in 1993 and probably 3 per cent in 1994 This is only partly explained by the sharper output losses in earlier recessions

Second, the latest recovery is yet not widespread enough Among the major industrial countries, the US, Canada and the UK and among the rest only Australia have experienced a return to vigorous growth. For the other industrialised countries, the recovery projected last year has proved elusive In particular, the performance of Germany and Japan continues to be disappointing While US output is expected to expand by 3 9 per cent in 1994 and 2 5 per cent in 1995 and UK's by 2 5 and 2 8 per cent, output growth in Japan and Germany is likely to be within the 0 7-0 9 per cent and 2 1-2 3 per cent range in the two years. The European Union (EU) as a whole registered a negative growth of 0 3 per cent in 1993 and the projections for 1994 and 1995 are modest at 1 3 per cent and 2 5 per cent. The factors contributing to the American recovery have included the early resolution of the household debt question, reduction in interest rates and spurring of residential construction, as also stepped-up equipment purchases by business enterprises, sharp depreciation of the dollar and impetus to exports On the other hand, the Japanese economy continues to be constrained by the persistent strength of the yen and the severe contractionary effects of decline in asset prices. Business enterprises in Germany face high cost of borrowing owing to the country's tight monetary policies pursued for fear of inflation. In fact recoveries have occurred in the US and UK after they deviated from traditional monetarist policies—expansionary policies in the US and a fiscal stimulus package combined with lower interest rates in the UK The pound's withdrawal from the EC's exchange rate mechanism also freed the UK of its commitment to maintain a virtually fixed parity with the deutsche mark

Third, while the industrialised countries have achieved substantial reduction in inflation rates, the high social cost of the effort is reflected in the peaking of unemployment at 35 million in these countries as a whole in 1993 Current unemployment rates in the European countries are, as the IMF has noted, three to four times what they were in the 1960s and 1970s Unemployment in the European Community was expected to rise to 10 5 per cent in 1993 and to remain there in 1994 Economic growth over the past decade and more, except perhaps in the US, has been appropriately described as jobless growth Even in the US, where the unemployment rate has declined somewhat to a little over 6 per cent, some 30 million people now live below the poverty line

Fourth, a major contribution to world output growth has come from the developing countries which as a group have registered growth rates of 5 9 and 6 1 per cent in 1992 and 1993, respectively, and are expected to grow further by 5 5 and 5 8 per cent in the next two years But this achievement is attributable to China and a narrow band of countries in south-east Asia A majority of the countries of Latin America, Africa and south Asia as well as the entire group of so-called economies in transition, the countries of eastern Europe and the erstwhile USSR, remain mired in economic difficulties The African LDCs grew by just 0 1 and 1 1 per cent in 1992 and 1993, whereas the economies in transition suffered absolute declines in output of 15 5 per cent in 1992 and 8 8 per cent in 1993, in 1994 they are expected to show a further output loss of 6 1 per cent

Further, despite the higher growth rates of the developing countries during the past decade, the structure of the world economy has moved in favour of the developed market economies As per the latest UN data, their share in world GDP, 72 6 per cent in 1982, had risen to 74 4 per cent by 1992 True, the gain has been at the cost of the transition economies whose share of world GDP dwindled from 11 4 per cent to 7 8 per cent But the increase in the share of the developing countries was hardly dramatic, from 16 per cent to 17 8 per cent

The extent to which the developed market economies have benefited from the collapse of the former socialist countries is evident from the fact that the latter's share in the former's exports has gone up from 29 3 per cent in 1980 to 42 9 per cent in 1991. The bulk of the developed market economies' imports takes place within the group, such intra-group trade has in fact gone up from 66 7 per cent in 1980 to 77 3 per cent in 1991 There has been some increase in the intra-group trade of the developing countries, but it has not been as significant as that amongst the developed economies The LDCs' share of world imports rose modestly from 30 8 per cent to 34 6 per cent between 1980 and 1991 Overall, there can be no gainsaying that the developed market economies' domination of the world economy continues to grow

KASHMIR

An Opportunity

PUBLIC postures of inflexibility by both the Indian and Pakistan prime ministers negate whatever little efforts or gestures are made to bring about normalcy in Kashmir, the latest such gesture being the release of the JKLF leader Yaseen Malik on bail.

While Narasimha Rao in Washington tried to impress American congressional page-boys (who, according to the US press, filled in for the absent legislators and packed the hall for Rao's address to the joint session of the US Congress) by comparing their Texas with 'our' Kashmir (implying that accession in both cases was final), Benazir Bhutto at around the same time told a US newspaper that Pakistan could never agree to an independent Kashmir, implying that her government would covertly continue to train terrorists and smuggle them into the valley. In order to force its accession to Pakistan, this is obviously the only course left to Bhutto since, as she herself admitted during the same newspaper interview, given a choice all Kashmiri Muslims may not opt for joining Pakistan. Thus both Rao and Bhutto, in blatant disregard of the wishes of the people of Kashmir, are bent on imposing on them their respective political arrangements. Ironically, both enjoy their present positions thanks to electoral exercises conducted in both the countries that allowed their respective citizens to express their political choices. Yet neither of them is prepared to grant the Kashmiris their right to choose the type of political status and administration that they might want. As far as New Delhi is concerned, 'democracy' for the people of the valley can be exercised only within the straitjacket of the settled fact that Kashmir is a part of India, thus denying them the right to choose other options. As for Islamabad—which all these years never bothered to pay even lip-service to the principles of 'democracy'—a democratically elected prime minister today has no qualms in reverting to the traditional military autocratic strategy of forcing the people of Kashmir to accede to Pakistan. While New Delhi uses its security forces to keep the Kashmiris within the Indian Union, Islamabad uses its armed mercenaries to force them to accede to Pakistan. These mercenaries are recruited from among the Afghan and west Asian stragglers, bereft of any ideological cause after the fiasco of the Islamic fundamentalist adventure in Afghanistan on the one hand and the expected end to the Palestinian conflict on the other. Judging by reports, it is these foreign mercenaries who are now calling the shots in the valley, marginalising the indigenous Kashmiri militants who went for military training to Pakistan in the sincere belief that the latter would help them win independence.

The home ministry's decision to allow the JKLF leader Yaseen Malik after his release to visit Kashmir, where he was given a tumultuous welcome, acquires political significance at this juncture. Malik, addressing the crowd of his supporters in Srinagar, offered an olive branch when he said that the guns in Kashmir can be silent if New Delhi agrees to unconditional talks with all the parties involved in the Kashmir dispute—the various militant groups in the valley, the Hindu 'pundits' and the official representatives of Pakistan, as well as intellectuals and human rights groups who had been concerned about cases of human rights violation in the valley.

But are the bureaucrats in the home ministry and the ministries of external affairs and defence, who work at cross-purposes in framing their Kashmir policy, capable of advising their respective ministers how to take up the gauntlet thrown by Yaseen Malik? Do the ministers themselves have any political will and sincerity to listen to the voices of the Kashmiri people? Besides, will Benazir Bhutto be able to restrain the irresponsible ISI officials from beefing up the Hizbul Mujahideen? Rigidity and incompetence in policy decisions on both sides of the border will continue to plague the valley.

BANKING

A System at Stake

THE country's financial system is in disarray. The much-vaunted achievement in what may be termed financial engineering with the setting up of the all-India term-lending and investment institutions and in particular the nationalisation of the commercial banks is in jeopardy. There were two specially notable characteristics of this erstwhile achievement: first, the supply-leading role assigned to the banking and financial system and, second, the decisive place of societal goals in the policies and programmes of the financial system.

The new banking policies that are succinctly described in the RBI's latest *Report on Trend and Progress of Banking in India* leave little room for the pursuit of these objectives any more. True, if infrastructural development is poor and if real economic conditions, such as land and other asset distribution, leave much to be desired, the financial system is bound to face serious constraints. Likewise, there can be little doubt that in the long run it is the strength and vitality of the banking and financial system that will determine its ability to play the societal role expected of it. But the notion that serving the interests of the vulnerable sections and underdeveloped regions should necessarily be uneconomic is far from proven.

The misgivings regarding the direction in which the financial system is being led are induced by a number of considerations. First, while the new reform policy would also promote financial engineering, it would be such as to foster massive absorption of funds in stock market assets and treasury operations of banks and financial institutions. The entire discussion in the *Trend and Progress* on profitability of banks and their investment management gives overwhelming importance to the risk-reward perceptions of banks on their advances and investments in government securities. It is claimed that the introduction of capital-to-risk-weighted ratios for banks as a capital adequacy measure based on developed country standards "has resulted in the banks becoming more prudent in extending additional credit, unlike in the past when excessive credit had been widely prevalent". But there is little concern over the banks' reluctance to make advances precisely at a time when more bank credit is essential for reviving the recession-hit economy. The RBI's report shows no awareness of the dangers of applauding banks' risk-reward perceptions to the neglect of their role in financing economic development. Investment in the abundant supply of government securities available at bureaucratically-determined high yield rates, financing share market assets directly or indirectly and a marked preference for treasury operations will all fetch high rewards; they will also absorb the bulk of bank funds so that banks' need to soil their hands in lending to the productive sectors will be minimised. That these developments are bound to cause serious harm to the development process is evidently no concern of the RBI.

Second, while the report is expansive in dealing with the various aspects of financial sector reform, such as capitalisation of banks, rationalisation of the interest rate structure and identification of non-performing assets, it is distinctly short on issues concerning the societal dimensions of banking policy. For instance, there has been a continuous decline in the proportion of bank lending to the priority sectors, from 39.5 per cent in June 1991 to 37.1 per cent in June 1992 and further to 34.4 per cent in June 1993. Likewise, as against the norm of 18 per cent of total net bank credit, agricultural advances constituted 15.6 per cent, 15 per cent and 13.9 per cent, respectively, on the above dates. Except providing details of relaxation of priority sector norms, there is no critical evaluation of the reasons for the uniform failure of all groups of banks to fulfil their social obligations, let alone any assessment of what it implies for the country's economic development. This is also true of the details provided on assistance rendered under the government's special employment and asset-creating programmes, namely, the IRDP, SEEUY and SUME. Bank lending has consistently declined under all these programmes. More significantly, the credit-deposit ratios in many of the [illegible] like Kerala, [illegible] West [illegible] and [illegible] Pradesh and some [illegible] have further come down. True, a few [illegible] forces have been constituted to study the reasons but concern over such developments is not reflected in the broader perception of the banks' role in economic [illegible] the RBI report.

Finally, there is little analysis in the report of the problem of the banks' non-performing assets and sickness in industry The report for the previous year had placed the aggregate domestic non-performing advances of all public sector banks at 13 59 per cent of total outstanding advances as at the end of March 1991 and at 14 46 per cent as at the end of March 1992, the absolute amount was Rs 17,389 crore for the latter period The latest report puts non-performing assets at as much as Rs 36,588 crore or 24 2 per cent of aggregate outstanding advances of Rs 25,000 and above as at the end of March 1993 At least another Rs 1,000 crore have to be added on account of non-operating small advances of less than Rs 25,000 each To what extent is this more than doubling of non-operating assets as reported by banks within a year due to genuine transpareney as required by the new prudential system of income recognition asset classification and provision of bad debts and how much is it due to laxity on the part of banks in recovering their dues? The question remains unanswered in the report That there is more to it than meets the eye is indirectly evident from the data on sick and weak industrial units reported by banks for the years 1990, 1991 and 1992 The total outstanding bank credit blocked in such units (both SSI and non-SSI) was only Rs 9 930 crore, Rs 10,768 crore and Rs 11 533 crore, respectively, in the above years The inflated estimate of non-performing assets suggests that banks wish to pre-empt the possibility of the specially constituted Recovery Tribunals making them recover loans from their more difficult (or more favoured) borrowers The RBI s tolerant attitude to banks' risk reward perception will only go to strengthen their lackadaisical approach to recovering their past loans

INDUSTRIAL RELATIONS

Employers' Offensive

RUNGTA, a senior vice-president of FICCI the New Delhi-based apex body of India's chambers of commerce and industry, placed a charter of demands before the West Bengal government at a press meet in Calcutta on June 6, which sounded almost like an ultimatum Exemption of all new industries from the purview of the labour laws for at least five years, making gherao a cognisable offence, guaranteeing new industries exemption from power rationing for five to seven years—these were some of his major demands He complained that in West Bengal "labour laws have not been applied in the manner they should have been" This, of course, is true, but not in the speaker's sense In reality it is the employers who have been guilty of violating—and with impunity—many vital labour laws They have been flouting provident fund rules and defaulting to deposit nearly Rs 200 crore on this account, nearly two-thirds of the total amount of default in the whole country Lock-out by employers generally accounts for about 90 per cent of the mandays lost in the state and mostly in violation of the legal provisions

Whatever the reality, the FICCI vice-president, however, has a star witness in his favour Jyoti Basu, the state chief minister, himself has been persistently running down the working class and their movements in this state from employers' as well as workers' platforms Although, as already mentioned, strikes account for only about 10 per cent of the mandays lost, Jyoti Basu never misses an occasion to advise workers to use this weapon with restraint and discrimination He also has been advising them to change their outlook and improve their work culture, whatever that may mean Disparagement by the chief minister who also happens to be the seniormost vice president of the CITU the CPI(M) s trade union centre, combined with the general climate of ascendancy gained hy the employers under the present NEP regime has given the employers' apex hody confidence to launch a new offensive against the workers right to action in self-defence in the face of the tightening pincer squeeze of inflation and loss of employment West Bengal, being viewed as the foremost centre of militant trade unionism (which in fact is a dated notion), the employers have targeted it for muzzling in the first instance, with a view to ultimately enabling union labour minister P A Sangma to push his anti-labour bills through parliament The latest ultimatum, therefore, has grave national implications

Against this backdrop, the recent conference of the CPI led AITUC assumes particular significance This session, attended by the party s national leaders, expressed highly critical opinions about the West Bengal government s labour policies In a resolution the conference observed that the state government had failed to help workers when they were retrenched factories were locked out and managements had defaulted in depositing provident fund dues In an implied reference to the chief minister's dictum, a veteran CPI leader and one of the pioneers of the communist movement in the country, Ranen Sen, now in his mid 80s, asked "Who is going to teach work culture to the owners?"

It is, however not very likely that the CPI-AITUC's caveat will have much impact on the West Bengal government's policies and practices The test of the CPI's sincerity in defence of the working class interests therefore, lies in the party's follow-up actions Will it carry forward this struggle within the West Bengal government and the Left Front, of which it is a partner—even if this adversely affects the party in the ministerial stakes?

NUCLEAR SAFETY

Case for Inquiry

THE mishap at the Kaiga nuclear power plant when a part of the reactor dome under construction collapsed, and the subsequent decision of the Atomic Energy Regulatory Board (AERB), following an inquiry, to order the suspension of containment construction work on all the sites draws attention to the implications of risk factors in nuclear power generation In the course of the inquiry, the AERB found that there appeared to be a discrepancy between the approved design and construction methods and those that were being followed at Kaiga Pending a parallel check and review of these factors at all the sites, the AERB has, perhaps for the first time in its existence, decided to take the momentous step of suspending construction work on nuclear projects which have aroused so much protest and are already long delayed

Curiously, the project authorities initially tried to dismiss the accident as being of little consequence However they have been overruled hy the AERB's wiser decision For, the point is that assessment of risk in a nuclear power plant is altogether different For instance, while equipment failure or 'human error may cause a limited accident in conventional plants in a nuclear plant their potential for damage is manifold and extensive in time and space

While the nuclear establishment has often claimed that the number of accidents or 'incidents' which have occurred in the history of nuclear power generation in India are remarkably few, there have been increasing reports of numerous averted accidents from equipment failure or human error According to the International Atomic Energy Agency's cumulative data on the operating experience of nuclear power reactors all over the world equipment failure accounts for about a quarter of the outages in power plants However, in the Indian plants equipment failure accounts for over 80 per cent of outages This means that most outages are unplanned and add to the unreliability of power from these plants It is no wonder that all these plants produce less than their rated power output

More importantly, except in Tarapur 1 equipment failure has been most often in the main reactor area such as reactor cooling systems, reactor accessories auxiliaries, fuel handling and storage systems reactor control systems and instrumentation etc This is true not only in old plants like Tarapur or very new plants but even in those which are supposed to be in their peak performance stage Certainly these failures are not accidents or even 'incidents but they are an indication of the possible risks due to poor design or quality of construction which the nuclear establishment however vigilant cannot guard against While supporters of nuclear power have been extraordinarily proud of the successful indigenisation and innovation in design and construction in the area, it is perhaps time for the AERB to inquire into the excessive equipment failures

The AERB's role is due for restructuring with the finalisation of the IAEA convention on nuclear safety, after three years of deliberations While the convention the first of its kind, has been heavily criticised by

groups like Greenpeace for its "total lack of enforceable safety standards or penalties", and for the fact that it covers only civilian land based power reactors excluding the 300-odd research reactors, and the military installations, it nevertheless provides a template for creating criteria for safety standards in member countries For instance, the mandatory data sheets on nuclear plants which member countries submit to the international body will have to be substantially enlarged in scope and this will mean a more comprehensive understanding of what constitutes risk

POLITICAL PARTIES

Few Urban Allies

A RECENT convention of 'some 800 farmers and intellectuals' in Bombay is reported to have decided to launch a new party, modelled on the extinct Swatantra Party founded by C Rajagopalachari, with the able support of M R Masani way back in 1959 Masani, appropriately, appears to be an inspirer of the recent move while the farmer-leader Sharad Joshi is its key organiser This new move clearly aims at linking the interests and actions of propertied elements in the rural and urban sectors Here lies the essential commonality between the old Swatantra Party and the new venture But their divergences will perhaps be more significant

Rajaji s offspring evolved out of the convergence of the Ganatantra Parishad of the feudal princes and the fiercely anti Nehruvian Forum of Free Enterprise of Bombay industrialists Behind the new venture at the moment stands only Sharad Joshi's farmer base limited primarily to the Maharashtra region The urban link at the moment is apparently supposed to be provided by 'intellectuals' a rather nondescript category The press report did not mention any name from this cerebral sector Its industrial connection also is equally tenuous, if not totally missing at present With the bonanza of the ruling NEP the industrialists being the recipients of the most favoured treatment from the powers that be do not need any pressure group for promoting their general interests In other words, with enemies like the present government, the industrialist class will hardly need friends ! Hence Sharad Joshi is unlikely to ecure any effective urban allies from that quarter

Moreover the history of the old Swatantra Party is a mixed story It shone in the Indian political firmament rather dimly and for a while only soon to withdraw from the scene without a trace After a modest debut with 18 members in the Lok Sabha in the 1962 (third general) elections the Swatantra Party made a moderately spectacular appearance in 1967 with 44 Lok Sabha members only to be cut down to eight in the following round in 1971 The next step was its self-liquidation through the merger with other forces, ironically including fierce socialists like George Fernandes, to form the Janata Party in 1977

Even at its zenith, the old Swatantra Party had its bases only in the feudal-dominated regions of Gujarat, Orissa and Rajasthan Rajaji and Masani had failed to give it any significant urban connection Today Sharad Joshi and his fellow-travellers may provide the party with a more consolidated farmer base in some areas, but not many urban allies, who have clearly identifiable contradictory interests, at least over the terms of trade of agricultural commodities

Hence, if the old Swatantra Party had begun with a whimper to meet an early extinction, its reincarnation this time may be a cripple at birth itself!

YEMEN

Chimera of Unification

WHILE the UN initiative to diffuse the crisis in Yemen has only just begun and will take some time to yield fruit there is ground to suggest that a longer term solution to the Yemen problem need not necessarily be based on a unity of the north and the south At the same time, reports indicate a lack of popular enthusiasm for the war even in the south, from which it follows that the war must be brought to an early end However, the strategic situation on the ground is such that it would take some effort and time to persuade the militarily dominant northern side to agree to a permanent ceasefire

Already the northern forces have overrun a substantial portion of the territory of the south and are now surrounding the city of Aden, the southern capital, from three sides The calculation of the northern leaders seems to be to stall the beginning of the process of negotiations till they have captured Aden, so that after that point they could negotiate for a reunified Yemen in which they would continue to hold their currently dominant position In the unlikely event that this calculation fructifies the grounds for the conflict between the north and the south would continue to exist, for it was precisely this dominant position of the northern leaders in the government of the unified Republic of Yemen and the consequences it had for the people as well as the leaders of the south that has led to the present war

The Republic of Yemen had all the trappings of a democratic regime The latter came into being as a result of elections held in April 1993, three years after the unification But in a country of 14 million people, of whom only 2 2 million belong to the south, the south based Yemeni Socialist Party (YSP) could win only 56 seats in the 301-seat assembly The largest number of seats (121) went to the conservative Peoples' General Congress (PGC) of Ali Abdullah Saleh of the north which then formed a tacit alliance with the Yemeni Gathering for Reform (YGR), an Islamic fundamentalist outfit that won over 60 seats Although a number of posts in the unity government were given to the YSP, its leader Ali Salem al Beidh was yet to be sworn-in as vice-president nine months later Other members of the YSP were kept in the government on humiliating terms For example, the authority of the prime minister, who hailed from the south, was so little that he could be kept waiting by the military police before being allowed into the capital city, Saana. There were attempts to eliminate the members and supporters of the YSP through political murders Between May 1990 and January 1994, 152 members of the YSP, including a cousin of al Beidh, had been killed The government of president Ali Abdullah Saleh suspected the loyalty of the people from the south Therefore no efforts were made to unify the formerly independent armies, nor were troops removed from the old north-south border Finally, vice-president al Beidh had proposed an 18-point formula to reform the economy and the administration, the proposal was accepted but was never implemented

Given mounting international pressure, in which the US, Britain, the Gulf Co-operation Council (GCC) except Qatar and Egypt have joined ranks against Saleh, and the threat of intervention by Saudi Arabia in favour of the south, it is possible that the north Yemeni side would make at least an appearance of abiding by resolution 924 of the Security Council which calls for a ceasefire Already Lakhdar Brahimi, the special UN envoy to Yemen, who went on a fact-finding mission has reported 'slight progress' According to him, both north and south Yemen have agreed to the institution of a ceasefire monitoring commission The north, after initial reluctance, has even accepted the south's demand for foreign officials to be included in the commission

However, while the likely composition and the exact brief of the commission are not yet clear, if it bases its proposal for a permanent ceasefire on condition of a unified Yemen, it would not have achieved much For, the issue in Yemen is not the war between the two Yemens but an equitable existence for the people of south Yemen Such existence they were denied during the nearly four years of the unification with the north and it can only rest on proportionate distribution of the economic and administrative resources between the two A reunification of what are once again two separate Yemens is not the only way this distribution can be ensured Therefore, a continuation of the present arrangement, provided the south is able to regain the territories it has lost to the north during the present war, may well be just the solution that is required To make this solution viable what is needed is international recognition of the southern Democratic Republic of Yemen, which seceded from the north on May 21, and pressure on the north to return the captured territories of the south

›ngview Tea

LONGVIEW TEA COMPANY, a Calcutta-based Deepak group company which started off with a single tea estate in 1879, today has six gardens under its wing which are spread over Darjeeling and the plains of North Bengal The company which has a production of over 30 lakh kgs comprising of all varieties of tea—Darjeeling, CTC as well as Green—has now embarked on a growth plan which will increase its production by 60 per cent In addition to setting up two new tea estates in the districts of North Dinajpur and Cooch-behar in West Bengal the growth plan also envisages a massive expansion-cum-diversification programme for its existing tea estates The programme is also expected to lead to a substantial improvement in the quality of tea produced in addition to higher production thereby resulting in lower costs and increased realisation To part finance these projects the company plans to enter the capital market with a public issue of 13,72,000 equity shares of Rs 10 each at a premium of Rs 55 per share on June 29 The issue aggregating Rs 8 9 crore which includes reservations for India Magnum Mutual Fund, Morgan Stanley Mutual Fund, Kothari Pioneer Mutual Fund, UTI, IRBI and shareholders of Deepak Spinners, will be lead managed by SBI Capital Markets

Indo Holland

Indo Holland Agro Exports is entering the capital market with a public issue of equity shares aggregating Rs 3 5 crore to part finance its floriculture project The company is setting up a modern sophisticated greenhouse complex with climatic control systems near Gurgaon with production and post-harvest facilities for growing and export of exotic varieties of cutflowers to Europe and west Asia The complex is being set up in technical and marketing collaboration with Flodac BV, a well known Dutch floriculture company which will also make available a senior consultant for supervising the entire production harvest, post-harvest and export logistics at critical times The company plans to utilise the latest equipment and facilities from Holland and Israel for setting up an 'unbroken cold chain' including modern computer controlled high humidity cold storage and reefer vans for transportation to the international airport situated nearby The company has entered into a five-year agreement with Flodac BV for arranging auction of cutflowers at major Dutch auction houses or direct sale to any European country While production of rose plants has already started, commercial production is expected to commence in October which is also the beginning of the export season

Ind Navratna

Encouraged by its performance in 1993-94 Indian Bank Mutual Fund (IBMF) has launched Ind Navratna a five-year pure growth scheme aimed at generating substantial capital appreciation The scheme which ensures full allotment is the first scheme from IBMF which is open to non resident Indians overseas corporate bodies and foreign institutional investors on repatriation basis The company's other growth schemes namely Ind Ratna Ind Sagar and Ind Moti presently have net asset values of around Rs 23 9 Rs 21 2 (face value Rs 100) and Rs 14 5, respectively entailing an annualised yield of 57 per cent, 41 per cent and 32 per cent respectively The scheme is open between June 15 and 25 and its units will be listed on the Bombay and Madras stock exchanges

Asia Pacific Financial

Asia Pacific Financial Services (formerly SIFCO Finance) is presently engaged in trading in shares, corporate merchant banking and investment services, financial services, project consultancy, investment counselling and specialised services to NRIs The company now plans to carry on other activities such as merchant banking, investment banking, investment broking, international financial advisory services foreign fund advisory services and portfolio management To consolidate its capital base, augment long term resources to meet the needs of its expanding business as also to give a greater thrust to its non-fund based activities the company plans to enter the capital market on June 27 with a public issue of equity shares at par The issue aggregating Rs 2 8 crore will be lead managed by Prudential Capital Markets

Fem Care Pharma

Fem Care Pharma which is engaged in the production of cosmetics and pharmaceuticals and markets its products under the brand names 'Fem', 'Bambi' and 'Saka', plans to enter the capital market on June 20 with a public issue of equity shares at a premium of Rs 30 per share The issue is to part finance the company's expansion-cum-diversification programme which envisages the expansion of its existing capacity from the present 120 mt to 675 mt per annum setting up of facilities for ayurvedic and allopathic creams and ayurvedic tablets with an installed capacity of 325 mtpa and a developed tissue culture project to cultivate alone with a micro biological testing laboratory The company plans to source its raw material requirements for herbal juices in ayurvedic products from its proposed cultivation project

Jumbo Bag

A Madras based company incorporated in 1990 Jumbo Bag is entering the capital market with a public issue of equity shares at par on June 22 The issue is to part finance the setting up of a 100 per cent export unit for the manufacture of flexible bulk packaging made of synthetic fabrics The project which is estimated to cost Rs 10 7 crore is being set up in technical collaboration with Structure Flex UK The company has also signed MOUs with Sidian Trading, UK, and Langston USA for marketing four lakh bags and three lakh bags per annum, respectively After commencing commercial production in October this year the company hopes to achieve a capacity utilisation of 60 per cent in the first year of production The promoters who have over two decades' experience in the packaging industry will have a 56 14 per cent stake in the post issue equity

Starchik Specialities

Starchik Specialities a Hyderabad-based company engaged in the production of dressed/frozen chicken and animal feed is now setting up a broiler processing plant with an installed capacity to process 1,500 birds per hour and produce 4 050 mt of dressed/frozen chicken per annum In addition the company also proposes to manufacture 18,000 mtpa of animal feed on franchise basis at three units located at Hyderabad, Rajahmundry and Vijayawada The project which is estimated to cost Rs 5 4 crore is to be financed entirely through a public issue of equity shares at par which opens for subscription on June 21 The company which will market its animal feed under the brand name 'Starfeed', has signed an MOU with Alburq Exports, Dubai for the export of 40 per cent of its processed meat for a period of five-years The project is expected to commence commercial production in August 1994

There has been a slight edging down of the over the year inflation rate but the underlying inflationary pressures on food items persist Amongst the consumer price indices the largest rise has occurred in the index for agricultural labourers Though there is some moderation in the growth of M_3 it cannot be said that liquidity bulge of the past year is being unwound for this year RBI credit to the government is being replaced by other banks credit to government While scheduled commercial banks' deposit growth has accelerated credit growth continues to be sluggish Equity prices have again resumed their upward trend with the BSE sensitive and national indices now recording more than 85 90 per cent increases over the 12 month period

ts: (i) Superscript numeral denotes month to which figure relates, e g, superscript 7 stands for July. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year. (iii) –; ieans zero.

TITAN INDUSTRIES

Rising Market Share

TITAN INDUSTRIES (TI) (formerly Titan Watches) has emerged as a major manufacturer of quartz watches in the country with a 60 per cent market share Coupled with the 15 per cent market share of Timex Watches (whose production is sold and marketed by TI) the company's effective market share stood at 75 per cent of Indian market quartz analog watches and about 15 per cent of the estimated 18 million watches sold in the country every year including mechanical quartz and digital watches from all indigenous and imported sources both legal and otherwise Belonging to the Tata group of companies TI has the country's largest integrated quartz watch and component plant employing 2 000 people and using the latest technology For the year 1992 93 while the company's net sales rose by [illegible]4 per cent over the previous year operating profit improved by 2 8 per cent However the company's margins were under pressure due to the recession in the consumer durable market high interest rates increase in operating cost and the sharp increase in excise levies and consequently net profit fell by 2 5 per cent During the year the company's equity capital rose by 57 5 per cent following conversion of its 12 5 per cent convertible debentures and the rights issue of equity shares in December 1992 The debenture conversion and rights issue have added nearly Rs 61 7 crore to the company's reserves taking its book value from Rs 14 53 to Rs 28 41 Despite the fall in net profit and the rise in equity capital the company hiked the dividend rate from 20 per cent last year to 22 per cent involving a proportionately higher dividend outgo

Production during the year touched 2 7 million movements 1 5 million cases and 2 6 million watches which represented a growth of 5 per cent [illegible]4 per cent and 15 per cent, respectively over the previous year with the case plant at Hosur and assembly unit at Dehra Dun achieving full rated capacity Despite the recession in the consumer durable market the company managed to increase sales in volume terms by 15 per cent to 2 57 million (2 24 million) watches while sale realisation increased by 23 per cent over the same period Meanwhile exports rose significantly by 75 per cent to Rs 6 crore with the company continuing to expand its coverage of west Asia Though imports for 1992 93 amounted to Rs 37 5 crore the company expects to become a net foreign exchange earner in 1994 95 and also expects to enter the UK market The company's ongoing capital expenditure plan which is estimated at around Rs 225 crore constitutes Rs 107 crore for capacity expansion and indigenisation Rs 23 crore for jewellery watches Rs 33 crore for the jewellery manufacturing unit Rs 35 crore for infrastructural support and Rs 27 crore for investment in associated companies including Timex Titan Time Products and Titan Properties In line with its strategy to go global TI plans to launch a range of watches and jewellery in Europe in January 1995 for which it has floated a wholly owned subsidiary in the Netherlands Titan Holdings BV with an approved investment of $ 2 million It plans to move an application for an additional capital infusion of $ 6 7 million The foreign exchange will be utilised for setting up European operations and to purchase the Titan brand name which is at present held by Andimesa a Spanish family of watchmakers

Meanwhile the company's plans to increase its capacity to 3 5 million watches through productivity improvements and by the addition of balancing equipment Case manufacturing capacity which has already been enhanced in 1992-93 from 1 2 million to 1 6 million cases per annum is again to be increased to 2 2 million and the case plant now plans to concentrate on more sophisticated and expensive cases

For the year 1993 94 the company notched a turnover of Rs 228 8 crore while net profit soared to Rs 19 1 crore Meanwhile the company's Hosur plant has run into rough weather with the management declaring a lock out at both its watch factory and jewellery unit Production had been affected since June 1 due to a flash strike by a section of the labourers who are demanding reinstatement of a female trainee

WOCKHARDT

Seeking Offshore Funds

Wockhardt the Bombay based pharmaceutical company which went public in early 1993 saw a 40 per cent rise in net sales and a 29 7 per cent rise in operating profit in 1992 93 After a 8 4 per cent decline in interest charges and a rise of 10 7 per cent in depreciation provision, net profit fell to Rs 19 6 crore for the year The fall in net profit was somewhat deceptive for, there was a large non operating income last year at Rs 16 2 crore on account of write-back of depreciation which does not appear this year A net foreign exchange earner, the company's exports during the year rose by 25 per cent to touch Rs 13 2 crore Over the last five years its sales have grown three times, profits by seven times and fixed assets base by 2 5 times Further, it plans to invest an estimated Rs 100 crore in a new plant and newer technologies in the next three years With the company spending more than one per cent of its net sales on R and D its existing facilities are ranked among the finest in the country Its new Rs 10 crore R and D centre for research into pharmaceuticals, bulk drugs, biotechnology nutrition ayurveda and packaging development was expected to be commissioned in December 1993 The company's public issue which was made at a hefty premium has added more than Rs 53 crore to its reserves taking its book value to a phenomenal Rs 83 77 (Rs 43 53)

The company's new bulk drugs plant at Ankleshwar was commissioned three months ahead of schedule in April 1993 and its LVP plant expansion was expected to become operational in early 1994 It has plans to set up a subsidiary in the UK christened, Wockhardt Europe, which will explore the avenues for importing goods from India and selling them in the European and American markets Wockhardt International a wholly owned subsidiary of the company saw a more than 300 per cent rise in net sales and a 100 per cent rise in net profit

With the successful completion of the company's recent $ 75 million global depository receipts (GDRs) issue it has become the first Indian pharmaceutical company to raise offshore funds and the first Indian company to do so at a P/E multiple of 22 The issue which was made at a 3 per cent premium on the current market price, will increase the company's equity by Rs 17 5 crore and enlarge its net worth to Rs 390 crore, which it claims is the highest in the industry The proceeds of the issue will go towards part financing the company's diversification plans in bulk drugs and other research projects

Meanwhile for the six months ended December 1993 the company earned a net profit of Rs 16 5 crore on net sales of Rs 85 4 crore

MERIND

Diversification Plans

Merind, incorporated in technical and financial collaboration with Merck and Company of the US, is engaged in the manufacture of chemicals and pharmaceuticals The company's net sales for 1992-93 rose by 33 per cent over the previous year while operating profit increased by 32 6 per cent A sharp rise in interest charges and tax provision however led to a lower rise of 16 4 per cent in profit after tax Despite the rise in profits the company's margins continue to remain low as the products manufactured by it fall under the Drugs (Prices Control)

Order, 1987. It is creating new lines of business (LOBs), namely, production of bulk synthetic chemicals, exports and immuno-diagnostics. While viable processes for two bulk drugs based on in-house R and D are in the final stages of development, the company recently launched 'inras'—an antihypertensive and also commenced production of the bulk drug cyproheptadine. Presently it meets the total national demand for vitamin B-12. Export during the year increased by 64 per cent and the company plans enter the sophisticated user markets of the western world in the near future.

For the year 1993-94 the company expected production to go up following the commissioning of a new sterile manufacturing facility for injectibles in May 1993. Further, it has signed a co-marketing agreement for vaccines with Indian Immunologicals, a unit of National Dairy Development, and a memorandum of understanding with ICI India in the area of veterinary formulations. During 1993-94 the company introduced three new pharmaceutical modules and initiated steps to obtain ISO 9000 certification. In a bid to restructure its capital structure through a better balance between owned and borrowed capital and to reduce the high interest costs, the company entered the capital market with a rights issue of equity shares at a premium of Rs 60 per share in the ratio of one share for every share held. The company's equity capital has doubled following the rights issue while reserves have been strengthened by a hefty Rs 110.5 crore. For the year 1993-94 the company's total income has risen to Rs 77.4 crore while net profit has more than doubled to Rs 2.6 crore. The rise in profit is somewhat due to a decline in operating expenses and interest charges. The company has raised the dividend rate from 27 per cent in 1992-93 to 30 per cent which represents a higher dividend outgo due to the rise in equity capital.

TRI-STAR SOYA PRODUCTS

Technology Upgradation

Tri-Star Soya Products which is engaged in the processing of soyabean and manufacture of refined oil saw a drastic fall in profitability in 1992-93 in spite of achieving a higher capacity utilisation of 67 per cent as against 59 per cent achieved last year. There was a steep decline in the price of finished goods without a corresponding decline in the price of soyabean and consequently, despite a 5.2 per cent rise in net sales, the company's operating and net profits fell by 14.8 per cent and 32 per cent, respectively, over the previous year. Though sale of refined/degummed oil increased by 77 per cent from 3,918 mt last year to 6,937 mt, sale realisation rose only 36 per cent from Rs 12 crore to Rs 16.4 crore over the same period. Sale of crude oil was also lower at 7,023 mt (Rs 16.9 crore) as against 10,460 mt (Rs 30.7 crore) sold last year. The company managed to show a rise in net sales mainly due to the higher realisation on de-oiled cake/powder (which saw a 43.2 per cent rise over the previous year despite a 9 per cent lower sale in volume terms) and a 47 per cent rise in exports which constituted up to 54 per cent of net sales as against 39 per cent in 1991-92.

Meanwhile, in tandem with its strategy to go in for value addition as a process of forward integration, the company has switched over from the production of normal quality soyabean meal to HIPRO quality soyabean meal through technological upgradation. In order to achieve economies of scale the company undertook expansion of its existing soyabean processing capacity from 500 mtpa to 1,000 mtpa in two phases at a total cost of Rs 8 crore. The first phase of the project was expected to commence commercial production in October 1993. In order to cater to the growing demand for texturised soya proteins and its fairly good acceptability in normal diet by all classes of consumers, the company is implementing a Rs 8 crore modern texturised soya protein manufacturing plant in two phases, the first of which was expected to commence operations in January 1994. Further, the first phase of the company's 10,000 mtpa vanaspati manufacturing unit which is being set up at a total outlay of Rs 9 crore, was expected to be operational by April 1994. The company also plans to enter the consumer market for the sale of texturised soya protein, soya flour, vanaspati and refined oil in consumer packs.

For the first half of 1993-94, the company's net sales and net profit stood at Rs 23.7 crore and Rs 0.8 crore, respectively. With its expansion-cum-modernisation programmes expected to become operational in the second half of 1993-94, the company's performance is expected to be better in the latter half of the year.

KESAR ENTERPRISES

Improved Performance

Following a steady decline in net profits over the last three years, Kesar Enterprises has managed to improve its performance in 1992-93, its diamond jubilee year. The company is engaged in the manufacture of sugar through the double sulphination process and alcohol spirits at its sugar factory and distillery in Uttar Pradesh. The modernisation carried out at its sugar factory earlier led to a higher crushing rate of 4,200 tcd in the crushing season of 1992-93 and actual production of sugar rose by 22 per cent over the previous year to 73,303 mt. Sale of sugar was also higher by 24.4 per cent at 67,803 mt as against 54,494 mt sold in the previous year while sale realisation rose by 35.6 per cent due to the higher prices obtained. Production of rectified spirit at the distillery division rose by 50 per cent over 1991-92 to 10,868 kl while that of spiced country liquor rose to 4,206 kl as against 59 kl produced last year. Though production and sale of denatured spirit in volume terms was lower during the year, sale realisation rose by more than 10 times over the previous period. The company's ENA and IMFL plants, after initial difficulties, also commenced production during the year.

On the financial front, while the company's net sales rose by 25.6 per cent in 1992-93, operating profit rose by 64.3 per cent and net profit more than doubled to Rs 2.1 crore. Despite the rise in profits the company's net profit margin remained low at 3 per cent mainly due to the higher interest burden which amounted to 12.4 per cent of net sales. Encouraged by its improved performance the company raised the dividend rate from 21 per cent last year to 26 per cent. The benefits of decontrol of molasses and alcohol by the central government however could not be availed of by the company due to the policy of the state government which banned the export of molasses and alcohol out of the state. The company, which won the Export Promotion Award for the year 1991, saw a 18.4 per cent decline in its alcohol exports to Rs 12.3 crore in 1992-93.

For 1993-94 the company expects crushing to be somewhat less due to the reduction in the area under cane crop nor is the production of alcohol expected to increase significantly. However, the distillery is expected to perform better as the production of country liquor, ENA and IMFL will add to profitability. The government's policy of liberalisation is also expected to give a fillip to imports and exports of bulk liquid chemicals.

Following the conversion of fully convertible debentures in July 1993, the company's equity capital has risen to Rs 6.2 crore. Kesar Marble and Granite, a 100 per cent export-oriented unit and a wholly-owned subsidiary of the company, commenced commercial production in October 1992. Due to certain teething problems and non-availability of electric supply from the state electricity board, however, the company suffered a loss following intermittent and below capacity production for the six months ended March 1993. The company has already exported a few consignments and response to its product quality has reportedly been encouraging. For the first six months of the current year, the company suffered a net loss of Rs 2.1 crore on net sales of Rs 37.3 crore.

Adjustment Programmes and Interest Rate Policy

Arun Ghosh

The policy of imposing high interest rates on a stagnant economy is the direct result of the obsession of the present policy-makers with success in the financial markets rather than in the matter of growth of the real economy.

THE standard IMF prescription for restoring balance to an economy in balance of payments difficulties is two-fold: devalue the currency and tighten up the monetary policy. Currency devaluation is expected to repress import demand and encourage exports. Tight monetary policy is, likewise, expected to reduce investment demand at home and thereby dampen inflationary trends.

It needs hardly to be re-stated that these policies are: (a) typically suited to industrially developed countries, and (b) a strictly monetarist approach to the problem of disequilibrium (between aggregate demand and aggregate supply) in a developed economy.

To these two standard planks of policy, the World Bank has traditionally added a third, and of late a fourth. The structural adjustment of developing countries—which are typically short of capital—calls for raising the price of capital through an increase in interest rates. This is on the premise that the raising of interest rates would promote more labour-intensive methods of production. Finally, of late, the World Bank has added a fourth policy dimension: privatise all economic activities because government is by definition a less efficient economic agent than private enterprise. Needless to say, this philosophy has gained ascendancy only recently, since the 80s, and has got a shot in the arm as a result of the collapse of the socialist regimes in the east European countries.

There are numerous studies on the effect of these programmes, as observed in different countries following the Fund/Bank prescriptions. Quite a few of the studies are highly critical; quite a few others somewhat apologetic. It may be added that most studies relating to the impact of the (externally dictated) adjustment programmes have been undertaken by researchers from within the Fund/Bank; quite a few studies have been made by independent experts (some times commissioned by the Fund or the Bank); and a few by economists from the affected countries. By and large, with a few exceptions, the pursuit of these 'externally dictated' programmes has been found to have accentuated rather than alleviated the economic problems of developing countries.

It is not proposed here to go into the theoretical construct—and the inappropriateness—of these Fund/Bank dictated adjustment programmes. Nor is it necessary to detail the actual experience of different countries pursuing the strategy laid down by the Fund/Bank. The success stories, let it be stated for the record, can be counted on the fingertips. That is neither here nor there. This essay purports to deal with only one aspect of the structural adjustment policies, the problem of interest rates, which is a major element in the programme of adjustment recommended by the IMF/World Bank.

Monetarist Approach

The idea of playing around with interest rates is essentially a part of the 'monetarist approach' to economic management, namely, to control money supply through credit regulation. Nobody would deny that extremely liberal credit could help fuel inflation. But somehow, along the line, Keynes' devastating critique of the interest rate as the regulator of money supply and the mediator of equilibrium between savings and investment has been forgotten. After the experience of the decade of the 70s, when diverse factors made nonsense of Keynesian pump-priming policies in the OECD countries, and when 'stagflation' became the order of the day, the attention of policy-makers got riveted to the need to tame inflation as the first priority.

It is difficult in economic matters to establish clear causal relationships, something easily done in physical sciences, which follow certain immutable laws. The sudden and steep oil price hike of November 1973 had an immediate inflationary impact on the industrialised countries because of their heavy (and increasing) dependence on hydrocarbons as the primary source of energy. It was then that the developed countries of the west woke up to the urgent need for economy in the use of energy for their industrial processes; meanwhile, as a counter to inflation, their simple remedy was a tight monetary policy and deflation. This got reflected in a sudden decline in the demand for primary products, which led to a steep decline in primary product prices and a sharp deterioration in the terms of trade of developing countries (which also felt the effect of rising prices of manufactured products, especially capital goods, following the oil price hike). Thus, the developed (industrialised) countries were able to pass on the cost (to them) of the oil price hike to non-oil-producing developing countries. But that is a separate story, though in a sense linked to the present theme, because the standard recipe for 'adjustment' (in the textbooks of the IMF and the World Bank) was the same for all countries: devalue the currency externally and deflate the currency internally. In fact, since the result was further deterioration in the terms of trade of developing countries, the remedy helped only to accentuate their problems. That, in general, sums up the historical evolution of the 'wrongly directed' adjustment programmes introduced by developing countries generally, at the instance of the IMF/World Bank, in the 70s and the 80s.

We need not go into the evolution of the Reagan-Thatcher policies during the 80s. This essay is not concerned with the successive policy reorientations of the developed countries, which have helped them to aggrandise most of the benefits of trade during the two decades of the 70s and 80s, at the cost of primary producers in the world in general, and in Africa and Latin America in particular. Let us get back to the main theme—the issue of interest rate policy—and relate the same to the extant policies in India.

Under the Fund/Bank economic philosophy, the interest rate plays a crucial role in the 'adjustment' of an economy in disequilibrium. The Fund sees the interest rate as the primary instrument for regulating credit supply, and therefore as the means of taming inflation. In an industrialised country which may be 'overheated'—whatever the reason—this makes sense. But in a developing country, where the basic structural problem is that of low productivity and/or the underemployment of the labour force, the remedy is totally unrelated to the disease; in fact, the doctor is merely prescribing a drug intended to bring down blood pressure to a patient suffering from malnutrition.

Deshmukh's Insight

Years back, in 1935 when the Reserve Bank of India was first constituted, Chintaman Deshmukh introduced what was then known as the 'cheap money' policy,

Notes Dates given in brackets represent dates from which changes in rates have been effected

(1) For deposits for 1 year and above but less than 2 years Deposit rate raised from 8 00 per cent to 8 50 per cent with effect from April 8 1985 Effective April 1 1987 deposit rate raised to 9 00 per cent

(2) For deposits for 2 years and above but less than 3 years Deposit rate for 2 years and above raised to 10 00 per cent with effect from April 1 1987

(3) For deposits for 3 years and above

(4) For deposits for 5 years and above

(5) Depending on the type of facility and period of credit

(6) Figures in brackets indicate lending rates charged to small scale industries

(7) Interest on 'Rights' debentures issued by public limited companies to augment their long term working capital resources was fixed at the rate of 10 50 per cent up to 7 years maturity and 11 00 per cent on the maturity period from 8 to 12 years as per the guidelines issued by the government in September 1978 The ceiling on interest rate on public issue of debentures was raised from 11 00 per cent to 12 00 per cent from October 1980 and further to 13 50 per cent from March 2 1981

(8) While the existing ceiling on interest rate of 13 50 per cent was maintained for issue of convertible debentures the ceiling rate was raised to 15 00 per cent from April 17 1982 in the case of non convertible debentures

(9) The acceptance of deposits for periods more than 3 years has been prohibited with effect from April 1 1978 in terms of the Companies (Acceptance of Deposits) Rules 1975 but companies are permitted to retain such deposits accepted prior to April 1 1978 till maturity

(10) Yield data in respect of ordinary shares from 1984 85 onwards relate to revised series The annual redemption yield is calculated on the assumption that the average price relates to the middle of the period Also see footnotes to Statement 83 Gross Yields on Government and Industrial Securities—All India

(11) Relates to Unit Scheme 1964 proper Reinvestment Plan and Children s Gift Plan

(12) Dividend as percentage of weighted average sale price during the year worked out with weights proportional to the number of units sold at different prices

(13) Raised to 11 85 per cent from July 1 1980 and further to 14 00 per cent with effect from March 2 1981 A two tier interest rate structure was adopted from August 1 1990 The first tier interest rate of 14 per cent per annum was made applicable for an initial period of two years or the construction period of the project, whichever is shorter Thereafter when industrial projects are expected to be in production the second tier interest rate would apply For the second tier, normal rate of interest would be 15 per cent per annum Effective August 16 1991 the interest rates have been made flexible with minimum rate of 15 per cent

Source Reserve Bank of India, *Report on Currency and Finance 1992 93*

the Bank Rate in India being pegged to 3 per cent Chintaman Deshmukh was not an economist he belonged to the Indian Civil Service, but in this farseeing act of his, he proved himself to be a far better economist than the galaxy of Indian economists of post-second world war vintage What was the basic problem of India then? Lack of credit for agriculture, the Indian cultivator being in the clutches of the local money-lender There was also inadequate investment in industry, certainly not in keeping with India's resources The pressing need of the hour was, therefore, to stimulate investment, increase and improve credit supply

Note the dates Keynes' *General Theory* was published in 1936, when Keynes effectively repudiated the classical notion of the interest rate as the best mediator of equilibrium between savings and investment C D Deshmukh's 'cheap money' policy dates back to 1935 What the Indian cultivator required was timely and adequate credit at a reasonable rate What Indian industry required was capital for investment, again at a reasonable rate, so that the incentive to invest were not affected adversely

What is the picture now? In 1980-81, the Bank Rate was 9 per cent In 1990-91—before the crisis of the summer of 1991—the Bank Rate was 10 per cent In 1991-92, the Bank Rate was raised, in two successive steps, to 12 per cent, and the State Bank of India's 'minimum' advance rate (other than for certain designated types of borrowers) from 16 5 per cent to 19 5 per cent

Or, again, let us get back to 1980-81 The minimum lending rate (for commercial banks) prescribed by the RBI was 13 5 per cent in 1980-81 16 per cent in 1990-91, and 19 per cent in 1991-92 The ceiling rate, even for export credit was 11 85 per cent up to July 1, 1980, it had varied between 7 5 per cent and 15 5 per cent, in 1990-91 it shot up to 15 per cent to 24 per cent (All figures taken from the RBI, *Report on Currency and Finance* 1992-93, vol II, p 86) True, the export credit rates have been brought down—in selected cases dramatically—to 3 per cent to 22 per cent in 1992-93, but look at the ceiling rate even for export credit, 22 per cent!

For small industries not able to secure working capital assistance within the narrow limits set for 'lending to the priority sector', effective interest rates today vary from 22 per cent to 25 per cent

Which industry, which small producer, can make a return higher than 25 per cent? If our 'structural adjustment programme' leads to a deep recession in industry, it is because the IMF/World Bank mind-set has permeated into the ministry of finance and the Reserve Bank of India Our economic policy-makers—all of them eminent economists in their own right—have been brainwashed by two intellectually carcinogenic influences 'supply side economics' of Ronald Reagan, and the die-hard, strict monetarism of Milton Friedman (There is now a third insidious—and even more carcinogenic—influence, the policy of 'minimum government' recommended by Friedrich von Hayek, and practised by Margaret Thatcher, but let us leave that aside for the moment Let us focus on interest rate policy)

Let us briefly look at the dimensions of production activity (reflected in net output) and the volume of credit advanced The figures readily available (for 1991-92, in the *Currency and Finance Report* referred to earlier) indicate the following dimensions Agriculture contributed Rs 1,60,860 crore to the GDP (at factor cost) of Rs 5,41,888 crore in 1991-92, or a little under 30 per cent of the national product The contribution of large- and medium-industries was Rs 60,333 crore, or a little more than 11 per cent In other words, agriculture (excluding fishery, forestry, etc) contributed almost three times the contribution of large- and medium-industries to the national product

Total scheduled bank credit to agriculture in 1991-92 was Rs 19,884 crore, to medium- and large-industries was Rs 58,627 crore In other words, the total working capital credit disbursed to agriculture was almost one-third of credit disbursed by the organised financial sector to large- and medium-scale industry Add the advances made to agriculture by co-operatives, Regional Rural Banks (RRBs) and state governments and you have another Rs 6,734 crore advanced to the agriculture sector in 1991-92 You must then reckon the advances made to industry by central term-lending financial institutions (like the IDBI, ICICI, etc) and other agencies (like the UTI, LIC) to the large- and medium-industry sector The amount 'disbursed' by these financial institutions (not including the lending by state financial institutions, which are primarily made to small industries was Rs 15,054 crore in 1991-92 Thus, total development finance (other than from scheduled banks, already reckoned earlier) received by agriculture—employing nearly two-thirds of the workforce—was less than 31 per cent of the total 'development finance' received by the organised industrial sector

The above, however, reflects in a sense the focus of the present administration But the issue we are currently discussing is interest rate policy What is the present structure of interest rates in India? And how do these rates compare with interest rates abroad? What precisely is the effect on Indian production activity as a result? Finally, is it really true that a high interest rate leads to more labour-intensive methods of production, and also increases the rate of saving? Apart from theory, and the experience of other countries, what is our own experience?

Structure of Interest Rates

The Reserve Bank of India (and the ministry of finance) have, of late, claimed a lot of credit for reducing the plethora of interest rates in the country The number of

interest rates in the organised money market has indeed been reduced. But two points need to be added in this connection. First, let us see the present structure of interest rates in India (*vide* RBI, *Report on Currency and Finance*, 1992-93, vol II, see Table 1):

We see from Table 1 that short-term rates, in the organised money market, varied from 3 per cent to 22 per cent even for export credit, while long-term rates varied from 8.50 per cent (for small industries financed by the Small Industries Development Corporation) to 21 per cent for IRBI loans to sick industrial units. (The latter is somewhat strange, considering the IDBI rate for large units varying between 17 per cent and 19 per cent.) Interest rates paid by well-established companies, for term deposits from the public, varied from 12 per cent to 15 per cent.

It is in the above context that the Euroequities (or Global Deposit Receipts) issued by Indian firms abroad become relevant. The interest rates at which these GDRs have been issued by different companies are not known, but one can presume that interest rates around the world being much lower than in India, the borrowing rate from abroad in respect of large Indian companies would be significantly lower than the rates at which short-term working capital funds are available in India.

Even the State Bank of India advance rate is as much as 19 per cent; and now that the RBI prescribes only a 'minimum rate'—which, in general, is 17.0 per cent—and there is no 'ceiling rate', small-scale units have to pay between 22 per cent and 25 per cent to commercial bank, if (and to the extent that) loans are made by banks to small-scale units.

We know that interest rates in the unorganised market, for both agriculture and for industry, vary considerably. Reportedly, in the rural areas of Punjab—a developed part of the country—such interest rates are typically 5 per cent per month (or 60 per cent annually). We know that the borrowing rates of commercial banks vary from 5 per cent on savings accounts to 11 cent on three-year deposits. These are rates at which commercial banks are raising resources from rural areas. And the credit:deposit ratio is quite low in rural areas. Rural savings are being tunnelled by banks to urban areas, and indeed primarily to the metropolitan areas.

In comparison, interest rates abroad vary from 3 per cent to around 8 per cent. For export credits, interest rates are generally quite low. The difference in the interest rate structure must redound adversely on the costs of production in India.

Interest Rates and Capital-Intensity

The World Bank has, over the past many decades, been prescribing a policy of high interest rates in developing countries on the ground that in a capital short economy, we should encourage labour-intensive methods of production, and that the only way to do so would be to raise the price of capital.

There are two basic errors in the above hypothesis. First, since most innovations occur in developed countries, there is a steady worldwide trend towards more capital-intensive production techniques. This is true not only of industry but also of agriculture. The resultant innovative changes make the products manufactured in developed countries cheaper. And those (in developing countries) who wish to compete with such products have to import sophisticated (capital-intensive) equipment from the developed countries. Thus, high interest rates have not prevented the increasing capital-intensity of investments even in developing countries; and indeed, as per the RBI *Report on Currency and Finance*, 1992-93 (vol II, p 17), total employment in large-scale private sector manufacturing declined from 4.67 million in December 1981 to 4.38 million in December 1989 (the latest available), despite significant investment in large-scale industry over these years. Thus, high interest rates have not prevented the influx of capital-intensive methods of production in India.

Secondly, the very logic of high interest rates militates against the widening of the capital base of the economy for improving labour productivity. One could argue in favour of a 'widening' of the capital base before 'deepening' it (in a few sectors). But that does not depend on interest rate policy; it has to be a different, conscious planning decision. This is where the market system fails to deliver. But we need not go into that issue here.

Finally, do high interest rates encourage high savings? From all available empirical evidence around the world, this thesis stands disproved. We need not refer back to Keynes' famous repudiation of this hypothesis, and restate the fundamental linkage between savings and income, as well as on the distribution of income. Even in India, available data on the national accounts (published by the CSO) indicate that savings peaked in 1978-79, when the domestic savings rate exceeded 24 per cent of the GDP. During the 80s, when interest rates have been steadily raised, domestic savings have dipped to a little more than 22 per cent, a decline of something like 2 percentage points over the decade.

It is time to conclude this essay. Economic policy-making in India has, from the mid-80s in particular, depended heavily on the advice of experts from the World Bank/IMF. Of late, economic policy-making under the structural adjustment programme (initiated after July 1991) has been transparently dictated by the Fund/Bank experts. One of the standard IMF recipes for adjustment is the tightening of monetary policy; and a uniformly standard advice of the World Bank to all (capital short) developing economies is to raise the rate of interest.

This advice is not only unsuitable, it is pernicious. It seeks to keep a developing country mired in underdevelopment. Even the argument that a higher interest rate would attract long-term capital inflows is entirely mythical. The inflow of investment capital depends on a host of factors into which we need not delve here. But we must conclude with one comment. The inflow of external capital has been particularly pronounced in India after 1993. The foreign exchange assets of the Reserve Bank of India increased from some $ six billion at the end of March 1993 to $ 15 billion by the end of March 1994 (vide RBI *Weekly Statistical Supplement* to the RBI *Bulletin*, April 9, 1994). This inflow of foreign funds is primarily on two counts: (a) short-term capital to take advantage of the extremely high rate of interest on non-resident deposits in foreign currency, and (b) speculative capital inflow with the express purpose of buying up the highly undervalued assets of public enterprises which are proposed to be disinvested by the government of India, as also for acquiring portfolio investments in blue chip companies, the assets of which are undervalued.

That such capital inflow is not only against the long-term interests of the country, but is in fact tantamount to selling the family property and jewellery for present succour is obvious. That apart, the inherent lack of wisdom in imposing a high interest rate policy on a stagnant economy is a direct result of the obsession of the present policy-makers with success in financial markets rather in the matter of growth of the real economy.

One final word is necessary. Our present policy-makers appear to be believers in shock therapy. A course of strong antibiotics to a patient suffering essentially from malnutrition is never desirable. The objection to high interest rates does not imply that all interest rates should suddenly and precipitately be brought down to levels comparable with, say, Japan. Rather, two steps are necessary. First, a gradual lowering of the interest rate structure. Secondly, and more importantly, putting in place an institutional structure which would make adequate and timely credit available to small farmers, small industries, artisans et al. The ongoing reform of the financial sector is thus wholly misdirected; the reform has to be differently designed and implemented.

Unfortunately, that does not appear to be even part of the agenda of the present government.

COMMENTARY

Debt and Democracy in Brazil

Michel Chossudovsky
Micheline Ladouceur

Under a recent agreement with international creditors on the restructuring of its commercial debt, Brazil will have to put in place reforms which will be a lethal blow to its social programmes which are already in an advanced stage of decay due to successive 'shock therapies'

A HISTORICAL landmark, Brazil was able to meet the 'deadline date' set by her international creditors without the IMF's official stamp of approval On April 15, an agreement was sealed in New York on the 'restructuring' of 49 billion dollars of commercial debt under the Brady Plan The deal had been carefully negotiated by former finance minister Fernando Henrique Cardoso now presidential candidate and Citibank Corp vice-chairman William Rhodes acting on behalf of some 750 international creditor banks The agreement was the culmination of a long drawn-out process, initiated at the height of the impeachment crisis which led to the demise of president Fernando Collor de Mello in 1992 [1]

Major economic and social reforms had been demanded, the IMF had been entrusted with the bureaucratic task of enforcing and monitoring these reforms on behalf of the commercial banks Precise deadline dates had been set for the safe passage of major pieces of 'prescribed' legislation including amendments to the 1988 constitution However despite (former) finance minister Fernando Henrique Cardoso's efforts to manipulate civil society, muster political support and jostle the various reforms through a 'sovereign' parliament, time was running out The March 16 deadline for the signing of a 'letter of intent' with the IMF could not be met A tight schedule, the so-called 'notification deadline' for a deal with the commercial banks' steering committee had been set for March 17

While the April 15 agreement was formally reached against established practice (which requires prior approval of an IMF stand-by loan as collateral for the debt restructuring programme), the economic reforms were, nonetheless, considered "to be on track" IMF managing director Michel Camdessus said that he was impressed with steps already taken and promised to co-operate closely with the government In turn, finance minister Fernando Henrique Cardoso stated that the IMF's promise of further co-operation" (once key elements of the economic programme are in place) should be enough for the debt restructuring deal to go ahead Despite 'unfortunate delays' in the parliamentary process, the main condition—requiring a massive release of state financial resources in favour of the creditors—had been met the legislature had approved the IMF's fiscal reforms including the creation of a 'social emergency fund' (on the World Bank model) The vote in congress (requiring a constitutional amendment) obliged the government to slash the federal budget (including public investment) by 43 per cent while redirecting state revenue towards debt servicing

The measures imposed by the creditors constituted a final lethal blow to Brazil s social programmes, already in an advanced stage of decay as a result of successive shock therapies' The social emergency fund (SEF) is in fact to be "financed from the budget cuts" (implying transfers of funds to the SEF) through the concurrent phasing out of regular government programmes and the massive dismissal of government employees Its inauguration represents an important political landmark sovereignty in social policy is foregone, henceforth budgets and organisational structures will be directly monitored by the Washington-based Bretton Woods institutions acting on behalf of the international creditor banks The collapse and destruction of the state's social programmes and the phasing out of part of the government pension plan (Previdencia Social) were pre-conditions' 'for the signing of the agreement Moreover, the reforms also engineered a squeeze of real wages by establishing 'a salary ceiling' in the public sector,' as well as the 'switching' of all wage contracts into a new currency unit, the URV (real unit of value) (initially operating as an accounting unit) The latter reform, requiring a separate piece of legislation, had been worked out well in advance (in high level meetings behind closed doors) in close consultation with the Washington-based bureaucracy Winston Fritsch, secretary of state in charge of economic policy had inadvertently leaked to the press in October 1993 that he would 'deliver to the IMF, the skeleton of a plan of deindexation" (quoted in *Folha de Sao Paolo*, March 3, 1994, pp 1-10)

The IMF's 'economic therapy' also redefines in a fundamental way the relationship between the central and regional governments entrenched in the 1988 constitution The proposed 'model' of fiscal reform is in this regard analogous to that imposed by the international creditors on the Yugoslav Federation in the late 1980s (prior to its collapse) federal transfers to state and municipal governments earmarked for health, education and housing will be frozen, the regions are to become 'fiscally autonomous', the savings accruing to the federal treasury will be redirected towards interest payments

It is worth mentioning that the macro-economic reforms are carried out "in the name of poverty alleviation" the "Citizens' campaign against famine" ('*Acao da Cidadania contra a Fome a Miseria e pela Vida* ') initially established by the opposition Workers Party (PT) in the last months of the Collor de Mello administration, now provides the government with the necessary ideological backbone as well as a populist mouthpiece The campaign has lost its original momentum as a broad democratic grass roots movement directed against the policies of the state After president Collor's impeachment by the Senate in September 1992, the Workers Party agreed with the new government of president Itamar Franco to broaden the social and political base of the campaign A deal was struck between the leader of the campaign Herberto de Souza ('Betinho') of the Workers Party and Alcyr Callian, president of the Bank of Brazil The Bank of Brazil (a powerful financial arm of the central state) was entrusted with setting up local campaign committees throughout the country At present, more than two-thirds of these grass roots committees are controlled by employees of the Bank of Brazil (*see Veja*, Rio de Janeiro, December 1993) In turn, the powerful business tycoon Roberto Marinho who controls the 'Globo' television network offered to grant free Hollywood-style commercials to the campaign during prime TV time . Poverty and famine are portrayed in a stylised tabloid form in the Brazilian press, with funding in the hands of the financial elites, no pervasive linkage is made between the IMF's 'economic

medicine' and the occurrence of famine. As the economic crisis deepens, the 'citizens' campaign' serves the 'useful' purpose of diverting attention from the real policy issues; it seeks a broad national consensus, avoids controversy and refrains from directly indicting either the government or Brazil's privileged social elites...

The campaign against famine also serves another related function: the main 'poverty indicators' put forth by the campaign are based on the 'estimates' of the government's official 'economic think tank', the Institute of Applied Economic Research (IPEA) now entrusted with supportive 'research' on famine and poverty. Grossly manipulated and falsified, IPEA's 'estimates' suggest that a mere 21 per cent of the Brazilian population is situated below the 'critical poverty' line.[3] Double standards: 32 million people in Brazil against 35.7 million in the US (according to the definition of the US government). In other words, the campaign portrays poverty as pertaining essentially to a 'social minority' thereby vindicating the World Bank's framework of 'selective' "targeting in favour of the poor". It not only distorts but tacitly denies the obvious (amply confirmed by official statistics), namely, that most sectors of society including the middle classes are being impoverished as a result of the economic reforms adopted since the outset of the Collor government.[4] Macro-economic policy has accelerated the 'expulsion' of landless peasants from the countryside leading to the formation of a nomadic migrant labour force moving from one metropolitan area to another... In the cities an entirely new "layer of urban poverty" (socially distinct from that which characterises the 'favelas') has unfolded: thousands of salaried workers and white collar employees hitherto occupying middle and lower class residential areas have been evicted, socially marginalised and often 'excluded' from the slum areas.

Management of Poverty

The SEF requires a 'social engineering', a policy framework for 'managing poverty' and attenuating social unrest at minimal cost to the creditors. So-called 'targeted programmes' earmarked "to help the poor" combined with 'cost recovery' and the 'privatisation' of health and educational services are said to constitute "a more efficient" way of delivering social programmes. Concurrently, the National Institute of Social Security (INSS) is to become increasingly 'self-financing' by substantially raising its premium-contributions from both urban and rural workers...[5] Many programmes under the jurisdiction of line ministries will henceforth be managed by the organisations of civil society under the umbrella of the SEF. The latter will also finance "a social safety net" (in the form of severance payments) earmarked for public sector workers laid off as a result of the constitutional reform process...

The SEF officially sanctions the withdrawal of the state from the social sectors (a process which in any event is already ongoing), and "the management of poverty" (at the micro-social level) by separate and parallel organisational structures. Since the outset of the Collor government, various non-governmental organisations (NGOs) funded by international 'aid programmes' have gradually taken over many of the functions of the municipal governments whose funds have been frozen as a result of the structural adjustment programme. Small-scale production and handicraft projects, subcontracting for export processing firms, community-based training and emplo-ment programmes, etc, are set up under the umbrella of the "social safety net". A meagre survival to local-level communities is ensured while at the same time containing the risk of social upheaval. An example of "micro-level management of poverty" is in Pirambu, a sprawling slum area of 2,50,000 inhabitants in the north-eastern city of Fortaleza. Pirambu is literally 'carved up', each slice of the urban space is under the supervision of a separate international aid or non-governmental organisation. In the Couto Fernandes neighbourhood of Pirambu, the German Aid Agency GTZ supports the establishment of a model of 'community management' (interviews conducted in Pirambu, Fortaleza, July 1993). This 'micro-democracy' installed under the watchful eye of the donor community also serves the purpose of subduing the development of independent grass roots social movements. German funding will finance the salaries of the expatriate experts whereas the investment funds earmarked for small-scale manufacturing will be 'self-financed' through a 'revolving fund' managed by the local community.

The "management of poverty" in rural areas serves the same broad objectives: to subdue the peasant movement on behalf of Brazil's powerful landowning class while ensuring a meagre survival to millions of landless peasants uprooted and displaced by large-scale agri-business. In the north-eastern Sertao, for instance, a region affected by recurrent drought, a minimum works programme (*"frentes de trabalho"*) provides employment (at 14 dollars a month) to some 1.2 million landless farm workers (1993) (interviews with farm workers in the region of Monsenhor Tabosa, Ceara, July 1993). The latter, however, are often hired by the large landowners at the expense of the federal government. The distribution of US grain surpluses financed under PL 480 to impoverished farmers (through government and relief agencies) also serves the related purpose of weakening local level food agriculture and up-rooting the small peasantry. The food distribution programmes are adopted in the name of the "Citizens' Campaign against Famine"...

The expropriation of peasant lands is an integral part of the IMF-World Bank structural adjustment programme. In this context, the National Institute for Colonisation and Agrarian Reform (INCRA) among several government agencies oversees "the rural safety net" through token land distribution programmes and the development of co-operatives for the 'posseiros' (landless farmers). These schemes are invariably established in marginal or semi-arid lands which do not encroach upon the interests of the landowning class. In the states of Para, Amazonas and Maranhao, several international donors including the World Bank and the Japanese Aid Agency (JICA) finance (through INCRA) so-called "areas of colonisation".[6] The latter largely serve as 'labour reserves' for large-scale plantations. It is worth mentioning that the proposed constitutional amendments also imply the *de facto* derogation of customary land rights of the indigenous people, a process which is already under way with the transformation (under the jurisdiction of INCRA) of the 'Indian reserves' in the Amazon into areas of settlement for plantation workers.[7]

NARMADA PROJECT

Pro-Dam Groups Obstruct Officials

Bina Srinivasan

The recent incident of pro-dam groups trying to obstruct the movements of the commissioner of scheduled castes and tribes is yet another indication of the scant respect these forces have for democratic norms.

ON June 2, Ram Dhan, commissioner, National Commission for SC-ST, was travelling to Manibeli with his secretary and B D Sharma, former commissioner. The purpose of the visit was reportedly to look into the grievances of the adivasi families of the Narmada valley to be affected by the Sardar Sarovar Project. On the way, his vehicle was stopped at Dewalia Chowkdi by a group of people who demanded that he turn back and return to Baroda. Their argument was that he would have to first meet the people of Gujarat. The commissioner who was apparently determined to go to Manibeli managed to move on. At Garudeshwar they were stopped again by a crowd which resorted to stone-throwing. The SDM Bharuch tried to persuade Ram Dhan to return by pleading that the situation could go out of hand, that he could be forced to give orders to the police to fire at the irate crowd. The commissioner himself moved out of the vehicle and sat on the road in protest. They tried to attack him physically, he alleged. The combined efforts of the police and the mob had him back in the vehicle and he had to return to Baroda.

At the Narmada guest house in Baroda, he sat on a dharna right at the entrance, in protest against what he termed unconstitutional efforts on the part of the pro-dam lobbyists to prevent him from carrying out his duties. A group of about 25-30 people, claiming to represent the tribals and farmers of Gujarat including Suren Choksi, an industrialist, Rajendra Rathod, ex-mayor, Baroda and others gathered aroumd Ram Dhan. Amid slogan-shouting they told the SC-ST commissioner that they had no problems with him, it was B D Sharma they were objecting to. They accused the former commissioner of being a foreign agent, of taking foreign money and trying to sabotage the development of Gujarat. He was corrupt, they said, and anti-national to boot. They said to Ram Dhan, you are a freedom fighter and we do not expect you to behave like a bureaucrat. You must listen to us, we are the majority. You cannot give credence to minority opinion.

Ram Dhan refused to entertain anybody. He said that he was not willing to listen to anybody in this fashion. I had come here expecting to talk to people, instead I was attacked, he said. He also called the people gathered there at the Narmada guest house black marketeers. At this the crowd proclaimed that he had insulted them. It is like being said that we are an effeminate, emasculated lot, they said, using the Gujarati word 'baila'. The commissioner was then besieged by the deputy commissioner of police and the collector, Baroda. They tried to persuade him to move indoors. Ram Dhan had decided that the intervention of a person no less than the CM Chabildas Mehta would serve to end his dharna. In the meantime, B D Sharma was whisked away to the Circuit House (government guest house) under police escort. As he was getting into the police vehicle, one of the onlookers grabbed at his spectacles.

I was present at the Narmada guest house, wanting to cover the event. As B D Sharma left, the crowd turned to me. Who are you, they demanded to know. I explained that I was there as a free lance journalist. We do not know you, they replied. She is an anti-dam activist, one of the Medha Patker's people, they said to the police. I had seen her address a public meeting in Delhi under the NBA banner, one of them said. The entire crowd took up the chant. They had all seen me address various public meetings in Delhi! (needless to say, I have never addressed a public meeting in Delhi for NBA or otherwise). They wanted me out from there. The police and the collector now joined in, asking me to move away as it was not safe. Not satisfied with verbal assault, they tore off the seat of my scooter, removed the rear-view mirror. A police complaint was later filed against them. Ram Dhan ended his dharna late in the evening after telephonic contact was made with the CM Chabildas Mehta.The day-long drama finally ended bringing in its wake a few pertinent questions.

In Gujarat, the state has identified itself with SSP and all those who defend it in the name of development and modernisation. As a result, Ram Dhan as also part of the state, introduced a certain twist to the scenario where normally anti-dam activists are ranged against the pro-dam forces who enjoy state support. So it would seem that on June 2 the state was pitted against itself. In defining his constitutional duty as one that made it obligatory for him to meet the adivasis of the Narmada valley, he clashed with those elements of the state who could not afford to either let him proceed or let him [illegible] to any harm. So while the Baroda collector seemed hard put to ensure his safety, it was also amply clear that the pro-dam forces were being given a wide margin to threaten, bulldoze and 'persuade' Ram Dhan to return to Delhi. A similar conflicting situation had arisen within the state with regard to the review team that had been announced by Kamal Nath, the environment minister. While it is true that there are elements within the state that wish to ensure that constitutional rights and duties be translated into reality with all sincerity, it seems hard not to characterise the state in an overall sense, as anything but coercive. The modern India state has in no uncertain terms aligned itself with the propertied minority of the country. Indeed, it does seem as though the state has been created to serve their interests. There can therefore be no doubt about the direction of its policies and development paradigms. This is not to deny conflicts within various agencies/components of the state or between the long-term and the short-term goals of the state. But even these conflicts in the ultimate analysis are used to further legitimise the role of the state in controlling the lives of the people.

As regard democratic practice, 'rasta rokos' and 'gheraos' are without doubt part of the baggage of democratic tradition. But in this instance, it is noteworthy that the pro-dam forces, the self-appointed majority of Gujarat are, to put it plainly, the rich sections of the Gujarati society. There are, of course, those who are convinced about project of modernisation and for whom the Gujarati identity is synonymous with development—industrialisation (because of which SSP symbolises the greatest achievements of Gujarat). But the more vocal, the more visible are the rich farmers, the industrialists and those who have a stake in the current political scenario. Both pro-and anti-dam forces have the right to take recourse to democratic means to press home their view-points. But contexts vary drastically in each case. The anti-dam movement has made visible the articulation and aspirations of the under-privileged, who have been repeatedly made to pay the price of 'progress'. The pro-dam forces have, on the other hand, shown scant respect for democratic norms and have used such protests to wage an open war against the have nots, to underscore the state support they enjoy and the economic and political clout they wield. That is where the subversion begins. To end with the attempt to obstruct even official channel available to the poor. All of which pose grave questions for those concerned with social justice.

Outlawing Oral Divorce

Reform through Court Decree?

K G Kannabiran

The Allahabad High Court judgment on triple talaq not only trivialises the justice system but attempts reform of a minority community's personal laws—a responsibility it cannot arrogate to itself Such reform can only come about through consensus within the community.

THE judge, a non-elected person sometimes has to play the role of a legislator His independence is assured to him so that he may with a sense of detachment look at issues arising before him in an objective manner and in the assessment ensure that the process of arriving at a decision is equally fair Implied in 'fairness' is also a sense of propriety, an obligation to deal equally with all minority communities who live under the Constitution The independence granted to the judges and judiciary is not to be used in a wreckless and irresponsible manner The sentinel on the Quivive cannot turn himself into a bandit on the highway Nothing the court or judge says or does should savour of prejudice, whim or fitfulness Whatever changes are to be brought about in society by the judiciary have to be done without violently rending the custom or tradition asunder They cannot assume that they have the authority to grant special leave to start an Indian revolution[1] This is more so where there are minorities who are living under threat and are likely to cling to what we consider their outmoded and out of date customs and rules which govern their personal laws as an assertion of their identity

Look at the Tilhari judgment By outlawing oral divorce he has left the Muslim male without any way of getting a divorce As a judgment the effect it is likely to have on earlier oral divorces has not been taken into reckoning The woman in question lost her one unit of land to which she would be entitled if the divorce had been upheld The husband's share cannot be declared as surplus under the present dispensation Above all the judgment trivialised the justice system by gross impropriety The issue of divorce was not directly before the judge at all There have been many Hindus who produced collusive decrees of divorce for saving properties from the land reform laws In none of these cases has the constitutional validity of forms of divorce prevailing in the personal laws been questioned

Judge Tilhari like many Hindus feels that Muslims are backward and they need to be reformed While the first may be true it is not judges from the Hindu community who are competent to bring about this change We must not forget that reforms within the Hindu community were brought about by the social reform movements within the Hindu faith To have a proper perspective on issues like these, some history of codifying Hindu law the resultant laws and their secular character and the judicial policy and its breach needs to be examined

Codification of Hindu Law

The Hindu Widow s Remarriage Act 1856 removed the disabilities imposed on widows on remarriage The Hindu Inheritance (Removal of Disabilities) Act, 1928 was passed to remove the disabilities to inheritance based on disease deformity or certain types of mental or physical defects The Women's Right to Property Act, 1937 improved to some extent the position of the Hindu women in the matter of succession All these legislative interventions were made after deliberation with and within the Hindu community By 1941 several amendments to women's right to property were pending consideration The government of India by a resolution dated January 25 1941 appointed a committee consisting of B N Rau as the chairman and Dwarkanath Mitter, J R Gharpure, Rajaratna Vasudeo Vinayak Joshi as members and their brief was to examine the various bills to amend the Hindu Women's Right to Property Act and to suggest such amendments as would resolve doubts and remove any injustice that may have been done by the act to the daughter They were also to examine and advise on the amendment to Hindu Law of Inheritance, a bill promoted by K Santhanam and Hindu Women s Right to Separate Residence and Maintenance Bill introduced by G V Deshmukh All amendments were introduced by Hindu members of the central legislature

The committee examined the question and was of the opinion that the varied schools and systems of Hindu law need study and an attempt should be made to codify Hindu law The two draft bills on inheritance and marriage were however introduced and they were referred to a joint committee The report of the joint committee suggested that Hindu Law Committee chaired by justice B N Rau be resuscitated and encouraged to complete the task of bringing about a comprehensive Hindu Code as suggested by them Accordingly by resolution dated January 20, 1994 the Hindu Law Committee was revived T R Venkatrama Sastri was included in the place of R V V Joshi that being the only change

This committee set about its work in right earnest and prepared a draft code with an explanatory note and published it on August 5 1944 The explanatory statement said "one of the objects of the Committee is to evolve a uniform Civil Code of Hindu Law which will apply to all Hindus by blending the most progressive elements in the various schools of law which prevail in the different parts of the country The achievement of uniformity necessarily involves the adoption of one view in preference to others on particular matters The committee desire that the code should be regarded as an integral whole, and that no part should be judged as if it stood by itself"

The Hindu Law Committee travelled all over the country meeting with a cross section of the people recording their views and minuting the discussions and the final draft was ready by February 1947 The bill was introduced in the constituent assembly (legislative) which in turn referred it to the select committee in 1948 B R Ambedkar the then law minister formed a committee consisting of himself as chairman, K Y Bhandarkar G R Rajagopal of the ministry of law and S V Gupte of the Bombay bar to examine the draft The committee revised the bill without making substantial changes Before the bill came up for consideration before the constituent assembly (legislative) the publicity it received gave rise to a lot of controversy among the members of the public There was a cry of religion being in danger Ambedkar the democrat he was convened a conference in 1950 to which he invited scholars well read persons and pundits from Benares and other places to canvas support for the steps initiated towards codifying the Hindu law He held another conference at Trivandrum to consider whether the Marumakathayam and Aliyasanthana laws could be made part of the proposed Hindu Code Despite all these efforts the draft code met with rough weather when it came up for consideration in the assembly on February 5, 1951 The passage was blocked by amendments galore The debate which was inconclusive was taken up in September 1951 The differences could not be ironed out After the 1952 elections the provisional parliament lapsed and regular parliament came into existence and the Hindu Code Bill lapsed It was followed by the four piecemeal legislation codifying certain areas of Hindu law

As an aside it would be interesting to know the reasons for opposing equal rights to women in property

(a) She always gets a substantial share in the family property in the shape of jewellery

and as dowry at the time of her marriage;

(b) it will introduce a stranger into the family, i.e. the son-in-law and this is very undesirable;

(c) it will lead to friction between the brother and the sister;

(d) it will lead to further fragmentation of the estate;

(e) as her affections are transferred to her husband's family it is not desirable to give her a share in her father's property.

The committee set up in 1941 continued its work till 1948; the Draft Hindu Code was pending in the central legislature, the constituent assembly (legislative) and finally lapsed in 1952 after the first Lok Sabha came into existence. During the pendency of the code what is worth noting is the anxiety of the persons concerned particularly Ambedkar for securing a consensus on the necessity for a Hindu Code Bill. Even the introduction of a clause prohibiting bigamy was opposed. The reaction as recorded by history—the prolonged deliberation, the publicising of the proposals, the convening of conferences of scholars—all these indicate the respect for the feelings of the concerned and above all the understanding they had of the nature and character of what goes by the name of personal law and the hold these rules of personal and domestic relationship have on the people, that are governed by these rules. These rules have been seen as part of religion. This also illustrates the difficulties faced in bringing about even a uniform Hindu Code to govern a professedly homogeneous community.

The four acts which were piloted with skill by Pataskar and are governing Hindus today are they secular at all or are they basically Hindu? Can they be then pronounced unconstitutional?

Unconstitutional?

Under the Hindu Marriage Act, 1956 conversion from Hindu religion immediately provides a ground for divorce for the other spouse. The question of reconciliation during the pendency of proceeding as a step to avert divorce is of no avail and judicial separation as an interim measure to enable the separated couples to rethink their stand and come together is not available either. Difference in religion creates incompatibility and the statutory provision encouraging divorce is both anti secular and is in derogation of Article 25.

Under the Hindu Adoption and Maintenance Act one must be a Hindu to be able to adopt and the person capable of being adopted should also be a Hindu. Thus the principle that persons belonging to two religions can live together is not even tolerated.

Under the Hindu Minority and Guardianship Act ceasing to be a Hindu deprives either spouse to claim guardianship over the children. The law of succession though it does not deprive right to succession to a convert, the children and the descendants of the convert are denied the right to succeed to the property of the Hindu relative unless such children or descendants are Hindu when succession opens.

These are certainly not secular nor do they permit all the freedom of religion which Article 25 visualises. It is well to recognise that whatever improvements we have consented to is within the Hindu framework. In fact the community has progressed so much that it is possible now for both the spouses to secure a divorce on the ground that the marriage has irretrievably broken down. All these measures were brought about because of the compulsions of modern life. These were brought about by the Hindu majority and not at the suggestions of any outside community. No other community from outside tried to influence the course of reform within the Hindu community.

Courts have not till now struck down any provision or rule either enacted or otherwise in any personal law. In the first few years of the Constitution the state enactments prohibiting bigamy came in for challenge in some state high courts. One such case came up in the Bombay High Court when Chagla was the chief justice. The Bombay Prevention of Bigamous Marriages Act was under challenge. The argument was that a son is an absolute necessity if a Hindu is to attain salvation and that therefore polygamy was an integral part of the Hindu religion; one becomes polygamous in pursuit of a son and not for any other reason. Secondly, only the Hindu community has been picked up for this discriminatory treatment and the Muslims are left free to practise polygamy. "It is only with considerable amount of hesitation that I would like to speak about Hindu religion", that is how he began the discussion on the questions raised.

On the issue of discrimination Chagla held, "The institution of marriage is differently looked upon by the Hindus and the Muslims. Whereas to the former it is a sacrament, to the latter it is a matter of contract. That is also the reason why the question of dissolution of marriage is differently tackled. While Muslim law admits of easy divorce, Hindu marriage is considered indissoluble and it is only recently that the state passed legislation permitting divorce among Hindus. The state was also entitled to consider the educational development of two communities. One community might be prepared to accept and work for social reform, another may not be yet prepared for it; and Article 14 does not lay down that any legislation that the state may embark upon must be of an all embracing character. The state may bring about legislation by stages and the stages may be territorial or they may be communitywise." Gajendragadkar who was later to be the chief justice of India articulated more or less the opinion of Chagla and both of them held that personal laws do not come within the meaning of 'laws inforce' under Article 13(1) of the Constitution. The view that personal laws of communities are beyond the pale of the Constitution has been holding the field at the apex level from the beginning of the Constitution.

The Supreme Court towards the end of 1979 had before it the question whether the high court was right in holding "that the strict rule enjoined by the *Smriti* writers as a result of which sudras were considered to be incapable of entering the order of 'yati' or 'sanyasi' has ceased to be valid because of the fundamental rights guaranteed under part III of the Constitution.

The learned judges of the Supreme Court overruled the principle referred to above. In their opinion the learned judge of the high court failed to appreciate that part III of the Constitution does not touch upon the personal laws of the parties. In applying the personal laws of the parties, he could not introduce his own concepts of modern times but should have enforced the law as derived from recognised and authoritative sources of Hindu Law, i e, *Smritis* and commentaries referred to, as interpreted by various high courts, except where such law is altered by any usage or custom or is modified or abrogated by statute. Abrogating personal laws was never considered as falling within the jurisdiction of the court. It was always felt that scriptures and religious texts are not subject to judicial review.

Shah Banu interpreted Quran and that became objectionable. Shah Banu came up for hearing at a time the major minority community was already under threat. At the time of arguments the stand of the government on the question of Muslim personal law as expressed in the parliament by Ram Niwas Mirdha, the then minister of state for home affairs, was brought to the notice of the judges. The debate was on the provisions of Cr PC 1973. He said "We would not like to interfere with the customary law of Muslims through the Criminal Procedure Code. If there is a demand for change in the Muslim personal law, it should actually come from the Muslim community itself and we should wait for the Muslim public opinion on these matters to crystallise before we try to change this customary right or make changes in their personal law."

When this part of the debate was brought to the notice of the court the response was:

> We understand the difficulties involved in bringing persons of different faiths and persuasions on a common platform. But, a beginning has to be made if the Constitution is to have any meaning. Inevitably the role of the reformer has to be assumed by the courts because it is beyond endurance of sensitive minds to allow injustice to be suffered when it is so palpable.

No person who has some acquaintance with the principles and practice of democracy would assign the role of a reformer to a judge. One may not have serious differences with the end result but that cannot be permitted to be secured by perverse means.

More than interpreting Quran the judges should have indicated their understanding of what they mean by a uniform civil code. When we are talking of a uniform civil code it is necessary to define our terms. By uniform civil code do we mean similar but different statutes covering the field now covered by the personal laws of the respective minorities? Or is it a common civil code where all the communities will forgo their religious and ethnic identities and will be governed by one statute covering all the personal laws? Are all these going to be achieved by a democratic process of working out a consensus? Or is it going to be statutorily imposed? Or is it going to be judicially declared?

When we talk about reform we ordinarily understand it as an act of transformation for the better. The old, the outdated is replaced by a new one. The reformer has to delineate the alternative, etc, for people to understand what the alternative is like. This effort should lead to a public debate. The court has neither the equipment nor is it suited to don the reformist role. Thus when the Supreme Court donned the reformist role it ended up by pitting the Code of Criminal Procedure against the Quran and interpreted Quran in terms of the Criminal Procedure Code. This was objectionable. Judge Tilhari's approach is no better. Like the Queen in *Alice in Wonderland* with one stroke he seems to have struck down Sha'riat Act, 1937 and the oral talaq.

All of us agree that we should abolish the caste system which has given rise to almost all the problems we are facing today. There was an excellent occasion to deal with this question squarely in the Reservations case (Indira Sawhney vs Union of India). In fact there is an elaborate discussion on the evils of caste system and the periodical revolts against it throughout history. The Supreme Court could have declared the caste system as wholly invalid. After all sensitive minds should be equally uneasy of the iniquities and the injustices perpetuated by the caste system. There could not have been a better occasion for the court to don the reformer's role. But till now the caste question was never addressed in terms of the Constitution by the courts.

The debates in the Constituent Assembly inform us of the apprehension of the minority communities and dalits at the time when the Constitution was on the anvil and the assurance extended by the leaders of the majority community. Secularism and politics of a secular nature were assured to the members. We were all for a secular polity. Implied in the term secularism is not just a legal commitment to formal equality, it also recognises the claim of religious and other minorities to a right to equality. It is a right to be treated as an equal in all respects with the majority community including with regard to share in the power structure. This equality in content wholly receded to the background. The majority community has assumed the role of a dominant community, a conqueror's role.

The minority's resistance to reform and a reluctance to change its outmoded ways has to be seen as a symbol of resistance to the dominant culture. The increasing number of Muslim youth rushing with skull caps on into the mosque morning, noon and evening appears is more like a political statement of a community under threat than a mere growth of fundamentalism. The latter may very well be the means by which the community has decided to fight the dominant culture's design to override the minority and its identity. It is the vindication of their right to be different and a visible expression of their otherness. In the present climate a few more judgments like judge Tilhari's may lead to situations which may well become irretrievable. Some may welcome such decisions on the ground that it is, after all, just. As Cordozo puts it so well "That might result in benevolent despotism if the judges were benevolent men. It would put an end to the reign of law."

Karnataka Cabinet Reshuffle: Unviable

Ambrose Pinto

The cabinet reshuffle by Veerappa Moily was a political rather than an administrative exercise.

DISSIDENT activities that have characterised the Congress Party in Karnataka did subside somewhat after the implementation of the Jagannath Mishra plan of January 1994. Mishra met the various dissident factions and promised them a share of the cake of power. As a first step to curb the dissident activity, Rajshekar Murthy, the leader of the powerful Lingayat faction and a contender for the post of chief minister, was promoted to become an MP through the Rajya Sabha. S M Krishna, the leader of the Vokkaliga faction, was continued as deputy chief minister in spite of the wranglings between him and the chief minister. The leaders of both the dominant castes were assured that their followers would be provided sufficient amount of places in the ministerial reshuffle. Hence when Veerappa Moily announced his 46-member ministry on April 14, the largest the state has ever had, it was perceived as a political rather than an administrative exercise.

One out of every five Congress(I) members in both the houses have found a berth in the cabinet. Out of 210 members in the legislature (180 in the assembly and 30 in the council), 46 have become ministers. The representatives of Rajshekar Murthy, S M Krishna and the KPCC president Krishna Rao factions have been accommodated with a view to satisfy the dissidents. The chief minister has claimed that the ministry is representative of all castes and regions of the state.

Caste groups are well-represented. The two dominant groups of Lingayats and Vokkaligas have received more than what they had bargained for. There are six Lingayats and eight Vokkaligas in the ministry. The brahmins have two representatives. In the panchayat elections a sizeable number of SCs had abandoned the Congress to join the Janata Dal. To win them over to the Congress, six SC and three ST members have been inducted into the ministry. Bangarappa, ex-chief minister of Karnataka and president of Karnataka Congress Party, through his massive public rallies, has made inroads into the traditional Congress votes of the BCs. Twelve members of the BCs have been accommodated in the ministry by Moily to counteract the influence of Bangarappa. There are two Reddys, one Bunt, three Muslims, one Kodava and one Christian in the ministry. The speaker belongs to the Lingayat community while the deputy speaker comes from a scheduled caste.

The chief minister has observed that all districts have been given representation. His own district of South Kanara has been favoured with five ministers. There are four ministers each from Gulbarga, Bangalore (city) and Bangalore (rural). While there are three ministers each from Chitradurga, Tumkur, Mandya and Dharwad, Bijapur, Kolar, Hassan. Kodagu and Chikmagalur have two representatives each. Districts of Mysore, Uttara Kannada, Shimoga, Bidar, Raichur, Bellary and Belgaum are represented by one person each. Moily is expected to accommodate the other legislators to various boards and corporations as chairpersons.

The cabinet has two controversial ministers "Anyone under cloud should not continue in the cabinet", Moily had observed when S Ramesh, the minister for culture, was forced to resign from the Bangarappa cabinet for his involvement in the firing at Kunigal during the by-election of Karnataka assembly in which one person was killed and three were injured. Moily had also ordered an inquiry against Ramesh for his alleged involvement in land-grabbing under the Ashraya programme. Surprisingly, Ramesh

has found a berth in Moily's cabinet. A Bangarappa supporter, Ramesh has conveniently changed his loyalty to Moily.

So has Kagodu Thimmappa. Soon after assuming office as chief minister, Moily had ordered an inquiry against him to investigate the charges of misappropriation of funds amounting to Rs 15 crore under the Ashraya programme. The inquiry has not yet completed its work. Yet Thimmappa finds a place in the ministry.

Neither the loyalists nor the dissidents wanted these men in the cabinet. How did they then find a place? Ramesh is perceived to be the leader of the brahmin community. The Brahmana Mahasabha in a recent statement had requested the entire community to back him. The man has the backing of some bigwigs in Delhi too. On the other hand, the decision to induct Thimmappa is to counter the Bangarappa's influence on the electorate. Thimmappa hails from the same district as Bangarappa and belongs to the Idiga community of the latter.

The ministry has been criticised for its size by all sections of political parties and the public. Moily might say that the Constitution does not mention about the size of ministry. However, the Administrative Reforms Commission has regarded 10 per cent of the total membership of the assembly as an ideal size. Accordingly, a ministry of 25 should have been ideal for Karnataka. Deve Gowda, the state Janata Dal president, commented on the pathetic state of helplessness of the chief minister. "Never before in the country", he said, "has a chief minister been rendered so helpless by AICC president by not allowing him to execute responsibility independently". Deshpande, the leader of the opposition in the assembly, described the ministry as "elephant-sized" and "worth nothing". He found it unfortunate that at a time of severe financial crisis through which the state was passing, such a big ministry had to be constituted at the expense of the common man. Bangarappa lashed out at the Congress president, Narasimha Rao, for allowing the biggest ever ministry in Karnataka. State president of BJP's farmers' wing criticised the induction of Ramesh and Thimmappa.

More vociferous were some of the Congress MPs very close to the chief minister. Both Hari Prasad and Chandraprabha Urs, a source of strength to Moily during the attack on him by the dissidents, felt that the party's reputation had suffered by Moily's induction of legislators facing various charges. Hari Prasad openly declared that it had been a blunder on his part that he had supported Moily at one time. The union railway minister Sharief expressed his dissatisfaction at the 'airbus ministry'. Subbaiaha, a Congress MLA, discovering that criminals had found a place in the ministry threatened to canvas against the Congress in the November elections to the legislature. The Moily loyalists are upset over the inclusion of some persons and the exclusion of some others. The dissident core group is so dissatisfied that they seem to be on the verge of divorcing their leaders—Rajshekar Murthy, S M Krishna and Krishna Rao.

The ministry was, no doubt, constituted with the coming polls in mind. Moily was perceived as an honest politician in spite of his inability to translate his pronouncements into action. But with the reconstitution of the ministry the clean image that he enjoyed has been sullied.

The ministry may not charm the public into voting the Congress back into power. With the induction of Ramesh, Thimmappa and a few other legislators with unfavourable past records, the tarnished image of the Congress has suffered even further.

It is true that the ministry is not of Moily's making. But can a chief minister abdicate his responsibility to provide a clean and efficient government to the people of a state? Further, it raises the question of the powers the prime minister has arrogated to himself to interfere into the affairs of the states. It is a pity that a federal system like ours permits such excessive interference of a party's high command into the affairs of the states.

Financially, the ministry is not viable. State governments spend on an average over Rs 5 lakh a month on a minister and his establishment. The government of Karnataka would be spending a whopping Rs 4 crore on maintaining the ministry every month, which is a conservative estimate. Annually, it would come to Rs 48 crore. This at a time when the state government has borrowed Rs 200 crore from Peerless agency at 18 per cent rate of interest!

By inducting Ramesh and Thimmappa into the ministry, the chief minister may have exonerated both these ministers. But would the people exonerate them? For the first time, the legislators from ruling and opposition parties and the public are asking Moily the very same uncomfortable questions Moily had asked Bangarappa as a chief dissident about probity in public life. As it is, the Congress did not have much of an image in Karnataka due to squabbles and infighting. Now the chief minister, who was expected to lead the party out of the mess it was in, has landed himself in the same mess.

A message the Congress people have been given by the reshuffle of the ministry is that dissidence pays rich dividends. Not only have a majority of the dissident ministers been accommodated, some of their friends who were not in the ministry have too found a place. Instead of chopping the dead wood, Moily has added more. A new Congress culture is evolving even in the southern states!

Nutritional Status of Tribal Children in Birbhum District

Ruby Saiu

Untimely death and severe malnourishment are characteristic features of the child population in tribal villages of Birbhum district

MALNUTRITION and undernutrition constitute a serious hazard to the growth and development of people, particularly children Although poverty is a major cause of malnutrition, there are also socio-cultural factors that have kept large population groups in need of an adequate level of nutrition

Nutritionally, the worst sufferers are children, expectant and nursing mothers Undoubtedly, improved purchasing power can upgrade nutrition but it will take a long time before the benefits of the development process can reach those groups in the low income levels The basic causes of malnutrition in our country are the non-availability of nutritionally balanced and acceptable foods, low in cost to the poor

According to FAO reports there are about 460 million people—15 per cent of the world's population excluding China—who are malnourished of which about 300 million live in South Asia where they constitute one-third of the population What makes that situation most serious is that the main victims of malnutrition are children under 5

The problem of malnutrition is more acute among the children of backward communities whose parents are deprived of socio-economic rewards Backward communities people are still a deprived community They are still the victims of social, economical and political helplessness and hopelessness Due to lack of education they also fail to appreciate the nutritional knowledge and as a result they do not serve the food which may be available cheaply and easily and which would be nutritionally correct

We explored the problem of nutrition and hunger among the Santals living in three villages of Birbhum district Educationally, most family members in three villages (62 73 per cent) are illiterate Only a very few (8 22 per cent) had studied up to the primary and junior levels Only 0.19 per cent were found to be literate in the strict sense Regarding occupational status the majority of the population (28 68 per cent) in three villages are engaged in agricultural labour work A very small percentage, 4 59 per cent are engaged in agriculture-related jobs The spatial distance does not reflect any influence on occupational choice and status The distribution of the family income shows that a large proportion of the families (26 83 per cent population in Aynadanga village, 34.09 per cent in Upparkhara village and 55 56 per cent in Mostala village) fall within the income range of Rs 301 Rs 500 per month Only 7 32 per cent families in Aynadanga village, 4 55 per cent in Upparkhara village and 5 8 per cent in Mostala village earn comparatively higher, i e, Rs 1,100 and above per month The trend yields that the village nearest the town, i e, Aynadanga has a comparatively better economic status

Our results show that of the total population of three villages 40 per cent of malnourished are children of the age group 0-12 years In Aynadanga village which is within 5 km from the nearest subdivisional town 44 68 per cent male children and 35 14 per cent female children are of 60 to 75 per cent of the standard weight, i e, they suffer from grade II (moderate) degree of malnutrition 27 66 per cent male and 13 51 per cent female children are of less than 60 per cent of standard weight, i e, suffer from grade III (actue) malnutrition which requires immediate medical attention Only 12 77 per cent male and 18 92 per cent female children are normal In Upparkhara village which is within 15 km of the nearest town 6 67 per cent male and 10 per cent female children are of more than 90 per cent of standard weight, i e, they are normal In Mostala village, which is 15 km and above from the town only 5 88 per cent female children are in normal condition, 26 67 per cent male and 29 41 per cent female children are on the verge of malnutrition It is very striking to note that a very few children (12 77 per cent male and 18 92 per cent female children in Aynadanga village, 6 67 per cent male and 10 per cent female children in Upparkhara village and 5 88 per cent female children in Mostala village) are nutritionally sound but the great majority of the children are partial and full victims of malnutrition

A large proportion of the population under study (34 15 per cent in Aynadanga village, 29 55 per cent in Upparkhara village and 44 44 per cent in Mostala village) consume less than the minimum of 2,800 calories Only 21 95 per cent population in Aynadanga village, 18 18 per cent in Upparkhara village and 16 67 per cent of Mostala village consume more than 2,800 calories

Among tribal population of three villages deficit of calorie consumption (per day) from actual daily requirement (on the basis of sex, age and work) shows the following picture. In Aynadanga village, 31 58 per cent (12+) population have regular deficit of calories from actual requirement of about 500 and above and 31 58 per cent in the same age and sex, group population have a per day deficit of consumption of less than 100 calories In Upparkhara village, which is within 15 km from the town, among 50 per cent male population (12+) regular deficit of calorie consumption is 500 and above In Mostala village, which is more than 15 km from the town, among 60 per cent male population (12+) per day deficit of calorie consumption is 500 and above In the case of women (12+) of Aynadanga village 38.46 per cent and in Upparkhara village 46 67 per cent have a regular calorie deficit of 500 and above In the case of Mostala village this deficit is found only among 10 per cent of the female (12+) population In case of male children of 0-12 years of age group 24 per cent of Aynadanga village, 30 30 per cent of Upparkhara village and 50 per cent of Mostala village have a regular calorie deficit of 500 and above In the case of female children of 0-12 years age group 27 78 per cent of the village 5 km distance from the town, 45 16 per cent of the village 15 km distance and 50 per cent of 15 and above km distance village from the town have a regular deficit of calories consumption of about 500 and above Most of the children in three villages have a constant and sometimes increasing calorie deficit of 500 calories and above which may be one of the indicators of malnutrition

Nutrition consciousness regarding introduction of supplementary foods in infants' diet from four months onwards reflects interesting features in the three villages Only 4 55 per cent families in Upparkhara village have a favourable attitude regarding introduction of supplementary foods in infants' diet The result relating to feeding habits, in Aynadanga village 34 15 per cent mothers, in Mostala village 27 78 per cent mothers regularly give food to their children not allowing other's interference In Upparkhara village which is within 15 km from the nearest town, 95 45 per cent mothers give food directly to their children

Mortality of children between 0-12 years of age group shows that in the three villages under study 96 per cent male and 100 per cent female children died within 0-48 months and mortality rate is higher for females among the tribal people Among tribal male children fever accounted for 52 per cent of deaths Besides 16 per cent of male children died due to diarrhoea and dehydration In the case of tribal female children 47 06 per cent died of fever and few of tetanus, diarrhoea and fever with cough and cold

Rebellion in Chiapas

Colonial History of a New World Disorder

Vinay Lal

The rebellion in Chiapas, Mexico, provides a faint glimmer of hope that the 'new world order' will not so easily be put into place.

JUST hours into the new year, several hundreds—and possibly as many as 2,000—armed peasants attacked and briefly occupied four towns, San Cristobal de Las Casas, Ocosingo, Altamirano, and Las Margaritas, and the Rancho Nuevo regional military base in the southern state of Chiapas, Mexico. Constituting themselves into the self-styled Zapatista National Liberation Army (EZLN), which takes its name after Emiliano Zapata, a legendary figure in Mexican history for his defence of the rights of the poor and the landless, these guerrillas issued a 'Declaration of War', and stated their intent to "advance to the capital of the country" after engaging and overcoming the Mexican Federal Army.[1] Although the government of president Carlos Salinas de Gortari at first indicated that it would be willing to negotiate with the rebels and accordingly did not go on the offensive, within a couple of days the Mexican army was brought into Chiapas, and the guerrillas retreated into the hills and the safety of dense forests. Over a hundred casualties had been reported in the first few days of fighting. Amidst widespread reports of atrocities committed by troops and of summary executions of captured rebels,[2] the government appears to have moved swiftly to silence its critics and appease the poor peasants of Chiapas, promising new food programmes, farm subsidies, and other aid. By the early part of the second week, between 10,000-15,000 soldiers had been moved into the area, and the four towns had been retaken by the army. Casualties had mounted swiftly; the bombing by air of many villages, and the death of numerous civilian non-combatants, evoked much criticism. Salinas removed the interior minister, Patrocinio Garrido, formerly the governor of Chiapas, and chose Manuel Camacho Solis, formerly mayor of Mexico city and Salinas' foreign minister, to negotiate with the rebels. On January 12, the government declared a unilateral cease-fire, and offered the rebels amnesty, an offer to which Commandante Marcos, the masked leader of the Zapatas in whose name the guerrillas have released their communiques, responded with the following words: "What are they going to pardon us for? For not dying of hunger? For not keeping quiet in our misery? For not having humbly accepted the weighty historic burden of scorn and abandonment?"[3] Fighting nonetheless came to a standstill, and in mid-February the rebels even released their prize hostage, Absalon Castelanos Dominguez, the 70-year old former governor of Chiapas whose administration was infamous for corruption and abuses of human rights, and whom a tribunal convened by the rebels had sentenced to "a life of hard labour in one of the communities that had suffered under his rule".[4] There has been some reluctance on part of the leaders of the rebellion to engage in direct negotiations with the government, for the precedent of 1919, when the government of Mexico arranged for the assassination of Emiliano Zapata while pretending to bring him to the negotiation table, has very much been on their mind as their written communications suggest.[5] However, as of early March, negotiations had been commenced.

The rebellion in Mexico, as many commentators have noted, could not have come at a more embarrassing moment for the government of president Salinas. When Salinas first came to power, he almost at once initiated a programme for the economic transformation of Mexico. Although not a 'Chicago boy',[6] Salinas was trained at Harvard, another notorious seat of unimaginative economic thinking and political and intellectual conservatism, and he proceeded to implement his plan to set Mexico on the path of a free market economy by auctioning state-owned firms, opening the economy to virtually unhindered foreign investment, drastically cutting import tariffs from 100 per cent to no more than 20 per cent, and repudiating the constitutionally-ordained obligations of the government to provide for the redistribution of land. In a report furnished by the Bank of Mexico, it is revealed that Mexico in 1992 had only 217 state-owned firms, compared to 1,555 in 1982: among the state industries which had been sold are telephone companies, Aeromexico (Mexico's international airlines), and Mexicana (the state airlines). The largest private-sector employer in Mexico today is General Motors; and if in 1974 wages were one-fourth of what they were in the US, by early 1990 they had decreased to 10 per cent. Foreign investment in Mexico had risen five-fold from $ 10 billion in 1980 to over $ 50 billion in 1992.[7] Section X of the Mexican constitution of 1917, which guaranteed peasants "communal land", even if it entailed in expropriation of land at the expense of the federal government, was repealed in 1992. Thus, while three years ago there were 25,000 unresolved land claims in Mexico, today there are fewer than 3,000 of these cases, the vast majority of them having been resolved by turning down the claims.[8] The crowning achievement of Salinas, as he himself saw it, was Mexico's entry into the North American Free Trade Agreement (NAFTA). With the ratification of NAFTA, Salinas imagined that Mexico had been set on the irreversible path towards greatness as a modern, industrialised nation, a fantasy that he shares with many third world leaders; the rebels saw it quite differently, for as Commandante Marcos put it, "The free-trade agreement is a death certificate for the Indian peoples of Mexico, who are dispensable for the government of Carlos Salinas de Gortari. We rise up in arms against this death sentence from Carlos Salinas".[9] Thus, when the rebellion broke out, just hours after NAFTA went into effect and in the year when national elections are due to take place, it was a rude reminder of the presence of what Jorge Castaneda (and others) call the "Other Mexico".[10] This is the Mexico where, despite vastly increased social spending by the government, and the initiation of widely-touted anti-poverty programmes such as 'Solidarity', 16 per cent of the population is officially described as living in "extreme poverty", and another 27 per cent as "poor"; a quarter of the labour force is out of work, but Mexico now has seven billionaires, as many as in Britain.[11]

As in many countries that have agreed to come under the tutelage of the US and the IMF, the disparities in Mexico have increased enormously; 10 per cent of the population controls 41.4 per cent of the national wealth.[12] But to understand why the rebellion took place in Chiapas and why it has taken its present (somewhat archaic) form, given the demise of the left throughout the world and particularly guerrilla-type left movements in Latin America, we need to embed the rebellion both in the history of Chiapas since the conquest of Mexico by the Spanish conquistadores, and in the geopolitics of the new world order today. The colonial past of Chiapas may appear to lie at a great remote, but as the guerrillas of the Zapatista army stated in their 'Declaration of War', "We are a product of 500 years of struggle: first against slavery, then during the war of independence against Spain led by insurgents, then to avoid being absorbed by North American imperialism."[13] One of the four towns captured by the rebels, San Cristobal de Las Casas, takes its name from the Dominican friar Bartoleme de las Casas, who was to accompany Cortes on his conquest of Mexico, and subsequently acquired fame as the protector of the rights of Indians. In 1544, when he was already 70 years old, Las Casas agreed to take charge of the poor and little-known bishoporic of Chiapas, presumably to aid Dominicans in their effort to preach the faith without the use of force, a subject on which he had already written his treatise, *The Only Way of Attracting All People to the True Religion*.[14] Las Casas came to Chiapas bearing in hand the New Laws signed by Charles V of Spain, which governed the conduct of the Spanish colonists

in the Americas, and forbade them to enslave Indians. The 'encomenderos', the colonists and descendants of conquistadores, inveighed against the New Laws, an attempt is said to have been made on Las Casas' life. In 1547, Las Casas returned to Spain, a few years later, he was to take part in a memorable debate at Valladolid between Juan Gines de Sepulveda and himself on the two-fold question of whether some men are (as Aristotle had maintained) 'slaves by nature', and whether a just war could be waged against the Indians. Las Casas won that debate, he was now to devote the rest of his long life to exposing the cruelties perpetrated by the Spanish upon the Indians.

Las Casas could achieve very little, however, when we consider that it was not until the early 1980s that Indians were allowed on the side-walks of San Cristobel de Las Casas.[15] The history of Chiapas has been a gravely troubled and unfortunate one from the earliest days, what remained of the Indian population after the conquest was further decimated by disease, a measles epidemic in 1529 taking a heavy toll. Two-thirds of the indigenous population of Chiapas and Guatemala is estimated to have been wiped out between 1540 and 1582 on account of smallpox, pneumonia, bubonic plague, and famine. The traditional social structures were being rendered obsolete, on the other hand, a struggle for the control of the Indian population and the right to direct the local social and political transformations was being waged between the encomenderos, the descendants of the conquistadores who had acquired large properties in land, and the Dominicans who insisted on promulgating the teachings of Las Casas.[16] Among the Indian elites who were thought to have converted to Christianity, many continued to indulge in "idolatrous worship" in their private lives, offering traditional ceremonies to ancient gods. Thus originated the 'Conspiracy of the Twelve Apostles', a reference to 12 men of principal Indian lineages who, though known to be Christians, had been accused of partaking in a 'clandestine cult" that offered "demonic rites" against the Christian religion.[17] Shamanism was to become the vehicle for cultural resistance and, as some scholars have suggested, may have contributed to nativist movements of later periods in Chiapas, Yucatan, and Guatemala. The history of rebellion in Chiapas, in any case, is as old as that of the conquest, and it is in the framework of the Tzeltal Revolt of 1712, the Jacinto Canek Rebellión in 1761, the Anastaco Tzal Revolt in 1820, the Tzotzil rebellion of 1868, and the long-lasting Caste War in Yucatan that we must place the recent rebellion in Chiapas. In the Caste War, among the first things that the Mayas, who had risen against their European overlords, did was to invade the city centre of Valladolid, from which they were banned. Their battle cry, it is said, was "Kill everyone in trousers!"[18]

Although the revolution of 1910-17 appeared to promise sweeping changes, particularly agrarian reform, the redistribution of land was left to the big landlords and ranchers, the very gentry that was opposed to the dismemberment of their haciendas, moreover, the remoteness of Chiapas, which lies at the southern end of Mexico, to the east of the state of Oaxaca and north of Guatemala, of which it was once a part, engendered an attitude of indifference among the bureaucrats in Mexico city. The revolution reaffirmed the rights of Indians to collective ownership of land, and during the presidency of Lazaro Cardenas in the 1930s millions of hectares of land were redistributed, another such redistribution in Chiapas took place in the 1950s and 60s, raising the number of families on 'ejidos', or collective farms, from 71,000 in 1950 to 1,48,000 in 1970. The land so distributed, however, often had the poorest soil, and without financial support the productivity of these ejidos has not only remained very low, often not even enough to support the families that farm the land, but has been vastly outstripped by private agriculture. As the rebels have pointed out at the peace talks, redistribution of land will not suffice, the land must be productive, peasants must be offered the use of technology, and the infrastructure (such as roads) has to be available to get produce to the market. Cattle ranches, meanwhile, where exempt from being parcelled out, and over the years the population of the herds has grown enormously, if in the Highland Clearances human beings were driven out to make room for sheep, flung (in Marx's memorable description) "onto the sea-shore" to live as amphibians,[19] in Chiapas cattle is replacing people. Between 1960 and 1976, the area in Chiapas used for livestock grew from 22 per cent to 49 per cent, and 6,000 rancher families, who together constitute less than 1 per cent of the population of Chiapas, hold the title to nearly half of the total land area of Chiapas. Both ranchers and the big landlords have consistently hired thugs to intimidate Indians and make them relinquish their land, as Amnesty International, Minnesota Advocates for Human Rights, and numerous other organisations have documented on previous occasions, human rights abuses in Chiapas are legion.[20] Unable to make a living off the land, the peasants in Chiapas have been driven into the Lacandon forest, home to 12,000 people in 1960, the Lacandon now has 3,00,000 people, and the ecosystem, already rendered fragile by illegal logging and oil drilling, now appears to be on the verge of collapse. War, in more than one way, has come to the forest.[21]

If massive iniquities in landownership suggest why Chiapas is ridden with deprivation, other indicators also point to the problem of endemic poverty. In Chiapas, the rate of literacy is 69.9 per cent, while for Mexico as a whole the rate is 87.4 per cent. In 1990, only 58.4 per cent of the households in Chiapas had running water, and only 30 per cent have electricity today, although a quarter of the electricity consumed in Mexico is generated in Chiapas, the number of hospital beds and telephones relative to the population is the lowest in the region. When we consider that Chiapas has the largest population of Indians of any state, some of the reasons for the neglect of this region become all too apparent. While across Mexico 7.5 per cent people speak an Indian language, in Chiapas this figure stands at 26.4 per cent, moreover, between 30-40 per cent of the Indians do not speak Spanish at all.[22] The bishop of San Cristobal, Samuel Ruiz, controversial for his supposed espousal of 'liberation theology', has estimated that in 1993 alone 15,000 Indians died of hunger, disease, and violence.[23]

One-third of the population is without any access to health care. Nineteen per cent of the workforce of 1.12 million in Chiapas is without any income, another 40 per cent earn less than the federally mandated minimum wage of $ 3.33 per day, and only 15 per cent of the workforce earns $ 6.67 or more a day. While per capita GDP for Mexico amounted to $ 3,250 in 1991, in Chiapas it was $ 1,710, moreover, a third of the GDP in Chiapas is generated in the agricultural sector, more than in any other state.[24]

Considering the history of Chiapas, the grinding poverty of the region, and most fundamentally the fact that the restructuring of the Mexican economy has placed certain segments of the population outside the pale of reform and modernisation—banished them into an "economic exile" and cultural isolation[25]—it is ludicrous to suppose that there were not enough grounds for dissent and rebellion. I have not even accounted for the enormous pressure exerted on Chiapas by the presence of thousands of Guatemalan and other central American refugees in Chiapas, or for the ferment created by proselytising among Protestant missionaries,[26] or the part played by mega-projects of the state such as the construction of huge hydroelectric dams all across the state, in effecting the displacement of a large number of Indians and disrupting the traditional patterns of life. Predictably, however, when the rebellion broke out, the first response of the government was to deny its indigenous origins and attribute it to nefarious influences from across Mexico's borders. The rebels are said to have been influenced wholly by the Sandinistas, left-guerrillas in El Salvador, and other central American revolutionary movements,[27] other figures in the government, and their lackeys in the media and the universities, have even sought to portray the rebellion as an outcome of the 'drug wars'. The pathetic attempt to discredit the rebellion in Chiapas as a (in president Salinas' words) "foreign import"—which is reminiscent of the Indian government's persistent resort to the 'foreign hand' in mitigation of the refusal of certain marginalised sections in Indian society to accede to the notion of sovereignty held by the ruling elites—makes a mockery of the

injustices to which the Indian population of Chiapas has been subjected for nearly 500 years, and as for the other attempt to render the rebellion into an affair of criminal and lawless elements, the Zapatistas themselves provided a most fitting reply in their opening salvo "Beforehand, we refuse any effort to disgrace our just cause by accusing us of being drug traffickers, drug guerrillas, thieves, or other names that might be used by our enemies" [28]

It was less than two years ago that the world 'celebrated' the quincentennial of the 'discovery' of the Americas by a marauding specimen of Christendom by the name of Christopher Columbus, and it is even more recently that the 'blood-curdling' activities in Peru of the Maoist revolutionary party, Sendero Luminoso ('The Shining Path'), which appeared to have been undertaken in partial emulation of the blood sacrifices carried out by the Incas, were arrested with the capture and incarceration of Abimail Guzman, the leader of the Shining Path The rebellion in Chiapas, the events in Peru, and the recent reminders of the history of the enslavement of indigenous populations in central and Latin America by the enactment of grotesque tributes to Columbus and the conquistadores who came in his wake must be viewed collectively as pointing not only to unresolved problems from a torturous and bloody past, but to the continuing attempts by the west to strangulate large chunks of the world's population The west's endeavours at domination may have taken the form of garrotting 'underdeveloped' countries by coercing them to accept GATT and the dictates of the IMF and the World Bank, not to mention the outright decimation of 'hostile' nations, as the relentless bombing of Iraq and other acts of militaristic adventurism by the US and the UK have shown The rebellion in Chiapas provides, then, a faint glimmer of hope that the 'new world order' will not so easily be put into place, and it suggests even that 'disorder' is to be preferred to the regime of 'order' that tyrannical elites posing as torch-bearers of freedom are seeking to impose throughout the world

Gandhari, the Rebel

Jayanti Alam

Gandhari is regarded as a symbol of the devoted wife who is subservient to her husband, body and soul. She had even blindfolded herself because her husband was blind. But was she really subservient to her blind husband who was, in the real sense, blind to all injustice and immorality?

GANDHARI, like Sita and Savitri, is revered and fondly remembered by all Indian women whose only aim and ambition in life is to blindly 'adore' the husband and be subservient to him, body and soul. The ideal example to prove their fond conviction is that Gandhari had blindfolded herself because her husband was blind. Most of us have recently gone through the experience of watching 'religiously' the 'filmi' presentation of our great epic. Have we really found Gandhari subservient to her blind husband who was, in the real sense, blind to all injustice and immoralities? Her inner eyes, behind the blindfolded ones, seemed to have developed special power of seeing even that which normal eyesight could not detect. Historically the Mahabharatian society—particularly, the family-structure and moral norms—appears to be preceding that of *Ramayana*, though in religious chronology, *Ramayana* is the predecessor. It definitely was the age of pre-brahminical supremacy; it is evident from the insignificant role of Kulguru Kripacharya, from the ease with which Kshatriyas got 'var' (boon) from the 'rishis' and 'devatas' and, above all from the peculiar fact that a brahmin (viz, Dronacharya) had to give up his traditional 'adhyayan' and 'adhyapan' (study and teaching) and be supreme in the art of the Kshatriyas, in order to earn his living as well as status

That is why, perhaps, the women in *Mahabharata* enjoyed quite a bit of freedom of thought and expression, though their activities were confined to the 'andarmahal' (ladies' section of the palace); that is why, perhaps, more or less the same moral standards were applicable to men and women (Yudhishtira was no less censored for 'selling' his wife in the gamble). When Draupadi was actually stripped and sexually humiliated in front of so many men the moral blame was totally on the men (not merely on Duryodhan or Duhshashan); in fact Draupadi was admired—and later adored—as pure and spirited. Sita in *Ramayana* had actually remained chaste and untouched by Ravana; and even if she were not, it was not her fault (just as, it was not Draupadi's); yet was suspected by her 'god' husband (the god is supposed to be the abode of all virtues) and the humiliation she did not have to suffer in the hands of her enemy; she suffered in the hands of her own 'loving' husband (who is said to have gone mad having lost Sita). Thus *Ramayana* shows the typical brahminical morality—which pervades even the pre-21st century—that it is the victim of sexual crime who is to be blamed, as she happens to be a woman and not the criminal since he is the man. The Mahabharatian women, even when finally yielding to the male value of "must have-a-son", pleaded, objected and protested (like Ambalika and Ambika). Can we find a character like Amba, even among the 'feminists', who vowed to take revenge of her insult by Bhishma and left no stones unturned to do so? To have a male child was a must no doubt (like it is today), but can we think in the present society of the child's identity from the mother, as it was in case of the Pandavas who were, very often, called Kaunteyas? Can we think of the husband asking his wife to cohabit with another male because he is incapable of becoming a father, as Pandu had asked Kunti? The post-brahminical husbands would rather marry again, declaring the wife a barren; and then go on marrying since he never will be able to produce a child. Can we also think of a widow conceiving (as it was in the case of Ambalika and Ambika). Since women have always been primarily an object of sex and pleasure for men in all societies, sexual freedom and sexual identity of the women is a very important indicator of women freedom. The more important indicator is the fact that no moral judgment was made on the woman for the man's crime. In such an emancipated society can the blindfolded Gandhari be considered the epitome of the wife's blind subservience to her husband?

We have seen that the reigning strain in Gandhari's life is her strong sense of justice, which always remained strangled, and the unending suffering because of that helplessness; her sense of fairness was so strong and deep rooted—it was, in fact, part of her personality—that not only she constantly argued with her husband, the king, but she did not hesitate to curse even Krishna, whom she very well knew as the god. We have seen her raising the point of law governing the king and his kingdom when Yudhishtira was being sent alone to Khandavprastha in the pretext that he was the crown prince; but then, Duryodhan also was a crown prince She was almost dying in shame when she heard of the Pandavas burnt to ashes. She was not only the mother of Duryodhan (who else but the mother knows her son best?), but also possessed the shrewd mind of a kshatriyani

She knew that Bhishma, Vidura, Dronacharya, etc, will definitely not leave Dhritarashtra at the time of a war with the Pandavas because of their unfailing, blind loyalty to the throne (we have seen them tolerating all immoral acts of the Kauravas because of this loyalty), but she also feared that they would not like to win against the Pandavas, who represented Dharma. Gandhari, time and again, explained and pleaded to her husband not to deprive the Pandavas of their legitimate and legal share. The thrust of her argument was that Dhritarashtra was first the king and later a father; so he should be guided, in all his actions and decisions, by law as well as the welfare of the people of Hastinapur, and not by his sentiments and ambitions as the father of Duryodhan.

We shall be totally wrong and unjust to Gandhari if we tend to think that Gandhari did not have a mother's heart. On the contrary, her love and concern for her sons were so deep and genuine that she dreaded to visualise the day when her sons will get the cruellest punishment in the hands of justice—which ultimately has to triumph. Besides, as a mother, she used to feel terribly ashamed to see the shameless behaviour of her sons. After all, all mothers' most cherished desire is to feel proud and happy with their children. That is the supreme reward of motherhood. The mother's heart must have fallen into the seventh inferno when the ultimate of male prowess exposed itself in its ugliest form, i e, when Draupadi was molested and insulted, with the champions of fairness like Bhishma and Vidura keeping their eyes down. But, at this stage it was not merely the mother's heart, but also the heart of a woman at the mercy of male authority and above all, the mind of a judge.

Rabindranath portrays Gandhari from this angle. It is no wonder, since the women in his short stories and novels are always individualistic without being rebels, they possess a deep sense of fairness (please do not club it with morality), they are not flirts, but do not also pay any special value to loyalty or chastity; they do respect and quite often, love their husbands but do not consider them infallible or beyond any criticism; they, almost always, have rational discussions and arguments with the males, other than their husbands also (as in 'Ghare Baire', 'Gora', 'Raktakarabi'), they do not rebel or leave the society, but do establish their identity and retain it till the last Even when Gandhari finally took off her blindfold (Gandhari is believed to have done so when she was in Banaprastha with her husband) it was not her

final submission to her husband, but reassertion of her concern (we do not know whether she loved Dhritarashtra) for her blind, helpless husband

Rabindranath's Gandhari is also a feminist, she is angry and ashamed at the terrible humiliation of Draupadi Draupadi comes out here not just as the daughter-in-law (Kulabadhu), but as womanhood (nareetva) personalified She is also, to Gandhari the glowing symbol of the prosperity and welfare of the Kauravas She says "a mother's pride, her last hope got shattered and scattered into pieces at the impact of the guffaw of my inhuman sons' So she pleads to the king "have mercy on me and deliver a mother from this shame, have mercy on your sons and deliver them from the poison of your blind filial love, have mercy on Hastinapur and let dharma once again rule over it Please, please, forsake your sinning sons" She also added, "this noble act of yours, o king, will restore the lost glory of womanhood and its virtues" Gandhari's feminism reaches its sublime height and she emerges as the apostle of justice, as if, when she tries to comfort Draupadi by saying, "he who has disgraced you will remain immortal in the history of mankind as disgrace and cowardice personified, your disgrace is miniscule as it has been equally shared by all women of the world"

Kunti also is known as an affectionate and concerned mother But Gandhari's affection was far nobler It was her constant endeavour to prevail upon her waylaid husband and children that they were following the path of 'adharma' (injustice or immorality) and therefore, destruction But, definitely, her love for justice or fairness prevailed over her love as a mother, not a single time she was carried away by emotion when Duryodhan came for her blessings before going to war However, much her mother's heart pined and wept—for she, too, cherished the grand idea of being the Rajmata (the king's mother)—she could not give the blessing of Vijayshree (victory) She knew only dharma' can win She also earnestly believed that 'dharma' alone should But did she really believe that her erring sons should perish at the altar of justice or morality?

No, how could she? Was not she a mother? Had not she suffered the pangs of giving birth a hundred times? Has not she shed a million tears for their good sense and welfare Has not she, many a times, appeared to be too strong and stone-hearted for the good of her sons? The mother Gandhari emerges out in her purest form when she takes off the blindfold from her eyes for once she had acquired divine powers and could make a body immortal by staring at it She could not sacrifice her scruples and wish Duryodhan win, but she also could not sacrifice her filial feelings and see Duryodhan die So she asked her son to take a dip in the holy river and come totally naked to her so that she could stare and make his body immortal The other occasion when Gandhari's undaunted

outspokenness burst out like a bomb from the mother's heart and benumbed even Krishna, master in the art of outwitting others, was when she came to know that Duryodhan was killed by foul play; her shock and anger were so exaggerated because she realised she was poorer not only by Duryodhan's death but also by the loss of her conviction that the Pandavas were the torch-bearers of 'dharma'. This is the most noble situation where this noble lady's love as a mother and love for fairness express themselves in their most fascinating beauty. She loses her balance, for once, and throws out a deadly curse on the Yaduvansha—a curse on the god himself.

Kunti, the proud and fortunate mother, comes out as most ordinary—maybe even lowly in comparison to Gandhari. No other mother character in *Mahabharata* was so heartless as Kunti was (not even Ganga, though she appeared to be, as she used to drown each and every of her new-born infants). An unmarried, immature mother can, perhaps, discard her baby; but can a mother's heart continue to see the humiliation and hardship that her child (Karna) continuously suffered. In fact, *Mahabharata* portrays Karna's character—his strength of mind and conviction—as far more stable and noble than any of the Pandavas. And Kunti was fully aware of this. Could not she learn from Gandhari that there is nothing shameful in condemning what is wrong—be it in oneself or in one's dear and near ones? Could not she accept Karna back when her other son (Arjuna) insulted him so badly? Instead of rectifying her adolescent blunder (we know, from our earlier discussion that in the Mahabharatian society it was not difficult to do) she took advantage of Karna's nobility and ensured the safety of her five socially accepted sons. She neither had a mother's heart, nor a sense of justice; she only had the ambition of a Rajmata (the king's mother).

At this juncture of our discussion, I think, it becomes quite clear why Gandhari decided to blindfold herself right from the night of her marriage. Since her life started with injustice imposed upon her, her heart and mind rebelled against seeing more and more injustices which may be waiting for her in the long and difficult journey of her living. A beautiful, intelligent and talented princess being married to a blind prince, who had no hope of becoming a king in spite of being the elder—what can be a worse injustice than this? I have pointed out earlier that though women of *Mahabharata*, unlike their pre-21st century counterparts (or, should I say, compatriots?) were not victims of male moral judgments, they had no right to choose their life's partner. Swayamvara was a poetic mockery of women's freedom. In fact, every thing was pre-destined. Destiny repeatedly shows its cruel teeth in the utter restless helplessness of the apostles of principle—the foremost among them being Bhishma. Gandhari, herself, is a pathetic example of helplessnesss of principle in the hands of Destiny. Women, definitely had freedom of speech and expression, but that could not be translated into action or actuality, since everything was 'que sera, sera' (remember the famous song from Hitchcock's 'The Man Who Knew Too Much'?) Even the king, who appeared to be the supreme command (we have seen how elderly stalwarts of principle and statesmanship kept numb in front of the throne when the worst calamity, viz, insult of Draupadi, was threatening Hastinapur) was only a pawn in the 'chausar' game of Destiny. Gandhari's inner eyes must have been 'Krantadarshi', i e, perceiving beyond the horizon. (In Sanskritic tradition, both the poet and the philosopher are called 'Krantadarshi'.) So, she feared to see the day-to-day play of Destiny. She, obviously, did not also want to see the proof of her apprehensions about her ambitious but weak, thoughtless and unwise husband by seeing his day-to-day actions and short-sightedness. She preferred to keep herself ignorant and oblivious of the calamities that were bound to shake the very foundation of Hastinapur. She was too wise not to have a sneaking fear about the destruction of her own family. Above all, Gandhari was worried about her own capability of keeping her mental cool and balance towards her handicapped husband who, she knew, was inferior to her in every respect—not merely in his inability to see. She also wanted to block the possibility of pity that might germinate in her mind for her blind husband if she too were not disabled.

When the Kurukshetra war finally saw the demise of 'adharma' (viz, the Kauravas headed by the blind king Dhritarashtra and his 'blind' son Duryodhan) and the inevitable victory of 'dharma' (the coronation of Yudhishtira), Gandhari 'went to the jungles' (that is 'banaprastha') along with her husband and also Kunti and Vidura. Once, while roaming about among the breath-taking beauty of the Himalayas, which can bring peace even to the most disturbed mind, Gandhari gave out a deep sigh. Dhritarashtra's sixth sense made him realise that his wife was missing her childhood (as Qandahar or Gandhar also is a mountainous region) and lamenting over the post-marital life which had totally deprived her of the beauty, charm and peace which only her pre-marital life was able to give her. He also accused Gandhari of holding this grudge against her parents and her in-laws even till the end of her life when she had nothing more to lose. He further says "it is true that great injustice was done to you by getting you married to a blind, but have you also not been unjust to me by remaining hurt and unhappy till this day"? At this stage we find Dhritarashtra no longer blind. How can a blind man see so deep and so perfect? So, he pleads to his 'patibrata' wife, "please, Gandhari, for my sake, take off your blindfold and no longer shut yourself out from the world around you". According to Irawati Karve, Gandhari did finally decide not to remain blind; she did take off the cloth covering her eyes.

Gandhari's 'blindness', in fact, was welcome to all the representatives of male authority—to Dhritarashtra, to the Pandavas, to god Krishna and even to the author of *Mahabharata*, the powerful sage Vyasadeva. When Duryodhan was killed by Bhima trouncing the rules of war, even Yudhishtira, adored by Gandhari for his love for justice, could not gather the moral courage to face Gandhari. So Krishna was sent to face the wrath. The Pandavas knew very well that her dearest son's death will not shock her as much as Yudhishtira's slip from the path of fairness will. And it did happen as feared. Gandhari's anger and disappointment knew no bounds and she did not hesitate to curse even the god. (We should not forget that she was a great devotee of Sri Krishna, as Kunti was.) At this juncture Sri Vyasa intervenes. In social relationship he is the father-in-law and therefore to be greatly revered and obeyed without any questioning. Even he begged of Gandhari to control her anger and disgust because who else could know better than him (he was not only a sage with farsight, but also the author of *Mahabharata*, itself) that the anger and forgivelessness of an honest and spirited woman can destroy not merely a person, or a family, but even a kingdom and a nation. He knew that Dhritarashtra's jealousy and ambition have destroyed the Kauravas; now Gandhari's shock and disgust can finish the Pandavas. Here Gandhari appears gloriously as goddess Durga—the most beautiful manifestation of the moral and spiritual power of womanhood, to whom even Siva, the god of destruction, bows down.

Ultimately, but, the woman in Gandhari reigns over the mother in her. She manages to calm herself down only when the number one accused Bhima explains to her that what he did was morally wrong and even barbaric (referring to drinking Dushashan's blood), no doubt, but there was no other way out as he was morally bound to take revenge of Draupadi's insult. We cannot forget how she had cursed her own son saying that he would become immortal in the world because of the terrible insult he has meted out to his sister-in-law Draupadi, and through her, to all the women of the world. We cannot also forget how she had pleaded with and begged of her husband to forsake his son for the sin he has committed against womanhood; she had gone to the extent of saying that mother's pride will be restored only when such a shameless son is forsaken. Can a mother's heart say this? No. It, definitely, is the woman's heart—a woman who is always an outcast in an upper-caste-male society. Gandhari was a rebel whose parallel we cannot find even among the feminists of the pre-21st century 'civilised' human society.

Coping with Globalisation

Andre Gunder Frank

Regime Transformations and Global Realignments: Indo-European Dialogues on the Post-Cold War World edited by Kanta Ahuja, Huub Coppens and Herman van der Wusten; Indo-Dutch Studies on Development Alternatives; Sage Publications, New Delhi, 1993; pp 418, Rs 375.

IN a fast-changing confusing world and for a volume of proceedings from a conference held in the Netherlands in 1992, this volume of 24 chapters stands out as a model of good selection, clarity of organisation and presentation, voluminous information, serious analysis, and continued relevance. It offers wide-ranging reviews of recent, present and foreseeable future transformations and realignments in the post-cold war world. Several authors peer into the future by presenting sets of three or four alternative 'scenarios' without however committing themselves or the reader to any of them.

The editors' general introduction of the truly global issues is followed by five different but related sections, each again with its own clear introduction/summary of the four or five chapters that follow (and the not reproduced conference discussion) on (1) the post-cold war transformation of the 'communist' east, including China; (2) the resulting global geo-political economic realignments, especially in and for Europe; (3) reorientations in and among the east and the south of the world; (4) the role and place of India; and (5) problems and proposals of worldwide 'good governance' for the future. The problematique and theme of the volume can be aptly summarised by a sentence from one of the contributors (Gottfried van Benthem van den Bergh: 103-04) that "the fact that global institutions are lagging behind the rapidly developing global inter-dependencies and transnational markets is the fundamental problem of the modern world". S N Eisenstadt contributes a reflective epilogue on the same.

Ramnath Narayanswamy reviews the mostly domestic causes of 'socialist' breakdown and subsequent events; and the Russian economist Stanislav Menshikov analyses the also largely domestic political and economic forces now in contention in the former Soviet Russia, Ukraine, and Central Asia (but with prospects in the latter also depending on uncertain developments in the first one) and in Poland, Hungary and Czechoslovakia (but distinguishing between the two parts it would soon split Into) in Eastern Europe. For each of the first three, he offers three scenario alternatives (shock therapy leading to pure jungle style capitalism, gradualism with mixed welfare state capitalism, return to some kind of market socialism) which range from muddling through at best to total chaos probably leading to military/nationalist takeovers domestically and concomitant dangers internationally. In a book on 'global transformations' the *world* political economic impact on regional developments receives too short schrift in this reviewer's (*EPW*, November 14, 1992) opinion. Wouter Tims (and Menshikov again in a later chapter) show how and why China managed better by reforming agriculture first, not scrapping old economic and political institutions before they could be replaced by new ones, and in general opting for gradualism instead of 'shock therapy' that paralyses or kills the patient. Catrinus Jepma employs simulation models to present long-term scenarios of the alternative consequences for the south. None are cheery, except that "South Asia will benefit in practically all circumstances", while "China will lose ground to some extent in any situation", eastern Europe will gain little from aid even if it receives any; but east Asian and Latin American NICs will experience competitive disadvantages, OPEC oil producers will suffer from ex-Soviet competition in energy supplies, and sub-Saharan Africa will drop off the map

The second section debunks American hegemony and discards the possibilities of near future uni-polarity. Instead, van den Bergh considers alternative (or combined?) scenarios of a triple (North American, West European, East Asian) cores with Orwellian 1984 style competition and shifting alliances, trilateral co-operation among the same, and a United Nations governed world "none of which appears particularly plausible" (p 118) to the author, and the last two not to this reviewer. Rajen Harshe and A P Rana continue in the same vein, with the latter hypothesising a 'New Northern Concert of Powers' with Europe as a major constituent, disarray in the 'Developing South', and pax collaborata as an uncertain outcome. European economic (dis?) integration after Maastricht and (in?) security after the cold war are usefully examined by Robert Cohen and Gautam Sen.

The third section extends the analysis to the place ad role in these global realignments of the east and south. Hans Linnemann documents past, present and probable future marginalisation of the south and uncertain reintegration of the east in further competition with the south in a globalised yet regionalised world economy in which over two-thirds of world exports are from the developed OECD countries, which do over half of their trade with each other. In this context, possibilities for regional south-south co-operation receive a "rather unfavourable assessment" (p 199). For that reason among others, V R Panchamukhi insists on still holding high the flag of the Non-Aligned Movement's "need to assert sovereignty and independence in thinking", especially about the "economic agenda" (pp 217-18). Menshikov returns with an Innovative suggestion of a possible 'New Eurasian Bloc' reaching from the Danube to the China sea "to counterbalance Japanese domination in the Far East. China is a logical partner for Russia in that region" (p 225). The Russian Menshikov invokes the 'Eurasian' label without mentioning that it also has an important and recently revived anti-European political connotation among eastward looking imperial nationalist Russians (*EPW*, December 18, 1993) and (hopefully independently!) an anti-Eurocentric ideological one among writers, who like myself refer to Afro-Eurasia, or more accurately Afro-Asia/Europe, as the main locus of most of world history. Kurt Radke and Charan Wadhava conclude the section with, respectively, reviews of disunity in east Asia and attempts to forge more unity in south-east Asia.

The next section concentrates on India, but also in its past relations with the Soviet Union and its future ones with Europe, Russia and China, and in south Asia. Kanta Ahuja, Suresh Tendulkar, and R J Gidadhubli recall the special relationships between India and the Soviet Union and how the latter's demise now affects the same on economic, ideological, and political levels in India. Atul Sarma and Pradeep Kumar Mehta examine India's export possibilities to Europe, which contrary to the above cited Jepma, they see as threatened by CIS and east European competition. Nancy Jetly assesses the uncertain political will, which compromises economic prospects for the South Asian Association for Regional Co-operation.

The final section returns to the global level, peers into the future, and makes valiant if rather idealistic proposals to improve it or at least to prevent the worst. The problematique is 'good governance' within and among states and regions. The always forward-looking and [overly?] optimistic Luis Emmerij sees a three-speed world economy with the OECD, east and south-east Asia on the fast track; Latin America, south Asia, Middle East, eastern Europe and [why?] China on an intermediate track, and Africa and some other countries on a slow or even stalled side track. He examines some of the dangers of this 'ticking time bomb' division, which is exacerbated by "both the

east and south now practising what the west has preached" in ideological political economic policy (p 341), and argues that the west needs its own perestroika to do the same: Give up its agricultural, multifiber textile, services, intellectual property and other protectionist policies, which cost the developing countries between three and ten times as much as they receive through western development 'assistance'. "All this comes about because we lack vision in the west" (p 345) he says without considering to what extent this lack of 'vision' is the reflection of structural interests. So he proposes a "second Copernican revolution, as it were" centred not separate sovereign states, but on "a system in which nation states revolve around a set of shared core values regarding human survival and human solidarity" [p 349]. Instrumental would be some global or at least initially inter-regional [e g, Euro-Indian] 'development contracts', as already proposed by the Norwegian minister Thorwald Stoltenberg, which would commit *both* contracting parties to 'reciprocal conditionality' and equitably shared economic sacrifices and benefits. Good luck! Gerrit Faber proposes similar arrangements to combat the global greenhouse effect. Each country should receive a population based quota for maximum carbon dioxide and other emissions, which should also be subject to a global 'carbon tax'. To reduce these by half globally, countries in the north [west and east] would have to reduce their present emissions by 70 to 90 per cent, China could maintain them, and India and Brazil could about double them. Therefore, the latter and also less polluting Africa should be allowed to 'sell' part of their allocated quotas to bidders in the rich over-polluting countries.

Last but not least, Paul de Waart confronts 'Implementing, Human Rights: Good Governance as a United Nations Concern' and Rhamatullah Khan 'The United Nations, Good Governance and Global Governance'. While the World Bank's *World Development Reports* are limited to economic growth and poverty, the recently inaugurated *Human Development Report* also introduces an index of human freedom reflecting three of Roosevelt's four freedoms of speech, religion and from fear, but conspicuously omitting the fourth one of freedom from want. "Given that all human freedoms are interdependent and inseparable...a truly democratic society should take economic, social and cultural rights just as seriously" as individual political ones (pp 373, 369). So much for indexing these rights. However promoting and protecting them, even the political ones, is even more problematic in a world of sovereign states in which "in a nutshell, the UN Charter has not provided an administration able to call states found guilty of bad governance to order" (p 376). On the contrary, as Khan documents, the UN was designed [but as we know does not even do well] as a peace-enforcer and *not* as a 'good governance' law-enforcer, unless intra-state violation of law or human rights directly threatens inter-state world peace and 'global governance'. Nor is the UN, even or especially after the 1992 Earth Summit in Rio de Janeiro, entitled or empowered to promote 'global governance' by meddling in the 'internal' affairs of sovereign states that unduly pollute the common global environment. Moreover, today it is especially the weak states of the south who jealously try to defend their 'sovereignty' against any possible encroachments by a UN whose Security Council executive is dominated by a few powerful states in the west and two in the [former] east, as was graphically shown on TV screens worldwide during the 'United Nations' war against Iraq. Today, Bosnia, Somalia, and Ruwanda again demonstrate the legal and practical ineffectiveness of the UN in protecting, let alone promoting, either good governance or global governance. And any legal and practical alternative "could be twisted by the Great Powers into an inquisitorial undertaking against the poor and weak... [so that] a global design that enables the UN to suspend state sovereignty in situations of alleged or proven incapability of the national authorities to govern, or when anarchic conditions prevail, we cannot help but oppose", as Khan writes in his closing sentence (pp 396, 398).

The largely western designed global institutions are indeed lagging behind rapidly developing global interdependencies. However, this 'Indo-European dialogue' at least offers an exceptionally penetrating x-ray diagnosis of the nature and causes of our global patient's illnesses, as well as of the inefficacy of a number of snake-oil quack ideological remedies like the 'magic of the market', even if its own proposed therapy is probably beyond the reach or governance of the all too patient patient. As Mahatma Gandhi is said to have answered about what he thought of western civilisation, it would be a good idea!

Health Care: From Policy to Practice

V R Muraleedharan

Reaching Health for All edited by Jon Rohde, Meera Chatterjee and David Morley; Oxford University Press, New Delhi, 1993; pp xv + 524; Rs 150 (paperback).

IT appears almost certain that reaching the goal of health for all by 2000 AD in India is an impossibility. Consider just the following two facts, in the light of 1978 Alma Ata declaration of what were considered as primary health care needs: in India, as of 1994, of the 860 million people not more than 5 per cent have access to basic sanitation facilities, and no more than 30 per cent have access to safe drinking water! No doubt, several 'developmental projects' (such as Expanded Immunisation Programme) have contributed to increasing the child survival rate, but it is doubtful whether such projects, often carried out in isolation from other developmental efforts, have significantly contributed to the overall growth and development of the children whose lives they have saved. Similar doubts exist as to the overall impact of the health policy in India on the state of health of the people over the years.

Under what conditions can development projects and programmes aimed at improving the health of the people succeed? How can such programmes be expanded, replicated and sustained over a period of time? In essence, these twin issues are the guiding goals and the motivating factors for the authors of this book in narrating the experiences of the various national, international and community-level programmes. The central theme of this book (which is a collection of 22 essays contributed by 28 different authors from various parts of the world) is that any development policy that does not adopt a bottom-up approach, that does not aim to transform the role of the people from merely being passive beneficiaries into active participants of the decision-making and developmental process, is bound to fail in producing any visible, and lasting positive impact on their lives.

Indeed, the book has successfully demonstrated that political will and determination is an absolute necessity to achieve the stated goals. Take for example, the health transition achieved in Nicaragua during the Sandinista period (1979-90). Health was accorded a high priority on the Sandinista political agenda, despite differences among different Sandinista leaders as to the thrust to be given to the overall policy. Equity and community participation were of utmost importance to the Sandinistas and fitted with their political values and health objectives. Conflicts with the Contras (1982-88), while it damaged or destroyed several health centres and hospitals, led to greater political commitment to devising ingenuous means to use more efficiently the available resources for meeting the health care needs of people.

The success of the Indonesian family planning programme is yet another example of how with political will health programmes can be made an integral part of a national developmental strategy. The need for such an integrated view has been reiterated well in the recently submitted report of the Swaminathan Commission on Population Policy: "A holistic and comprehensive approach should be adopted to health... If our population policy goes wrong, nothing else will have a chance to go right."[1] There are many lessons to be learnt from the Indonesian family planning movement First, acceptors

of FP methods were never offered incentive payments In fact, the Indonesian government carefully avoided falling into the 'incentive trap' Sterilisation was never forced and only those who have had the desired level of family size adopted permanent methods Another important aspect of the Indonesian FP movement was that it was slowly integrated with nutrition programmes The so-called FP programme went 'beyond family planning', and has been run as integrated service-delivery post (now renamed as 'posyandu') Family planning should go beyond mere quantitative demographic and clinical issues "true family planning', as Haryono Suyono, Lukas Hendrata and Jon Rohde say in their essay, "is both vital for bringing about changes in the nation's value systems and norms which are essential to development, and has broader socio economic implications" The success of any FP movement also depends upon "facilitating people's choice of contraceptives through a communication strategy rather than on the basis of an assessment of demographic impact of various family planning methods" There is a need to make health programmes everybody's business and the centre of the development agenda

The goal of reaching health for all, irrespective of the time frame, also poses a different kind of problem this concerns the challenges and frustrations faced in incorporating 'scientific findings' into international and national health policy Alfred Sommer's essay gives a graphic account of the intense controversy on the importance of vitamin A in reducing childhood mortality, illustrating the difficulties encountered in framing public policies As Sommer puts it

> To affect policy decisions particularly if these require alteration of previously held concepts and practices requires a good deal more evidence than would ordinarily be necessary simply to establish an esoteric scientific 'fact While the weight of evidence from laboratory, clinical trials and controlled community studies has demonstrated the mortality reduction impact of adequate vitamin A in deficient populations it remains to be seen how many more studies, meetings and workshops discussions amongst experts data and evidence will be necessary before consensus emerges and wide scale action is taken to eliminate unnecessary deaths and illness from vitamin A deficiency

The central message of Sommer's account of vitamin A story is that when policy changes are contemplated and when they have major financial implications, a large mass of evidence under various conditions to establish a simple fact' is essential The lesson is that we need to adopt and apply more rapidly proven effective interventions, not merely for the sake of saving material resources but for the sake of saving the lives of millions of helpless people

For any health care policy to be effective it is necessary to have a continuous process of assessment, analysis and action This Triple-A cycle, as Jonsson, Ljungqvist and Yambi emphasise as being the basis for the success of the nutrition programme in Tanzania, should be monitored with the help of community participation The thrust of any programme, in fact, should be to empower households and communities This can be accomplished only by mobilising people to participate in the planning, implementation and monitoring of programmes And communities, with commitment of the leaders, will be interested in participating in such endeavours

For every choice made there is an opportunity cost The debate on "compre hensive versus selective care" has been rather sterile, and will continue to be so so long as the debaters assume the centrality of health services in the determination of health Comprehensive or not programmes should be relevant to the needs of the people and should promote access to health care While comprehensive primary health care, as the essayists in this volume rightly point out, should be the ultimate goal, it is necessary to be selective and focus on segments that suffer most

In any community-based project the issue of balancing between equity and efficiency will arise There is no manual to arrive at such a balance It must be evolved subject to specific local conditions and needs This book offers the experience of how various (poor) countries have been trying to achieve such a delicate balance While Indian leaders continue to believe or rather expect the masses to believe that they will soon fulfil their promises "health for all in India is a dream which will take decades to realise" as Meera Chatterjee concludes in her essay on the evolution of Indian health policy during the last two decades

The book under review is well conceived and should be of general interest and not merely to the policy-makers in the government More importantly, it is for those who are yet to be convinced that much can be accomplished even with the meagre resource available, provided there is a will and co-operation among the people As Antony Klonda puts it in his essay "The experiences described show what can be done with services already in existence Each one of us can help donors, governments, trainers and service providers support such change"

This volume of essays is contributed by experienced administrators, researchers and consultants, all 'outsiders' and observers of the developments and the people they talk about The editors should have included an essay or two by some 'activists-researchers' on their experiences in mobilising people's participation in health care projects A book of this kind which is also expected to serve as a guidebook for designing training programme should also give some space for recording the experiences of the so-called 'insiders', that is, the activist-researchers, and community leaders who were responsible for whatever transformations their communities have witnessed [2]

Notes

1 From the excerpts of the report of the M S Swaminathan Expert Group on National Population Policy and Social Development Commission *The Hindu* May 26 1994 p 6

2 For an impressive collection of stories of various community based health and developmental projects and the role of NGOs the reader should refer to N H Antia and Kavita Bhatia (eds) *People s Health in People s Hand A Model for Panchayati Raj* (Foundation for Research in Community Health Bombay 1993) In fact it would be of immense value to everyone concerned to read this book along with the book under review

Modes of History Writing

New Hindu History of Ayodhya

Gyanendra Pandey

The right-wing Hindu movement of the last decade or so has done all it can to promote an alternative account of the history of Ayodhya and its association with Ram While this new account is in line with much of the modern Indian effort since the 19th century to establish the historicity, rationality, masculinity—in a word, 'adulthood' in western terms—of India and its religion(s), it carries very much further the positivism and literalism inherent in the understanding of modernity that has informed that tendency

From the standpoint of modes of history writing, there are two points of special interest in the new version of the story of Ayodhya The first is that it claims to be history*—in a way that popular Hindu tradition (and Gandhi) would never have bothered to do The second is that this history is fundamentally* ahistorical*—in that it allows for no change or development in the character position interests behaviour (shall we say, the history?) of its several protagonists*

THERE is a sense in which the popular Hindu account of the history of Ayodhya has been completely transformed in recent years or at least much effort has been put into engineering such a transformation Perhaps the distinguishing mark of an earlier Hindu account of this history was its metaphorical quality Ayodhya was a metaphor as Ram was a metaphor that stood for much more than the literal truth of the existence of a particular man/god or the geographical location of his capital [1] Indeed as Mohandas Karamchand Gandhi (for one) emphasised time and again in matters of faith that literal truth' was beside the point [2]

That earlier account of the story of Ayodhya has hardly disappeared altogether Fortunately India is too large too rich and too contested a country to allow for any such easy conquest of different forms of knowledge But the right-wing Hindu movement of the last decade or so has certainly done all it can to promote an alternative account of the history of Ayodhya and its association with Ram While this new account is in line with much of the modern Indian effort since the 19th century to establish the historicity, rationality masculinity—in a word, 'adulthood' in western terms—of India and its religion(s),[3] it carries very much further the positivism and literalism inherent in the understanding of modernity that has informed that tendency

For the purpose of an investigation into different modes of history writing, there are two points of special interest in the new version of the story of Ayodhya The first is that it claims to be history—in a way that popular Hindu tradition (and Gandhi) would never have bothered to do The second is that this history is fundamentally ahistorical—in that it allows for no change or development in the character, position, interests, behaviour (shall we say, the history) of its several protagonists

As 'history , this account of the past and present of Ayodhya portrays itself as the real, and comprehensive, truth This is of course a claim that it shares, more or less, with all modern histories [4] Yet it is perhaps necessary to say that professional historians all over the world today—and even in India—appear to be a little more circumspect than the new Hindu historians in their claims to Truth and Knowledge The verities of 'fact' seem to be reinforced in the latter case by the certainty of faith and all of it comes to be represented in a scientific precision—of numbers, of dates of geographical location—testifying to the literal truth of this 'history' Let me try to illustrate this through an analysis of some of the histories of Ayodhya put out by Hindu propagandists in recent years

II

The arrogation of 'scientificity' and truth' starts with the very titles of these histories Here are three of them, from a long and repetitive list *Shri Ram Janmabhumi Sachitra Pramanik Itihasa* ('An Illustrated and Authoritative History of Shri Ram Janmabhumi' the booklet itself provides the translation as 'An Illustrated and Authentic History', and the 'authenticity' is underlined by the announcement that the author has an MA and PhD in Archaeology and History), Ayodhya 1986, *Shri Ram Janmabhumi ka Pramanik Itihasa* ('The Authoritative/Authentic History of Shri Ram Janmabhumi') date and place of publication not given, *Mukti Yagya Shri Ram Janmabhumi ka Sampurna Itihasa* ('Sacrifice for Liberation The Entire History of Shri Ram Janmabhumi'), Ayodhya, 1991

The importance attached to numbers, and the unchanging quality of the protagonists in this history is illustrated by the sequence of events (or 'chronology') that makes up the core of these works This chronology appears as follows, with only slight variations of dates and numbers as between different accounts

(1) 9 00 000 years ago—Birth of Ram hence of Ram Janmabhoomi, i e, the birthplace of Ram (RJB)
(2) 150 years BC (Greek and Kushana Times)- Battle to liberate RJB
(3) 100 years BC—Vikramaditya's re discovery of RJB and construction of grand RJB temple
(4) Salar Mas ud s time—2 battles to liberate RJB
(5) Babar's reign—Destruction of temple construction of mosque—4 battles to liberate RJB
(6) Humayun's reign —10 battles to liberate RJB
(7) Akbar s reign—20 battles to liberate RJB
(8) Aurangzeb's reign—30 battles to liberate RJB
(9) Sa'adat Ali of Avadh's reign—5 battle to liberate RJB
(10) Nasiruddin Haidar's reign—3 battles to liberate RJB
(11) Wajid Ali Shah's reign—2 battles t liberate RJB
(12) British rule—2 battles to liberate RJB (1912 and 1934)
(13) 1857—Attempted compromise between Hindus and Muslims over RJB (thwarted by British machinations)
(14) December 1949—Appearance of Ram (in the form of the infant, Ramlala), an installation of images of Ramlala, inside the mosque Building locked by administrative order to maintain the peace
(15) 1986. Opening of locks on Babri masjid RJB temple

[Source Pratap Narayan Mishra *'Kya Kah Saryu Dhara'? Shri Ram Janmabhumi* I *Kahani* (1st published 1987 2nd edition Lucknow 1990) Appendix p 144

To the battles listed in this appendix I have added Events 1 and 3, and numbers 13 15 [w]hich appear regularly in these histories of [A]yodhya The date of event 3 varies being [e]ven as late as the 5th century AD in Radhey [Sh]yam Shukul's *Sri Ram Janmabhumi Sachitra, Pramanik Itihasa* (Ayodhya 1986) which identifies 'Vikramaditya' with the Gupta king, Skandagupta, who ruled at Pataliputra (modern Patna) from 455 to 467 AD]

It is notable that this chronology, based on one of the earliest in the new series of Hindu histories of Ayodhya published since the mid-1980s, a booklet which is explicitly acknowledged as the source of some of the later accounts, gives a total of 79 battles fought by 'the Hindus' for the 'liberation' of the Ram Janmabhoomi The magic number was, however, subsequently fixed at "76", which is the number of battles supposedly fought since the time of the Mughals, with whom the history of Muslims in India is readily equated The battle for the 'liberation' of the RJB that was launched in the mid 1980s was, therefore, always referred to as [t]he 77th

The point of this history is to enumerate [t]he many occasions when 'The Hindus' have [r]isen in defence of the Janmabhoomi, and [t]o catalogue their enormous sacrifices The [o]pening pages of another early publication [i]n this series, *Ham Mandir Vahin Banayenge* [5] illustrate the argument very well indeed The first chapter appears under the rubric 'Lakhon [la]kh chadhe jis thaon Shri Ram Janmabhumi [k]a itihasa—Amar balidan-gatha' ('Where [l]akhs of lives were offered up The history [o]f Shri Ram Janmabhumi—a saga of eternal [s]acrifice') Above the title on the title-page, [th]ere is a note saying that 77 battles have [b]een waged and 3,00,000 lives sacrificed by [th]e Hindus for the protection and liberation [o]f the Ram Janmabhoomi mandir (or temple)

The first paragraph of the history set the [to]ne of the narrative that follows After a [st]atement on the antiquity of Ayodhya town, [th]e text says

> Foreign aggressions on Ayodhya also have a very ancient history The first aggressor was the notorious King of Lanka, Ravana, who destroyed Ayodhya during the time of the ancestors of Shri Ram Ravana's death, along with his entire family, at the hands of Shri Ram is a story known all over the world
>
> In history, the second external attack upon Ayodhya was by the Greek king Milind or Mihirgupta (Menander), who was the first aggressor to have destroyed the Shri Ram Janmabhoomi temple But Indian pride arose to punish this irreligious foreigner for his evil deed [*dus-sahasq*, literally 'misguided (or foolish) bravery'], and within 3 months Raja Dyumatsena of the Sunga dynasty had killed Milind in a fierce war and again liberated Ayodhya
>
> The third aggressor to attack Ayodhya was Salar Masud, a nephew of the notorious Muslim plunderer, Mahmud Ghaznavi Destroying temples as he went along, Masud reached [the environs of] Ayodhya and destroyed temples in the vicinity But the united strength of the Rajas of Ayodhya and the surrounding areas and the attacks of the 'sadhus of the Digambari 'akhada' prevented his conquering army from entering Ayodhya He then moved to the north, but in 1033 AD 17 local Rajas led by Raja Suhail Dev surrounded that beastly irreligious tyrannical plunderer in Bahraich, and sent the entire invading army to their graves After this, all of Mahmud and Masud s successors were also beaten and driven from the country
>
> The next plunderer who attacked Ayodhya with the object of destroying the Shri Ram Janmabhoomi temple was Babar This ungrateful plunderer [ungrateful in that he had been given refuge food and shelter by people in different parts of India] responded to India s native tolerance and hospitality by ordering his Commander in Chief Mir Baqi, to destroy the huge palatial Shri Ram Janmabhoomi temple that had stood in Ayodhya since Vikramaditya s time in order simply to please two evil Muslim 'faqirs But the people [the country] rose in fierce opposition to this vile attack on their national honour The historian Cunningham writes 'At the time of the destruction of the Janmabhoomi temple the Hindus sacrificed everything and it was only after 1 lakh 74 thousand Hindu lives had been lost that Mir Baqi succeeded in bringing down the temple with his cannons " [6]

Through the many recensions of the Hindu history of Ayodhya, it is this story of 'foreign' aggression and native valour of eternal Hindu activism and sacrifice, that is endlessly repeated Context—the very heart of the historian's discipline, as one might suggest—counts for nothing I shall return to this point Before that, it may help to say something more about the importance of numbers, statistics and dates in this Hindu history

Numbers appear to be of critical significance here for their suggestion of statistical accuracy and historical precision "76 ' (or "77" or "79" as the case may be) battles fought for the 'liberation' of the RJB, the 700 soldiers of Babar's army that Devi Din Pandey accounted for, with his sword alone and in the face of a constant rain of bullets, in just three hours (which, according to the Hindu account, Babar himself testifies), and, further, of Devi Din's inevitable offering of his own life in this process "On June 9, 1528 AD, at 2 p m, Pandit Devi Din Pandey breathed his last" [7] They also represent, I would suggest, the 'excess' that charactertse all nationalist narratives Hence Devi Din Pandey's "700" victims in a span of "3 hours", or the 1,74,000 Hindu lives sacrificed before Mir Baqi was able to bring down the temple, or the "hundreds" of monkeys who attacked the Mughal camp one day during the same period, engaged the soldiers in battle for several hours, and silenced their guns and cannons,[8] or the '10,000 tong-wielding ('chimtadhar') sadhus, who worsted Aurangzeb's army "with their tongs alone", or, to take a non-numerical example, the "indescribably beautiful" Rani Jairaj Kumari, who formed a band of several hundred (or several thousand) women guerillas to attack the Ram Janmabhoomi on numerous occasions through the reigns of Babar, Humayun and Akbar

What is being proposed, though not demonstrated, by the Hindu historian here, is the concreteness, the almost palpable truth of this history This concreteness is sought to be represented in another, rather more literal, way as well The Hindu history of Ayodhya, it will be clear by now, is not a history of the region, much less the people, of Ayodhya It is not even about a spot now called the Ram Janmabhoomi, it is about a building on that spot This entire history is focused on a monument, which we can, for the moment, designate the 'grand temple' built (and re-built) on the site of Shri Ram's "birth" Everything revolves around this monument The narrative begins with the destruction of the monument, and returns to this point again and again Two paragraphs that appear as a 'preface' in one edition of *Shri Ram Janmabhumi ka Romanchkari Itihasa*, and as 'postscript' in another,[9] illustrate the proposition very well indeed

I quote the first line of the first paragraph, which is headed 'The Hindu Signs at the Janmabhumi' "Several Hindu features remained when the temple was demolished and given the form of a mosque these are features that Babar was forced to retain because the walls [of the proposed mosque] kept falling down on their own "

The second paragraph, headed 'The Pillars of Black Touch-Stone', reads as follows

> The ancient Shri Ram temple was built on 84 black touch stone pillars These had been constructed by King Aranya of the Surya dynasty Ravana defeated Aranya in battle and carried the pillars away [to Lanka], from where they were brought back to Ayodhya by Shri Ram after his victory over Ravana The [Babari] masjid was built upon these very pillars, upon which the aforesaid images [of Hindu gods and goddesses] can still be seen, along with inscriptions of Maharaja Aranya, Ravana and Lord Shri Ram on some pillars Of the 84 black touch-stone pillars, 11 are in the Babari masjid, 2 at the entrance to the mandir [i e, the same masjid] and [another 2?] at the [nearby] grave of Kajal Abbas [one of the Muslim 'faqirs' said to have incited Babar to demolish the Ram Janmabhumi temple], and some are adding to the glories of the museums in Lucknow, Faizabad and London

What follows, in every account published in the last few years, is a longer or shorter

description of battle after battle fought by the Hindus to 'liberate' the site, remove the mosque, and rebuild the grand temple: "76" battles before the current one which is the 77th. The monument, one could say, is the history.

This marks a significant change from earlier histories of the Ram Janmabhoomi, the Krsna Janmabhoomi and so on, examples of which may still be found in Mathura. Here, at the site of the claimed Krsna Janmabhoomi, the pulp histories that are sold concentrate on the life of Shri Krsna; and stories associated with his exploits as a child and an adult are presented alongside a fairly bland account of the several temples built at various nearby sites, the destruction by Aurangzeb of the last 'grand' temple, and the establishment of organisations to promote the worship of Krsna in Mathura and improve facilities for pilgrims, Indian and foreign.

Traces of a somewhat more 'open' and 'tentative' history of Ayodhya may also be found in some of the earlier publications associated with the latest round of Hindu agitation for the 'liberation' of the Ram Janmabhoomi from the mid-1980s. These begin with attempts to describe the grandeur of the 'ancient city', as presented in the Valmiki *Ramayana* for example, and acknowledge the gaps in our knowledge of this history—the difficulty of establishing who the 'Vikramaditya' of tradition was and how he 'rediscovered' Ayodhya; the fact that Ayodhya was built many times and many times fell into ruin; the long periods when the city had little habitation or activity (down even to the so-called 'Muslim' period).[10]

No such tentativeness or uncertainty is to be found in the 'mature' Hindu history contained in works like the *Romanchkari, Rakt-ranjit* or *Sampurna Itihasa*.[11] The 84 black stone pillars, straddling the world from the age of Ram (and even earlier) to the age of colonial and post-colonial museums, capture the spirit of this history as it is evoked by the most recent Hindu historians of Ayodhya: its antiquity, its beauty and solidity, its destruction, and its continued existence.

It goes without saying that the 84 pillars stand for much more than a town called Ayodhya: they stand for the Ram Janmabhoomi, for Hinduism, for the Hindu spirit and culture, the Hindu people, the nation. Ayodhya, or should we say the black stone pillars, are a symbol ('pratik') of the 'eternal', 'undefeated' ('Ayodhya'—that which cannot be defeated) Hindu nation. This is why this history refers constantly to the religious and national spirit of the native Hindu ever engaged in battle against the 'irreligious, foreign invader'; the 'Hindu kings who graced the throne of India [Bharat] in the centuries [even millennia] before Christ'; the united struggle of kings, sadhus and the common people (Hindus) against any insult to the national honour—meaning almost always, in this case to the Ram Janmabhoomi.

Interestingly, however, the recent Hindu history of Ayodhya—which may also be described as the Hindu history of India—is not about the construction of the Ram Janmabhoomi temple. It is about its destruction. To that extent, it is a history, not of the temple but of the mosque built upon its ruins, not of 'the Hindus' but of 'the Muslims'—or, to be more precise, of the evilness of 'the Muslims'.

It is notable that the 'construction' of the ancient temple is not mentioned in most versions of this Hindu history, it is simply assumed; and that of Vikramaditya's 'grand' temple never detailed (though his rediscovery of the site is). What is detailed is the 'destruction': how long it took, at whose hands it occurred, with what subterfuges and difficulties it was accomplished, and what features were left standing.

Even more significantly, the number of battles fought for the 'liberation' of the Janmabhoomi is fixed at "76", which by the Hindu historians' own account is the number of battles fought for the liberation of the site since the time of Babar. The battles fought before Babar's time and listed by some early Hindu historians, including the two battles supposedly waged to fend off the invasion of Salar Mas'ud Ghazi, do not count in the end, for this is in fact a history of the mosque and attempts to obliterate it. It is no accident, then, that so many of these histories should begin their account of the history of Ayodhya with a statement of the 'Hindu' signs still to be found in the mosque (that is, until its destruction on December 6, 1992), or that the volume entitled *Shri Ram Janmabhumi ka Sampurna Itihasa* ("The Entire History of the Shri Ram Janmabhumi') should add on its inside cover 'from 1528 AD to today'.

If the monument constitutes the history of Ayodhya/India, and the monument is in fact a mosque (by whatever name it may be called: 'mosque', 'temple', 'disputed structure'), it follows that the Hindu account is very close indeed to the colonial account of the Indian past. At this point, then, we return to the other major feature of Hindu history that I have underlined: its ahistorical character. It is a feature that sets this history quite apart from the general run of academic histories today, and brings it in line not only with nationalist accounts in the past, in India and elsewhere, but even more strikingly, with some of the most racist and arrogant European colonial accounts of the histories of subject peoples in Asia and Africa.[12] The parallel is all the more noteworthy because Hindu history asserts its claims to truth in India today in large part on the ground that it is an 'authentic' Indian history, as distinct from the slavish imitation of western histories produced by deracine scholars ensconced in privileged positions in the universities and research institutions of the subcontinent.

The very notion of fixed, pre-determined and unchanging 'national' cultures and histories is imperialist in its inspiration. Like the colonial account of the 'native', the new Hindu history denies the natives of India a history. As in the colonial version of the Indian past, 'Hindu' and 'Muslim' here too are fully constituted from the start, and the history of India for centuries prior to the coming of the British becomes nothing but a history of perennial Hindu-Muslim conflict. As the colonialist account had it, "the animosities of centuries are always smouldering beneath the surface".[13] Or again, "the antagonism [between 'Hindus' and 'Muslims'] though generally latent, every now and then breaks out into fierce strife..."[14]

Every major 'riot' or 'war', every conflict of importance in the pre-colonial period is reduced to a fight between Hindus and Muslims, fought in fixed ways over fixed issues at fixed sites. Hence the strife of 1912 and 1934, which has been detailed in the British colonial records, involving conflicts between Hindus and Muslims on one occasion in, and on the other near, Ayodhya, become 'wars' over the Ram Janmabhoomi in the Hindu account: precisely as, for the British too, they could at bottom be no different from any other Hindu-Muslim 'riot' in Ayodhya.[15]

The differences between the colonial account and the Hindu account are minor, but should be noted. What are 'riots', 'convulsions', symptoms of a disease for colonialist writers, are 'wars' for the Hindu historian (though it must be said that many colonialists were happy enough to describe Hindu-Muslim conflict as 'religious' or 'national' wars). 'Wars' have their 'heroes', which is something that cannot always be said for 'riots'. For colonialist historiography, consequently, Hindus and Muslims were villains, or 'beasts', uniformly—with rare exceptions. For the Hindu historian, however, 'the Muslim' is congenitally evil, narrow-minded and bigoted, whereas 'the Hindu' is tolerant, hospitable, accommodating but also—when pushed to the limit—capable of fighting back all too effectively: and Hindu history quickly runs up a long list of Hindu heroes and Muslim villains (joined occasionally by Hindu villains) who have littered the Indian past.

Continuous 'wars', 'riots', 'convulsions'; between men who are like beasts, or 'heroes' and 'villains' respectively; for the 'liberation' of the Ram Janmabhoomi, or merely for the thrill of turbulence: it is a dismal history, scarcely deserving of the name.

III

Before we conclude this analysis, there is one other aspect of the new Hindu history of Ayodhya that needs to be considered. What we are dealing with here is clearly no ordinary, academic history—as anyone who has the slightest acquaintance with the pamphlets and booklets retailing it knows. These pamphlets and booklets are sold (or distributed) at pilgrimsites, along with images of deities, religious calendars, prayer-books and the like—and bought, perhaps, as often for the decoration of a household shrine, or prayer-room, as for reading individually or in groups. They are prefaced or headed frequently by an 'Om', a mantra, or a longer prayer to Shri Ram. They begin in the age of Ram, 9,00,000 and more years ago, and they are marked by an easy (and, in a sense, unceasing) intervention of the divine—or, to put it in other terms, a realisation of the ineffable that lies behind the illusions of this fleeting world.

The opening paragraph of Ramgopal Pandey Sharad's *Shri Ram Janmabhumi ka Romanchkari Itihasa ('The Thrilling History of Shri Ram Janmabhumi')* illustrates the point very well indeed.

> 9,00,000 years ago, the supreme ideal of manhood, Lord Shri Ramchandraji, took on his earthly incarnation in precisely this hallowed land/area. He rolled in the pure dust of this sacred spot ... and, along with Bharat, Lakshman and Shatrughanji, thus enacted his rare and divine childhood. The Hindu rulers who graced the throne of India [Bharat] many centuries before Christ defended it [a temple? the spot?] all along. They repaired it from time to time, but at the time of the Kiratas and the Huna invasions, they turned their attention away from the site. As a result, the ancient temple [n b this is the first mention of the temple] was destroyed and no trace of it remained. In the end, a century or so before Christ, the shining light of the Hindu family Emperor Vikramaditya, rediscovered the site after great effort and constructed a grand temple at the sacred spot.[16]

Given all of this, it may be objected, it is we who are being literal, in treating as literal history something that is in fact a larger, symbolic, mythic statement. The objection is important and requires discussion at some length.

It would be foolish to deny that the Hindu Right has 'played', and played to a large extent successfully, with multiple notions of 'religion', 'culture', 'politics', 'myth' and 'history'. 'Hinduism' is not a religion, we have been told time and again. It is the way of life, the manner of being, of people living in this part of the world. Ram is not a 'religious', but a 'national' hero. The Ram Janmabhoomi 'liberation' movement is not a political, but a religious movement—or the other way around.

Hindu history, like Hindu politics, has thrived on this 'play'. It has moved unapologetically between the divine and the mundane, and the wondrous has come to be easily mixed with the 'scientific', so-called. Thus, to take the most recent chronological examples first, Hindu history tells us of the miraculous appearance of the infant Ramlala inside the Babri masjid on a cold December night in 1949, attested to (in the Hindu account) by the Muslim policeman who was there on guard duty. We also have Ram, "unable to bear the suffering of his bhaktas (devotees) any longer", intervening through a local lawyer and a local magistrate in Faizabad to have the locks on the mosque/temple opened in 1986. There is evidence of divine intervention again in November 1990, when a number of *kar sevaks* "miraculously" scaled the Babri masjid and attained the heights of the domes in a matter of moments (a feat, we are told, that took the trained commandos at the site, with all their equipment, over half an hour to accomplish),[17] and when a large monkey appeared and sat for a long time on top of the central dome, with the bhagwa dhwaj (saffron flag, emblem of the Hindu movement) in 'his' hands: veritably, we are told, this was the monkey-god, the greatest Rambhakta of all, Hanuman himself.

The sequence of divine intervention began, of course, a long, long time ago. In historical times, its first startling manifestation occurs at the time of the Emperor Vikramaditya who "re-discovered" the Ram Janmabhoomi. As the Hindu account has it, a tired Vikramaditya, accidentally separated from his companions, was resting by the river Saryu to regain his breath when he saw a handsome black prince, dressed from top to toe in black and mounted on a black horse, enter the river. When the horse and rider came out again a few moments later, an amazing transformation had taken place: the prince's mount, his clothes, his face, were now all shining white.

Overwhelmed, Vikramaditya went up to the strange prince and asked him to explain the meaning of this 'vision'. The prince explained: "I am Tirthraj Prayag [the pilgrimage centre, Prayag or Allahabad, personified]. Every year [at a certain time] I come with the countless sins I have taken onto myself from the millions of pilgrims who come to cleanse their sins at Prayag, and these are washed away by the Saryu." (which, therefore becomes even more efficacious than Prayag as a site of pilgrimage and a step to salvation). Asked for further advice and guidance, Tirthraj Prayag tells Vikramaditya to re-establish the Ram Janmabhoomi. Aided by signs and measurements told to him by Tirthraj, Vikramaditya rediscovers Ayodhya, establishes the exact site of the Janmabhoomi by setting free a cow newly delivered of a calf (milk begins to flow automatically from her udders as soon as she reaches the sacred spot), and builds there a grand temple on the 84 pillars of black touch stone.[18]

The subsequent history of the Ram Janmabhoomi is in line with this half-human half-divine, 'neither this nor that', scenario—as indeed a history of Hindu divinity well might be. The point is illustrated dramatically by the difficulties experienced by Babar in converting the temple into a mosque. After Babar had overcome 'the Hindus' in a battle that lasted long and furiously, and in which the Mughal forces were beaten back time and again, he left Ayodhya instructing his lieutenant, Mir Baqi Khan of Tashkent, to build a mosque on the site of the temple using the very material of the latter. But this proved to be no easy task. "The walls that were built during the day came down [as if by miracle] at night", and this is what continued to happen day after day,[19] until Mir Baqi in despair urged Babar to return and see things for himself.

Babar returned, and seeing what each day brought, consulted local sadhus and arranged a compromise which gave him a way out. The sadhus said that Hanuman was against the construction of the mosque, and no building could occur until he was persuaded. In the end, as (according to our Hindu historians) Babar himself has written in his memoirs, the Hindus laid down five conditions: "The masjid was to be called 'Sita Pak' [i e, Sita's rasoi or kitchen]. The space for circumambulation around the central structure [parikrama] had to be preserved. A wooden door was to be erected at the main entrance. The turrets/spires were to be brought down. And Hindu mahatmas were to be allowed to conduct prayers and recitations." Every one of these conditions negated the concept of a masjid, according to this Hindu account.[20] Thus, it was not the Hindus but Babar who had ultimately to surrender. Even in the form of a mosque, the RJB remained a temple. Even in defeat the Hindus were (as, implicitly, they always will be) victorious.

One might suggest that a sense of eternal (and united) Hindu activism and sacrifice, of enormous numbers (which testify again to Hindu strength), and of a divine 'play' or 'order' (once again revealing the power of the Hindu'), actuates the Hindu history of Ayodhya. 'Hindu' and 'Muslim' occupy interestingly different subject-positions in this history. The 'Muslim', 'foreigner', 'invader' and 'irreligious being', readily seen as being scheming, greedy, lustful and bigoted, is fully to be blamed for 'his' actions (women figure, on both Hindu and Muslim sides, merely as property: extraordinary cases, like that of Rani Jairaj Kumari, are after all extraordinary). The Hindus, on the other hand—rajas, taluqdars, sadhus and even

ordinary villagers—are all part of the divine, they do no more than serve a divine purpose and are, in that sense, not responsible for their actions In that sense, too, they can never be defeated, according to the canons of Hindu history

The different subject-positions occupied by 'Hindu' and 'Muslim' point to the vexatious interpenetration of different orders of time that takes place in the Hindu account. The 'construction' of the original Ram Janmabhoomi temple, and its 'destruction', represent the quintessence of these different orders, different histories—the divine and the mundane From the time of Shri Ram (and even earlier), which can scarcely be described, which is beyond human time, to the ossified exhibits of colonial museums, divine time runs into historical (and archaeological) time Hindu history is quite untroubled by this colossal chronological span, or by the huge gaps in it say, between (1) and (2) in the chronological table given at the beginning, or on an altered, 'modern historical time-scale between (3) and (4), or in the greatly accelerated chronological arrangements of contemporary history, between (13) and (14)

There is indeed a timeless, epic quality to this history, in its proposition of beginnings that are not beginnings, destruction that is not destruction, in the circular character of the narrative, which returns to the same point again and again and again, and in which nothing changes and in its suggestion that those participating in the 'liberation' war against Babar (or against 'pseudo-secularists', which is the name given by the Hindu right wing to all those who oppose them in India today) are one with those who joined the war against Ravana What the account does is to atemporalise events Even the enumeration of battles fails to change this aspect of the narration While enumeration usually implies linearity, the enumeration here has no such logic attached to it It might be either random or entirely self-contained, and it does not necessarily "grow" The "76" battles do not move to different ends, not even somewhat different ends, but are in the end all the same

The curious mixture of cyclical time and instrumentality found in these accounts has the structure of a rudimentary fable, where all events ultimately point one way However, the collision of times is striking Remote, golden, happy, overturned by a mythic cycle of bloodletting, savagery and valour, disrupted into linearity once again by the possibility of an 'end'—today Mythic time schemes leak into positive, historical, realist time And Hindu history insists on the literal truth of its assertions at this precise spot, and not a yard this way or that, was the Lord Ramchandra born Marked by what Koselleck has called the "self-accelerating temporality" of the 'modern',[21] epic time turns back upon itself and devours itself in the demand for a final resolution of a mythical conflict now.

The 'Muslim invasion' (equated frequently in Hindu as in colonialist historiography, with the rule of the Great Mughals, and dated to 1528—for Babar's attack on the RJB is the central motif) and 'Indian independence' (the appearance of Ramlala in 1949 being the sign of this) are the two precisely dated historical events around which the discourse of Hindu history and Hindu politics turns At one pole is Babar, the foreigner and invader, and with him all Indian Muslims—the progeny of that invader (Babar ki aulad), a blot on India's history (not unlike the Babri masjid, as Hindu propagandists might have said) At the other end, this history is animated by the 'continued slavery' of India (and especially of India's westernised ruling class) even 40 years after formal independence, which does not allow 'us' (the Hindus that is, the nation, those same propagandists tell us to build a temple at this, our' most sacred site, in 'our' own country—the only Hindu country in the world [22]

In the end then, the Hindu account belies its own pretensions to epic status If the epic tradition is distinguished by the absence of beginnings, middles and ends, and of unidirectionality, by the refusal to privilege a single point of view, and by the problematising of the 'good' and the 'bad' Hindu history departs radically from it Indeed it is, in many senses, closer to the worst kind of melodrama—where Good is Good, and Evil is Evil, a thief is a thief, and that is all there is to that Curiously, too, given the all-embracing character of Hindu philosophy, and the fact that Ravana himself is assigned a 'divine' status, seeking his death at the hands of Ram so that he might become one with the Eternal, this modest status of being a small part of infinity is not accorded to the Muslims—not even to those who were 'converted' from pre Islamic religious traditions in India and against whose forced conversion' the Hindu right has raised such a hue and cry

There is a modest, local history of a weaving qasba in northern India dating from the late 19th century which I have analysed elsewhere, [23] which I suggested provided a real alternative to the statist colonial historiography of the time In this alternative rendition of the past, the local community is the subject of history, community honour its object of analysis The idea of the community is valorised, yet at the same time, the 'community' has no fixed boundaries, it attaches itself to different collectivities, and has multiple meanings depending upon context—and history In Hindu history, by contrast, the community ('Hindu' even more than the 'Muslim') is a clearly enumerated entity, with boundaries that are fixed from the beginnings of time and a culture and interests that are unalterable.[24] What is more, this 'Hindu community' can achieve its predetermined ends, and realise itself, only through the capture of state-power. That is, of course, the point of Hindu politics and Hindu history today. But it moves this history even further away from what it claims to be—an anti-statist 'history', giving voice to local society and the indigenous community

Notes

[An earlier version of this paper was presented at a conference on 'After Ayodhya The BJP and the Indian Political System', organised by the South Asia Research Unit, Curtin University of Technology, Perth, western Australia, in July 1993 I am greatful to the participants in that conference, and especially to John McGuire and Peter Reeves, for their comments on that draft.]

1 As Tulsidas has it in the *Ramcharitmanas*, 'Avadh tahan jahan Ram nivasu", Wherever Ram dwells, there is Avadh (Ayodhya)'—i e, even in the heart of the devotee Ayodhyakand', *chaupai* following doha 73

2 As Mahadev Desai wrote about Gandhi's attitude to debates on the authenticity of particular texts of the *Bhagavad Gita* "in the last analysis it is the message that abides, and he is sure that no textual discovery is going to affect by a jot the essence or universality of that message The same thing may be said about questions of the historical Krishna " Mahadev Desai, *The Gospel of Selfless Action or the Gita According to Gandhi* (Ahmedabad, 1946) p 6, cited in Partha Chatterjee, *Nationalist Thought and the Colonial World* (Delhi, 1986) p 94

3 The writing on this issue is now considerable see, for example, Ashis Nandy, *The Intimate Enemy* (Delhi 1983), Ranajit Guha *An Indian Historiography of India A Nineteenth Century Agenda and Its Implications* (Calcutta, 1988), Uma Chakravarti Whatever Happened to the Vedic Dasi?' in Kumkum Sangari and Sudesh Vaid (eds) *Recasting Women Essays on Colonial India* (Delhi, 1989), Partha Chatterjee *The Nation and Its Fragments* (Delhi 1993) and Sudipta Kaviraj s analysis of Bankim's construction of the figure of Krishna in his forthcoming work on Bankimchandra Chattopadhyaya See also the writings and speeches of Tilak and Syed Ahmaed Khan, *B G Tilak, His Writings and Speeches* (Madras Enlarged ed, 1919) especially his comments on the *Gita* p 231ff and Christian W Troll *Sayyid Ahmad Khan A Reinterpretation of Muslim Theology* (New Delhi, 1978) For a fascinating comment on changing traditions in iconography see Anuradha Kapur ' Deity to Crusader The Changing Iconography of Ram' in G Pandey (ed), *Hindus and Others*·

The Question of Identity in India Today (Delhi, 1993).

4 Cf James Mill's 'Preface' to the *History of British India*, "I have performed the business of research, with a labour, and patience, which it would not be easy to surpass. And I believe there is no point, of great importance, involved in the history of India, which the evidence I have adduced is not sufficient to determine"; *History of British India*, abridged with an 'Introduction' by William Thomas (Chicago, 1975), p 22.

5 *Ham Mandir Vahin Banayenge* (New Delhi, 1989).

6 Ibid, pp 10-11. It is noteworthy that while the attacks by Ravana and Milind (Menander) appear in these opening paras, not even the latter forms part of the "77" battles listed by the author as having taken place for the protection/liberation of RJB. The reference to "the historian Cunningham" is to the compiler of the Lucknow *District Gazetteer* (part of the series compiled by British officials for every part of northern India in the later 19th century), and is fraudulent, as the citations so often are in these Hindu 'histories'—in this instance because it fails to mention Cunningham's reference to unidentified 'local, oral tradition' as the source of his statement and his numbers.

7 Pratap Narayan Mishra, *Kya Kahti Saryu Dhara? Shri Ram Janmabhumi ki Kahani* (1987; 2nd ed, Lucknow, 1990), pp 67-68.

8 Ibid, p 83

9 *Shri Ram Janmabhumi ka Tala Kaise Khula. Shri Ram Janmabhumi ka Romanchkari Itihasa* (Ayodhya, nd in both cases).

10 See, for example, Radhey Shyam Shukul, *Shri Ram Janmabhumi: Sachitra, Pramanik Itihasa* (Ayodhya, 1986).

11 *Shri Ram Janmabhumi ka Tala Kaise Khula Shri Ram Janmabhumi ka Romanchkari Itihasa* (Ayodhya, n d); *Shri Ram Janmabhumi ka Rakt Ranjit Itihasa. Tala Kaise Khula?* (Ayodhya, n d); *Mukti Yagya. Shri Ram Janmabhumi ka Sampurna Itihasa* (Ayodhya, 1991).

12 Here, to take only one example, is the Rev M A Sherring writing about the history of Benares, which was in his view "to a great extent the history of India": "While its career has been of long duration, it has not been of a character to awaken much enthusiasm or admiration. It cannot be said that either the moral, or the social, or even the intellectual condition of the people residing here is a whit better than it was upwards of two thousand years ago..."; M A Sherring, *Benares: The Sacred City of the Hindus* (1868; reprinted Delhi 1975), pp 342-43.

13 Francis Younghusband, *Dawn in India* (London, 1930), p 144.

14 James Kennedy, *Life and Work in Benares and Kumaon, 1839-1877* (London, 1884), p 335.

15 For an alternative account of these two incidents, see Sushil Srivastava, *The Disputed Mosque* (Delhi, 1991).

16 *Shri Ram Janmabhumi ka Romanchkari Itihasa* (Ayodhya, nd), pp 3-4.

17 Interview with civil official, Faizabad, November 1990. Cf Sudhir Chandra and Gyan Pandey, 'Mandir-Masjid ka Sawal aur Hindu Aakraamakta', *Navbharat Times*, New Delhi, March 3, 1991.

18 Mishra, *Kya Kahti Saryu Dhara*, presents the story of Vikramaditya's 'vision' as simply a dream, and refers to other factors ("old documents") that facilitated his 'rediscovery' of Ayodhya. But the 'dream' becomes a miracle in most of the Hindu accounts.

19 Cf Mishra, *Saryu Dhara*, p 56: *Kaun si daivi shakti thi?*, (What divine power was this?...).

20 This is a standardised narrative that appears in practically the same form in every account. However, minor but interesting variations are still found. Some accounts declare that while Muslims were allowed to use the mosque/temple for "two hours a week", for the Friday prayer, Hindus could pray there at any time, *Shri Ram Janmabhumi ka Tala Kaise Khula. Shri Ram Janmabhumi ka Romanchkari Itihasa*, p 11. One account states that the mosque became a temple in the course of time "of its own accord"; Shukul, *Sachitra, Pramanik Itihasa*, p 11. Several mention the further concessions that the Muslim Nawabs of Awadh were 'forced' to make in the 18th and 19th centuries. All of this appears to be designed to reassure 'Hindus' that they have always been, they will always be, 'victorious'.

21 R Koselleck, *Futures Past: On the Semantics of Historical Time* (Cambridge, Massachusetts, 1985), p 18.

22 In terms of this statement, Nepal—a Hindu country—is either irrelevant or appropriated to the larger design of 'Hindu nationalism'.

23 Cf my *The Construction of Communalism in Colonial North India* (Delhi, 1990), p 115ff.

24 Cf in this context Sudipta Kaviraj's important distinction between the 'fuzzy' and the 'enumerated' community; 'The Imaginary Institution of India' in Partha Chatterjee and Gyanendra Pandey (eds), *Subaltern Studies, Volume VII* (Delhi, 1992).

Optimal Fuel-Mix in Rural Economy

A Village-Level Exercise

Saumyendra Bhattacharyya

Overdependence on traditional sources and non-availability of commercial energy in rural areas have resulted in low energy consumption in India. Since the rural component dominates the total consumption, only region-specific village studies can clearly analyse the constraints affecting consumption of non-commercial and non-conventional energy.

This paper estimates the total cost incurred by the rural economy of Sirsi in Jaipur district on energy consumption from a linear programming exercise by obtaining the optimal consumption pattern of energy sources subject to fulfilment of different demand and availability constraints.

I
Introduction

IN India, even when the share of non-commercial energy is decreasing, the share of commercial energy in total energy consumption is still very low. This is mainly because 'about 80 per cent of the total population have access only to traditional sources—firewood, charcoal, agricultural residues and cowdung. The modern forms of energy are accessible to the rest 20 per cent and for fuelling modern forms of technology in industry, transport, agriculture and services, etc [Bhagwan 1986]. The dependence on non-commercial sources is more acute in rural India which comprises of 74 28 per cent[1] of the total population

Moreover, the household sector consumes 50 per cent of the total gross energy consumption of India, mostly for cooking and lighting. The share is much larger for rural India, which consumes non-commercial energy sources to the extent of 80 per cent These figures, along with a relatively larger percentage of planned expenditure on commercial energy sources may largely explain the energy crisis in the rural sector. It causes a two-way impact on India's energy scenario:

(a) The use of non-commercial sources requires a larger amount of gross energy (and hence a larger amount of fuel sources) to get a given level of useful (net) energy.
(b) The supply of these sources is difficult to cope up with the increasing demand owing to their natural bounds and for environmental reasons.

Therefore, a two-pronged strategy is to be attempted (i) to provide more energy for increasing population and (ii) at the same time, to conserve energy in view of exhaustible nature of commercial energy sources and natural upper bounds and/or environmental constraints for increasing the availability of non-commercial energy sources beyond a certain extent. A possible solution is to opt for a fuel-mix which can strike a balance between the two.

Moreover, with this high level of dependence on non-commercial energy and relatively inelastic nature of consumer demand for fuel and light with respect to their aggregate consumption expenditure,[2] the planning strategy for a medium-run period, should take into account one or more of the following options—(1) the possibility of increasing the use of improved appliances with higher net (useful) energy coefficients, (2) dependence on renewable energy sources, and (3) supply of commercial energy sources

The cross-section studies across different regions of the country vary depending on variations in agro-climatic conditions, food habits, agricultural pattern, availability of different exhaustible fuel-sources and use of different non-conventional energy sources Now the availability and use of non-commercial fuel sources and supply of non-conventional energy sources can be analysed for a region-specific study which minimises the effects of agro-climatic variations, differences in socio-economic conditions, ununiform consumption patterns, etc. Herein lies the importance of a decentralised planning. So we have restricted ourselves to a village-level study.

Of the available supply of different fuel sources, the pattern of energy consumption (or needs) is mainly guided by the availability of these energy sources at cheaper private costs and by the absence of alternative fuel sources at reasonable cost. However, there are also multiple uses of some fuel sources in different activities/end-uses in household and agricultural sectors. Hence, an integrated approach, incorporating the energy requirements in different sectors, for the rural economy is warranted.

II
The Model

This rural energy system itself is a very complex one with a number of interdependent variables and parameters and to quantify them is a difficult task owing partly to non-availability of suitable data and partly to the non-economic characters of some variables. Moreover, the fuel use options inter-relate different activities/end-uses so that a shift (in fuel source) from one end-use to another leads to a change in the pattern of energy consumption in the rural economy as a whole. To understand this inter-dependence, we should look into the pattern of energy flow in different sectors in a village economy.

This research has been initiated with the premise that land-use pattern is given and so is the livestock population. This is a realistic assumption in a static framework (for a given reference year). On this basis, the energy flow has been schematically represented in the figure. It follows from the diagram, that although the total availability of each type of energy sources is given, the use of each type of fuel source in different activities is determined by the system as a whole depending upon various economic and technical parameters and more importantly on the objective function chosen.

We shall estimate the total cost incurred by the rural economy on energy consumption from a linear programming exercise. This has been done by obtaining the optimal, consumption pattern of energy sources when the objective is to minimise the total cost of energy subject to fulfilment of different demand and availability constraints

A simple model based on these considerations has been attempted here by taking two major sectors—namely, household sector and agricultural sector. Given the information regarding the pattern of energy consumption and the availability of different fuel sources, we have chosen to build up a linear programming model with an objective to analyse the cost implications of various options introduced for rural energy planning at a village level.

The availability constraints are different for different non-commercial energy sources. However, for commercial energy sources, no supply constraint has been imposed. This seems realistic as we have considered a village for which variation in commercial energy demand do not make a significant impact on the overall production of commercial energy sources in India.

To see the fuel options introduced to meet the various end-uses/activities, the demand requirement of each end-use/activity has to

be taken into account. In our two sector model, the following end-uses/activities have been considered.

Household Sector

(i) Cooking: with energy supply options—fuelwood, dung-cake, crop-residue, kerosene and bio-gas.[3]

(ii) Lighting: where fuel options are kerosene, electricity (from grid) and bio-gas.

Agricultural Sector

(i) Field Operations: Here diesel and (draught) animal power are major fuel options.

(ii) Minor (lift) Irrigation: For this, the fuel options are diesel, electricity, animal power and bio-gas.

(iii) Rural Transport: with supply options—diesel and animal power.

Two end-uses—(a) bio-gas plant and (b) fodder have also been taken into account. For example, bio-gas plant requires cowdung to produce bio-gas and manure. As cowdung can be used both for cooking (in dung cake form) and in bio-gas preparation (in wet form), bio-gas production can be changed by changing the cowdung availability for bio-gas preparation. The trade-off for cowdung use in bio-gas preparation and in cooking has thus been incorporated in the model.

Similarly crop residue is needed for both cooking and maintenance of livestock population. Thus a trade-off exists here too. An increase in crop residue use in cooking causes a decrease in the crop residue availability to maintain livestock and the village has to purchase fodder from outside.

This model is based on the following assumptions:

(a) The objective function and the constraints are assumed to be linear. This rules out any significant economies of scale with reference to activity levels relating to production, transportation and end-use of different forms of energy. However, this seems realistic in a medium-run reference period in which a significant technological change is improbable.

Owing to various interlinkages, same fuel source is used for different activities/end-uses. We shall, however, take into account only the direct uses of the energy sources.

The fodder intake along with its quality, agro-climatic zone and nature or breed of draught animals determine the productivity of the draught animals in agriculture and the number of hours for which it can work. Owing to lack of region-specific data, it is assumed to work 1,500 bullock-hours/year [Rajendran et al 1982].

(d) The fodder intake of and the dung availability from each type of animal have been considered as parameters [Desai 1980].

(e) The availability of dry dung (dung-cake) as well as the farmyard manure from a given quality of fresh animal dung is assumed to remain fixed in our model although it can vary depending upon the nature of animal waste. The regional variation in the case of bio-gas production and production of slurry in bio-gas plants have been neglected.

(f) The crop residues are used in cooking and as fodder only. The use of crop residues in the construction of 'kuccha' houses is ignored.

(g) All the major fuels used in an activity are assumed to be perfect substitutes of one another in that activity. For example, in cooking, any kind of special preparation requiring a particular fuel is ignored.

(h) The requirement of useful energy depends on the efficiency of each type of appliance used for an activity. We have considered only one type of appliance for each fuel source in each activity. However, in cooking, we have considered two types of appliances for each fuel source (except bio-gas) and have generated two scenarios:

(A) Scenario I: when all the cooking fuels are used in traditional appliances.

(B) Scenario II: when only improved appliances are used in cooking.

(i) The present level of consumption of fuel wood has been assumed to be the upper limit of availability of it. This is justified on the ground that the village, at present, dependent on fuel wood for cooking is assumed to collect the maximum possible fuel wood from the village or from nearby areas.

(j) Human energy has not been taken into account.

With these assumptions, we have formulated the linear-programming model with the objective to minimise the total cost of the (rural) village society in different energy sources subject to the fulfilment of energy requirements for different activities/end-uses and also to the availability of different fuel sources. A detailed description of the model has been given in Appendix.

The optimal solution of the model selects the best possible way of meeting energy needs for a particular end-use on the basis of the cost economy. It takes out the economically most viable technology to meet the requirement and looks for an alternative when it comes across a limiting constraint associated with the technology. However, two important problems crop up at this stage which are to be taken care of in our study.

(a) The cost co-efficients attached to each of the various fuel sources in the objective function incorporates both the cost of energy source and also the cost of energy-source for its end-use (or activity), i e, user's cost. In the case of the latter, the cost of appliance is to be taken into consideration. In a planning exercise, the cost of fuel source is measured by the economic costs. In this case, the costs of non-commercial fuels incorporate the cost of production, collection, transport, etc (apart from environmental cost which is difficult to measure owing to its non-economic behaviour) while the costs of commercial fuels take into account the cost of their production in India. However, in a village-level study, where the decision is mainly guided by private costs of fuel sources, incurred by individuals (e g, the market price of kerosene is much less than its economic cost), the exercise concerning these costs does not seem to be very relevant provided—(i) the results in the two exercises are very similar to one another, or, (ii) some fiscal/monetary measures can provide a check on the consumption of those fuel sources, uneconomical according to the economic cost exercise. Therefore, for a proper planning strategy, both the costs are to be taken into account. Separate exercises have been atempted to test the model with both 'financial' as well as 'economic' costs

(b) While doing such an exercise for a village-level study, the aggregate of each type of different fuel sources available is taken. For example, (a) the crop residue is dependent on total agricultural crop production, and (b) cowdung is a function of total livestock population of the village. But such exercises

Table 1: Different Categories of the People

Category	Area (hectares)
Cultivator I	less than 1
Cultivator II	1 – 2
Cultivator III	2 – 4
Cultivator IV	4 – 10
Cultivator V	above 10
Landless labourer	no land
Artisan	–

Table A1: General Information about the Village Sirsi, Jaipur District

Number of households	463	
Human population (1981)		
Male	1,732	
Female	1,484	
Total	3,216	
Area (hectares)	966.00	
Cultivable waste	14.94	< 1.50 >

Irrigated	486.00	< 0.54 >

accept the free interpersonal (inter-household) transaction as granted and ignores the asset-holding distribution of different size-class of the population in the village. For example, the crop residue, *ceteris paribus*, is proportionate to the land size and the crop residue availability to landless labourers is zero. Thus, even if crop residue emerges as the most efficient cooking fuel source (with zero private cost) in the aggregate (village-level) exercise, landless labourers have to depend on more costly fuel source to meet their cooking energy requirements. Therefore, a decentralised exercise has been undertaken for each of the asset-holding classes and get the aggregate view of the village as a whole by summing up the optimal results for all classes.

Taking all these considerations into account, let us discuss the results obtained for a village called Sirsi[4] in the district of Jaipur in Rajasthan.

III
The Data

For the study, we have primarily depended on the data obtained from a survey report: Report on Energy Consumption Pattern—A Study of North-East Rajasthan, conducted by Kanta Ahuja and U S Rathore of Institute of Development Studies, Jaipur (Rajasthan). But when the survey data has not provided us adequate information, especially relating to the capacity related parameters and technical parameters, the data from various sources have been used, namely, (1) the sectoral statistics published by the different departments of the government of India; (2) the reports of various committees/groups on the development of the different energy-related sectors in the country; (3) various articles/seminar papers published in different sources. A few gaps in the data requirements has been covered by getting information from some private institutions/organisations.

The report has classified the people of the village according to their landholding sizes (Table 1). For each individual category, we have tested our model to get the optimal consumption pattern of energy sources.

IV
The Results and Analyses

The linear programming optimisation problem developed on the basis of the model and the data has 28 variables and 50 constraints (including non-negativity constraints). The solutions are obtained for each of the cases with different cost structure by using a soft-ware package Linear Interactive and Discrete Optimiser (LINDO) while qualitative discussions of the results have been made below the quantitative results are shown in Annexure tables (see Tables A1 to A9).

Cooking

Of the five fuel options considered in our formulation, namely, fuelwood, dung-cake, crop residue, kerosene and bio-gas, commercial energy consumption emerges to be less efficient compared to others. Although the results are different for two exercises (using different costs), both of them campaign for more and more use of bio-gas for cooking in the coming future.

When financial cost is considered, fuelwood emerges as the most efficient cooking fuel. Lower transport and collection costs within the village and use of twigs, branches and leaves (and not logs) cause a lower private cost of fuelwood as compared to other cooking fuel options. Thus the economic choice of fuelwood is obvious. However, owing to its low useful energy content and as fuelwood consumption is restricted by an availability constraint, energy demand in cooking cannot be met from fuelwood alone.

TABLE A2: MAJOR PARAMETERS AND DATA FOR THE EXERCISE

	Cultivator I	Cultivator II	Cultivator III	Cultivator IV	Cultivator V	Landless Labourers	Artisans and Others	Total

Considering the cost structure of bio-gas and its efficiency (60 per cent), bio-gas comes out as the second-best alternative fuel source to meet the rest of the energy demand. It has thus been noticed that with financial cost structure, cowdung is more efficiently used as bio-gas than as dung-cake in cooking

Dung-cake, *per contra*, appears to be the most efficent fuel source if economic cost is considered because of its lower social cost In rural India, cowdung collection and dung-cake preparation are done mainly by women and children who do not have any alternative employment. Thus the opportunity cost in dung-cake preparation has been assumed to be zero and the cost co-efficient of dung-cake comprises only of the cost of its use in cooking.

As the energy available from dung-cake falls short of the total demand, fuelwood and bio-gas are used subsequently. Both bio-gas and dung-cake supply are constrained by the availability of cowdung (and hence by the livestock population) so that even when the opportunity cost of dung-cake is higher than that of bio-gas in cooking, bio-gas would be substituted for dung-cake with every increase in cooking energy demand and the share of dung-cake falls For other two options—crop residue is more efficiently used as fodder, while kerosene consumption can be reduced to zero if the required level of bio-gas can be made available

Therefore, a decentralised planning strategy to popularise the bio-gas energy[5] can be suggested in the face of rising demand (owing to increasing population pressure) and limited supply of non-commercial sources While the fuelwood use cannot be increased above a certain bound owing to environmental threats, the possibility of increase of cowdung supply has also a limited scope in the coming years given the present low rate of growth (1 per cent per annum) of the livestock population.

The optimal consumption pattern of fuel sources in cooking remains more or less the same for each individual class. However, it has been noticed that two categories of people (cultivator II and landless labourers) use kerosene which is more expensive. The ownership pattern of livestock is such that bio-gas production and fuelwood together cannot meet their energy demand in cooking. Thus these two categories, with lowest per household income among all categories, have to depend on more expensive commercial sources

The problem, therefore, lies in the basic question of property ownership Until and unless some directions towards co-operation of the village is done, the burden of costly energy use is to be borne by the poorer section of the society

An additional exercise has been attempted to see the effect of using improved 'chulhas' (in cooking) with higher useful energy contents. It has been found that the dependence on bio-gas can be decreased if sufficient amounts of fuelwood, dung-cake are available. Otherwise the consumption of kerosene would remain positive resulting in a pressure on depleting foreign exchange reserve in India.

Lighting

Three fuel options, namely, electricity, kerosene and bio-gas have been considered in lighting. The optimal solution stresses the use of electricity which accounts for 100 per cent of the total demand for this end-use, if available up to the required level. For this, the increase in cost of more electricity generation is far less than the saving from production of kerosene use. Moreover, a major part of the saving is in the foreign exchange market.

The result, therefore, recommends for rural electrification in this village so that every household can use electricity for its domestic use. According to the survey data, the number of households electrified is only 65 per cent of the total households.

The domestic sector which includes primarily cooking and lighting consumes about 92 per cent of the gross energy. The shares of cooking and lighting in the total (net or

Table A3 Estimated Figures for Cost Coefficients in the Model (including the End-use Costs)

Name of the Fuel Source	End-use/Activity	Financial Cost	Economic Cost	End-use Cost

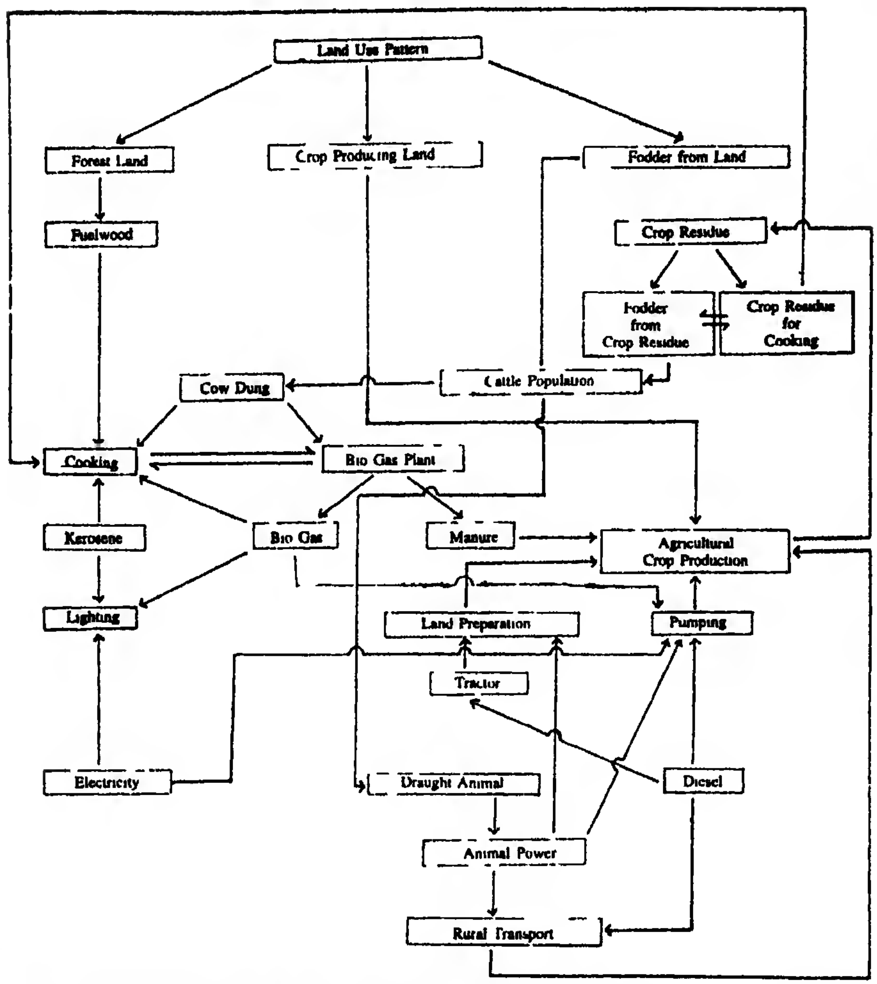
	Scenario II			Rs 0.10/cu m
	Lighting			Rs 0.65/cu m
	Lift irrigation			Rs 6.33/cu m

Notes (1) For cooking and lighting, the size of the bio-gas plant considered is 2 cu m while for lift irrigation, 10 cu m Bio-gas plant has been taken into account.

FIGURE 1: SCHEMATIC REPRESENTATION OF ENERGY FLOW



useful) domestic sector energy are about 99 per cent and 1 per cent respectively.

Field Operations

The cost and technical parameters attached to different fuel options, namely, diesel and animal power for their use in this activity suggest that the village should use animal power for field operations. The economic reasoning behind such solution can be studied. In this static analysis, we are to meet a given target crop production from a given land so that per hectare productivity requirement is determined. The operation takes place during a certain time-period in a year. The tractors (35 hp) can do this work quickly but at a higher cost whereas the animal power does the same at a lower cost but takes a longer duration. Under such circumstances, it is economical to use animal power with lower total cost, provided its productivity is high enough to meet the required level of land preparation within the given season.

If the productivity (per bullock-hour) of bullock is low, then it can be used for a longer duration to use its full capacity. This will reduce the per unit cost of bullock operation. This can be done also by using improved agricultural equipment. However, if the cropping intensity increases and/or if the production target is to be met only through large improvement in productivity, tractor operation may be cost-effective.

Lift Irrigation

Each of the four fuel options considered for this activity is assumed to be used with a particular type of appliance, shown below:

Energy Source	Appliance Considered	Capacity (hp)
Diesel	Diesel Pump	6.5
Electricity	Electric Pump	7.5
Animal Power	Persian Wheel	3.0
Bio-gas	Dual Pump	10.0

The optimal solution favours the use of electricity only in lift irrigation. The result remains the same irrespective of cost structures considered. The argument in favour of rural electrification has become stronger as it is also useful for minor irrigation. Therefore, if the electricity supply can be obtained from grid directly for agriculture without much of transmission losses, and the diurnal variation of electricity demand is not taken into account, electric pumps come out as the most efficient fuel source. This can decrease the demand for more diesel, the second best energy option for lift irrigation.

Rural Transport

In our formulation, we have considered rural transport which arises from the transportation of agricultural production. The transport in the domestic sector has not been taken into consideration owing partly to more use of human labour for which data are not easily available.

The result shows that tractor is more efficient than animal cart and, therefore,

TABLE A4 CALORIFIC VALUES AND EFFICIENCIES OF THE FUELS USED IN THE DOMESTIC SECTOR

Fuel Options	Calorific Values		Efficiency		
	Unit	K Cal/Unit	Useful Energy (K Cal/Unit)	Unit	Per Cent
Cooking					
Firewood (traditional)	Kg	4,700	470 00	Per kg	10
Firewood (improved)	Kg	4,700	1,410 00	Per kg	30
Cowdung (traditional)	Kg	2,130	149 10	Per kg	7
Cowdung (improved)	Kg	2,130	319 50	Per kg	15
Crop-residue (traditional)	Kg	3,500	245 00	Per kg	7
Crop-residue (improved)	Kg	3,500	525 00	Per kg	15
Kerosene (traditional)	Ltrs	8,947	3,757 74	Per litre	42
Kerosene (improved)	Ltrs	8,947	5,368 20	Per litre	60
Bio-gas	Cu m	4,725	2,835 00	Per cu m	60
Lighting					
Kerosene	Ltrs	8,947	89 47	Per litre	1
Electricity	Kwh	861	86.10	Per kwh	10
Bio-gas	Cu m	4,725	60 48	Per cu m	1.28

Note: For calculation of efficiency of bio-gas, we have assumed 2 cu m plant

Sources: (1) Application of a Rural Energy Model in Energy Planning (Part A), TERI, New Delhi, 1989.
(2) Sharma, EAS (1986)

diesel accounts for 100 per cent of the energy in rural transport. The result arises mainly because tractor (35 hp) has much higher capacity than a bullock cart (0.5 hp) in this activity. Thus the time taken for transportation of animal haulage by animal cart (traditional) is far more than a tractor so that the total cost is much more for the former. It has been seen that animal power is used only for field operations while the optimal fuel options in lift irrigation and rural transport are electricity and diesel respectively.

Field operations take place during a particular season in a year and animal power is required only for this season. We have assumed in our formulation that for using a bullock for one or more agricultural activities, it has to be maintained throughout the year and this requires a certain maintenance cost. Thus the number of bullocks used for field operations would remain idle for the rest of the year and the social marginal cost of draught

TABLE A5: CONSUMPTION OF DIFFERENT FUEL-SOURCES IN DIFFERENT ACTIVITIES OR END-USES (PER HOUSEHOLD PER ANNUM)

Fuel Sources	Cultivator I	Cultivator II	Cultivator III	Cultivator IV	Cultivator V	Landless Labourers	Artisans and Others

power use for these two activities can be assumed to be zero only.

An exercise has been done in this direction to look into the changes in optimal fuel-mix in lift irrigation and rural transport, if the cost of animal power is zero. The optimal solution shows no change in the previous fuel consumption pattern. This suggests that it is better to keep this animal power idle for the rest of the year after being utilised for field operations. In rural transport, the sensitivity analysis shows that even if the tractors are hired at Rs 60 per tractor-hour (as mentioned in the survey report) it would be cost-efficient to use tractor for this activity.

Limitations of the Study

1 The linear type of model rules out any possibility of economies of scale while we consider different levels of activities/end-uses in respect of different forms of energy and energy flows to different demand sectors. All these variables are treated as continuous variables while some variables change in discrete quantities in real life, e g, the animal population.

2 The linear programming model tries to yield a corner solution which, in real life, may not be seen due to some non-economic reasons. However, in our model, we have checked the pattern of the fuel consumption by putting more and more constraints on the availabilities of different fuels. The model can also be made more realistic if we incorporate parametric changes in different demand constraints for every year over a medium-run reference period.

3 As we have considered only constant cost coefficients in our analysis, the model cannot explain the price or cost changes endogenously.

4 We have not taken into consideration certain activities like water heating, etc, to avoid complications.

5 The fertiliser balance has not been taken into account. Thus the trade-off between the use of inorganic fertiliser and manure (produced from bio-gas plants) has not been considered.

Sensitivity Analyses

The model has shown remarkable stability when considered from the planning perspective The sensitivity analyses for the changes in the cost coefficients, especially for the commercial energy sources do not alter the optimal consumption pattern except for the instance of decreasing cost of diesel.

When diesel price falls by about 5 per cent, it emerges as the most efficient fuel source in field operations, and will substitute animal power Consequently, draught animal power will not be used in any agricultural operations and therefore, will not be maintained throughout the year, resulting in fall of cowdung availability Therefore, even if dung-cake appears to be the most efficient cooking fuel, followed by fuelwood, they together cannot meet the total cooking demand As a result, a more efficient energy source will be chosen, namely bio-gas Now cowdung as a raw material will contribute more towards the production of bio-gas as compared to dung-cake Moreover, the decrease in use of draught animals would imply a fall in the demand for purchased fodder

Another exercise has been attempted to measure the impact of the subsidy on bio-gas on the consumption pattern of fuelwood, which owing to its excess use is resulting in environmental destability It has been found that if the bio-gas cost is decreased by 61 per cent, fuelwood would be substituted partially But fuelwood consumption cannot be decreased to zero, because the bio-gas (and/or dung-cake together) cannot meet the cooking energy demand from the available cowdung If more cowdung is to be made available, the cost would increase as the draught animals are to be maintained without making them useful in any agricultural activity Therefore, if the government wants to curb the consumption of fuelwood, it has to bear a heavy cost, which may be taken as a rough estimate of the shadow value for environmental protection

V
Conclusions

All these results, discussed in Section IV may vary depending upon the cooking patterns, food habits, local availability of fuel sources, land use and cropping patterns, etc A centralised planning exercise, based on the aggregate data cannot capture these factors as these are location-specific The exigency of a village-level study is warranted in such a context However, in a vast country like India such a massive task is difficult to take place But if we look carefully, a broad similarity in the consumption pattern can be noticed in a specific agro-climatic zone. Thus a decentralised planning exercise of this kind should be undertaken for at least one sample village in each agro-climatic zone. Coefficients are supposed to be constant for regions having homogeneous socio-economic behavioural pattern of households, level of technology in agriculture, cropping pattern, etc But they may vary over a long time-horizon

Thus, the exercise is valid for application in planning for a time period for which the assumed state of art and technology of energy supplying sectors and the scenario of availability of energy sources remain unchanged In order to capture the impact of the changes in tastes and technology on optimal pattern of energy consumption for a perspective plan period, such exercises should be repeated at regular intervals with revised parameters and structural equations The advantage/utility of this kind of exercise should be judged by its qualitative nature of identifying the problem and finding out analytical solutions with certain degree of precision such that the role of the undermining factors in determining the optimal fuel mix can be understood Thus such exercises should provide building blocks for arriving at integrated rural energy plan and policy

Table A9: Final Results with Financial Costs and Economic Costs

Appendix

Mathematical Formulation of the Model

Under all the assumptions, mentioned in Section II we have formalised the model with the objective to minimise the total cost of the rural society in different energy sources subject to the fulfilment of energy requirements for different activities/end uses and also to the availability of different fuel sources In the model, the following indices are used

Index i energy sources used (with units mentioned in the parameters)

1 Fuelwood (kg)
2 Cowdung (kg)
3 Crop residue (kg)
4 Animal power (bullock-hour)
5 Kerosene (litre)
6 Diesel (litre)
7 Electricity (kwh)
8 Bio-gas (cubic metre)

Index j activities/end-uses considered.

1 Cooking
2 Lighting
3 Field operations
4 Lift irrigation
5 Rural transport
6 Bio-gas plant
7 Fodder

Index c: agricultural crops

1 Wheat
2 Bajra
3 Jowar
4 Barley
5 Guar
6 Gram
7 Mustard

Index h: animal type

1 Draught animal
2 Milch animal
3 Youngstock
4 Other animal

The objective function can be written as–

Minimise

$$\sum_i \sum_j P_{ij} * L_{ij} - P_m * \alpha * L_{26}$$

where, L_{ij} represents the use of i-th energy source for j-th activity.

P_{ij} represents the cost of i-th energy source for its use in j-th activity. This cost incorporates the cost of energy sources as well as the users' cost. The different energy costs, namely, economic costs and financial costs have been taken into account in two different exercises.

Again, P_m is the cost of manure produced from the bio-gas plant when cowdung is used to get bio-gas (L_{26}) for its different uses. This proportion by gas plant, i e, the amount of slurry (in kg) that is available from a kg of wet cowdung in bio-gas plant is represented by α. This has been done as we have not incorporated the fertiliser requirement balance in our model.

END-USE/ACTIVITY CONSTRAINTS

Cooking

$$\sum_i a_{ij} * L_{ij} \geq E_j \qquad \text{for all } i = 1,2,3,5,8 \quad j = 1$$

where, a_{ij} represents the useful energy obtained from one unit of i-th energy source for j-th activity and E_1 represents the useful energy requirements for cooking. The efficiency coefficients depend upon the appliances used for cooking. Based upon this, we have built up two scenarios—scenario I: when all the energy sources in cooking are used in traditional appliances; scenario II: when all the fuel sources are used in improved appliances in cooking.

Lighting

$$\sum_i a_{ij} * L_{ij} \geq E_j \qquad \text{for all } i = 5,7,8 \quad j = 2$$

where, b_{ij} is the useful energy obtained from one unit of i-th fuel source for j-th activity, and E_2 represents the total useful energy requirement (for lighting).

Field Operations

$$\sum_i c_{ij} * L_{ij} \geq \text{Gross Area Cultivated} \quad \text{for all } i = 4,6 \quad j = 3$$

where, c_{ij} represents the productivity of the i-th energy source for j-th activity, i e, the amount of land that can be cultivated by one unit of energy source i (when utilised) at its full capacity

Lift Irrigation

$$\sum_i d_{ij} * L_{ij} > \text{Total Irrigated Area} \quad \text{for all } i = 4,6,7,8 \quad j = 4$$

where, d_{ij} refers to the area that can be integrated by one unit of the i-th fuel source

Rural Transport

$$\sum_i e_{ij} * L_{ij} \geq T_j \qquad \text{for all } i = 4,6 \quad j = 5$$

where, e_{ij} represents the carrying capacity (weight-multiplied by distance) of one unit of i-th energy source for rural transport and T_1 is the total weight to be transported for a given distance.

AVAILABILITY CONSTRAINTS

Fuelwood Balance

$$\sum_i L_{ij} - \bar{L}_i \leq 0 \qquad \text{for } i = 1, j = 1$$

where, $\bar{L}_i$ represents the maximum fuelwood availability which is equal to the collected fuelwood by the villagers.

Cowdung Balance

$$\beta \sum_h \gamma_h * A_h - L_2 \geq 0 \qquad \text{for } h = 1,2,3,4$$

$$L_2 - \sum_j L_{ij} = 0 \qquad \text{for all } i = 2, j = 1,6$$

where, γ_h represents the dung available from one unit of livestock type h/year. A_h is the total livestock population of type h. However, all the dung production cannot be collected. Therefore, we shall assume that β proportion of the total cowdung is available for use in different activities/end-uses.

The last equation still needs some modifications. We should take into account the ratio of weight of wet and drydung. Taking this ratio of wet dung to dry dung as 5:1, our constraints should be rewritten as:

$$\beta \sum_h \gamma_h * A_h - L_2 \geq 0 \qquad \text{for all } h = 1,2,3,4$$

$$5L_{21} + L_{26} - L_2 = 0$$

when all cowdung is expressed in the wet form.

Bio-gas Balance

$$g * L_{26} - L_8 \geq 0$$

$$L_8 - \sum_j L_{ij} = 0 \qquad \text{for all } i = 8 \quad j = 1,2,4$$

where, g represents the bio-gas obtained from one unit of wet cowdung.

Crop-Residue Balance

$$L_3 - \sum_c \theta_c * X_c \leq 0 \qquad \text{for all } c = 1,2,\ldots,7$$

$$L_3 - \sum_j L_{ij} = 0 \qquad \text{for all } i = 3 \quad j = 1,7$$

where, X_c represents the agricultural production of crop c per year in the village considered and θ_c is the straw-grain ratio for crop c.

Fodder Balance

$$\sum_i L_{ij} + R_F + P_F - \sum_h f_h * A_h \geq 0 \qquad \text{for all } i = 3 \quad j = 7 \quad h = 1,2,3,4$$

where, f_h represents the average quantity of fodder intake (measured in dry equivalent of fodder) by an animal type h. R_F refers to the fodder obtained by raising the fodder land (given the land-use pattern). P_F is the amount of purchased fodder which is required to feed the livestock population after providing them with fodder and crop residues available within the village.

Total Animal Population Balance

$$\sum_h A_h - A = 0 \qquad \text{for all } h = 1,2,3,4$$

i e, the sum of different types of animal population must equal the total livestock population.

It is also assumed that the population of each type of animal is given as, in our analysis, we have considered the activity of draught animal only, the cost function only incorporates the cost of draught animal use. The cost will be incurred only if draught animal is used for any activity/end-use.

It is assumed that if the draught animals are not used in any of the agricultural activities, no cost will have to be incurred and the dung availability from and the fodder requirement for draught animal population will be zero. This is a reasonable assumption as the villagers may sell the bullocks if they do not use them. Thus the fodder requirement and dung availability vary with draught animal use in agricultural sectors. This shows that this constraints can be substituted by

$$A_1 \leq \bar{A}_1$$

where, $\bar{A}_1$ represents the maximum number of draught animals available.

Draught Animal Balance

$$K * A_h - L_4 \geq 0$$
$$L_4 - \sum_j L_{ij} = 0 \qquad \text{for all } i = 4,\; j = 3, 4, 5,\; h = 1$$

where, K represents the amount of animal power (measured in bullock hour) that can be generated by a single draught animal

However different agricultural activities take place in different seasons in a year It is assumed based upon the available information of the report that 40 per cent of the total bullock hours available from a single bullock can be used for field operations while lift irrigation and rural transport can get the maximum of 20 per cent and 40 per cent of the (annual) bullock hours respectively Thus the last equation can be rewritten as

$$L_{43} - 0.4 L_4 \leq 0$$
$$L_{44} - 0.2 L_4 < 0$$
$$L_{45} - 0.4 L_4 \leq 0$$

NON NEGATIVITY CONSTRAINTS

$$L_{ij} \geq 0$$
$$\text{for all } i = 1, 2 \qquad j = 1, 2, \ldots 7$$

Notes

[The author is greatly indebted to R P Sengupta Amal Sanyal and R Mukherjee for their kind and useful suggestions]

1 According to All India Census 1991 total population of India was 844 324 million (approx) of which rural population was 627 178 million (approx)

2 Sarkar and Kadekodi (1988) has shown that the consumer demand for fuel and light is relatively inelastic with respect to their aggregate consumption expenditure pattern to middle and higher income levels (Table below)

FUEL AND LIGHT CONSUMPTION PATTERNS IN RURAL INDIA

Per capita	Expenditure Groups				
Monthly expenditure	0 8	8 13	13 21	21 34	>34
Expenditure elasticities	0 825	1 044	0 563	0 539	0 532

Source Sarkar and Kadekodi (1988) p 14

3 Including of other non conventional energy sources in the model requires little change in the model However as the study concentrates on a village level exercise with no other existing non conventional sources we have not included any other new option for this medium run planning exercise

4 A summary of the basic data has been given in Annexure

5 For the study the annualised cost of 2 cu m bio gas plant including its capital and operation cost has been calculated While labour cost which may arise owing to bio gas expansion strategy has been taken up in a village with number of people with zero opportunity cost of employment the question of water could not be dealt with explicitly and was assumed to be met through independent policy initiatives However other problems related to bio gas operation as described by Prasad et al (1977) is to be taken care of for smooth operation through proper policy

NOTES TO THE FINANCIAL STATEMENTS FOR THE YEAR ENDED MARCH 31, 1994

(In thousands of Indian Rupees)

1 Summary of Significant Accounting Policies

(a) General

The accompanying financial statements have been prepared on the historical cost basis and conform to the statutory provisions and practices prevailing in the country

(b) Transactions involving foreign exchange

(i) Monetary assets and liabilities have been translated at the Foreign Exchange Dealers' Association of India exchange rates prevailing at the close of the year

(ii) Income and expenditure items have been translated at the exchange rates prevailing on the date of the transaction

(iii) Profit or loss on outstanding forward contracts have been accounted on an accrual basis

(c) Investments

Investments are valued at the lower of cost or market value

(d) Advances

(i) Provisions for doubtful advances have been made to the satisfaction of the auditors The provisions have been made based on management's estimates of potential exposure and taking into account guidelines issued by the Government of India and the Reserve Bank of India The net provisions have been included under other liabilities and provisions

(ii) Advances are shown net of bills rediscounted under the new Bill Market Scheme of Reserve Bank of India

(e) Fixed assets and depreciation

(i) Fixed assets have been accounted for at their historical cost

(ii) Depreciation has been provided on the straightline method at the following rates per annum

Furniture and fixtures	10%
Computers	25%
Other equipment	20%
Vehicles	20%

(f) Staff benefits

The Indian Branches have entered into an Employees' Group Superannuation Scheme with Life Insurance Corporation of India for providing retirement benefits to employees

(g) Net profit

The net profit disclosed in the profit and loss account is after

(i) provisions for taxes on income in accordance with statutory requirements

(ii) provision for doubtful advances

(iii) adjustments to the value of current investments

Auditors' Report on the Financial Statements under Section 30 of the Banking Regulation Act, 1949

We have examined the balance sheet of the Indian Branches of CREDIT LYONNAIS (incorporated in France with limited liability) as at March 31 1994 and the related profit and loss account for the year then ended Our examination was made in accordance with generally accepted auditing standards and, accordingly, included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances We have also obtained all the information and explanations which, to the best of our knowledge and belief, were necessary for the purposes of our examination and have found them to be satisfactory

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, and the provisions of sub sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the financial statements are not required to be, and are not drawn up, in accordance with Schedule VI to the Companies Act, 1956 The financial statements are, therefore drawn up in conformity with Forms A and B (revised) of the Third Schedule to the Banking Regulation Act, 1949

In our opinion the accompanying financial statements give a true and fair view of the state of affairs of the Indian Branches of CREDIT LYONNAIS as at March 31, 1994 and of its profit for the year then ended

Furthermore in our opinion,

(a) the transactions of the Indian Branches which have come to our notice have been within the powers of the Indian Branches of CREDIT LYONNAIS,

(b) the balance sheet and the profit and loss account are in agreement with the books of account, and give the information required by the Companies Act 1956 in the manner so required for banking companies, and

(c) the Indian Branches have maintained proper books of account as required by law insofar as appears from our examination of those books

Poverty and Income Distribution in India

K N Ninan

Against the background of global poverty and income distribution pattern, this paper analyses the trends and causal factors behind rural poverty in India both at the national and state levels during 1957-58 to 1986-87 Adopting an alternate model and categorisation of the time period of analysis into two phases which is empirically and theoretically justified the paper observes that contrary to the findings of other researchers, not only are there distinct time trends in the incidence of rural poverty in India, but also while these trends were positive and significant in Period I (1957-58 to 1968-69), they were negative and significant in Period II (1969-70 to 1986-87) Also, the rate of decline in the incidence of rural poverty in the latter period was much higher than the rate of increase in rural poverty in the preceding period These observations are valid for both all-India and across states, using alternate measures of poverty, i e, the head count ratio and Sen's poverty index The paper then attempts both a time series and cross-section analysis of the causal factors behind rural poverty in India, especially probing into the role of agricultural growth, inflation, access to subsidised food through the public distribution system, population pressure on environmental resources rural consumption levels and inequality, and infrastructure development on the incidence of rural poverty for all-India and across states

The paper suggests that policies to accelerate agricultural growth, infrastructure development and provide better access to subsidised food, along with measures to control inflation promise to be most effective in reducing the incidence of rural poverty in India Measures to control population growth and promote environmental conservation too ought to be incorporated into anti poverty alleviation strategies in India The paper cautions against the implications of recent policy changes in India, viz, structural adjustments, resulting in low priority to agriculture as against industry, slashing of public expenditures on social sectors including subsidised food, etc, which are detrimental to the poor and could reverse the negative trends in rural poverty visible after 1969-70

I
Introduction

SUSTAINED economic growth along with investment and public policies to improve labour productivity and access to basic needs are widely perceived to be most effective in reducing poverty The experience of the western countries earlier and more recently of those from east Asia bears this out On the other hand the experience of some of the south Asian and African countries shows how the absence of such a growth momentum and policy environment could constrain efforts to reduce poverty In some countries such as Brazil and Pakistan, despite rapid economic growth, progress in terms of social indicators like under five mortality, primary enrolment rates has been dismally low Whereas Sri Lanka, despite slow economic growth, ranked high in terms of social or quality of life indicators The countries of sub-Saharan Africa provide the curious combination of low economic growth and social progress resulting in endemic poverty Whether there are trade-offs between growth and poverty or inequality as suggested by the Kuznet's hypothesis or the Immiserisation hypothesis are difficult to surmise in the face of diverse evidences While countries like Japan, Korea recorded significant declines in poverty following a reduction in inequities after widespread land reforms, others like Indonesia were able to reduce poverty with the income distribution pattern unchanged, in still others such as Brazil, Costa Rica a worsening of poverty was associated with worsening inequities All these illustrate how complex a subject poverty is and that no study of poverty will be complete unless it takes note of local conditions and historical processes distinct to each country and region

It is in this context that this paper focuses on poverty in India The size of India's absolute poor (around 420 million people in 1985 with annual per capita incomes below US $ 370), the availability of time series data on poverty and related factors for a reasonable length unique for any developing country as also the diversity of situations and experiences make India ideal for analysing the dynamic processes and causal factors behind poverty Moreover, given the similarity of problems faced by many developing countries the Indian experience may also have lessons for other developing countries to imbibe Our focus is specifically on rural poverty This is because unlike many Latin American countries where poverty is largely an urban phenomenon, in India as in the rest of Asia and Africa it is largely a rural phenomenon The rural poor constitute about 80 per cent of India's total poor Apart from analysing the trends in rural poverty in India over time and states, the paper also attempts to analyse the factors influencing rural poverty in India both at the national and state level

Pioneering efforts in this direction have been made by Ahluwalia (1978), Narain [*vide*, Mellor and Desai 1985] and others [cf various articles in Bardhan and Srinivasan 1974, Srinivasan and Bardhan 1988, Krishnaswamy 1990] Ahluwalia's analysis for the period 1956-57 to 1973-74 revealed no underlying time trend in rural poverty in India and for most states. He also observed wide fluctuations in the inter-temporal incidence of rural poverty in India Other researchers using two point comparisons, tabular or graphic analysis, came to diverse conclusions While Bardhan (1973) observed a rising trend in rural poverty between 1960-61 and 1968-69, Minhas (1970) noted a fall between 1956-57 and 1967-68, Mellor and Desai (1985), Sundrum (1987) and Bhattacharya et al (1991) observed a zig-zag pattern in the inter-temporal incidence of rural poverty, rising for a few years, then falling, again rising and falling subsequently These contradictory findings may be attributed to the differences in methodology employed, the time period and choice of base and terminal years A major short-coming of most of these studies is that while attempting to draw inferences about underlying time trends in rural poverty, they implicitly assume that the time period under consideration is structurally and in terms of the policy environment favouring the poor homogeneous which is far from true. Adopting an alternate model and a categorisation of the time period of analysis into phases which is theoretically and empirically justified, we come up with more meaningful and consistent results These show that contrary to the findings of other researchers, not only are there distinct time trends in rural poverty both at the all-India and state-level, but also while these trends were positive and significant in one period, they were negative and significant in the subsequent period The rate of decline in rural poverty during Period II was higher than the rate of increase in rural poverty during Period I, both for all-India and most states. Our study also confirms the strong

negative association between agricultural performance and the incidence of rural poverty observed by Ahluwalia and others, using both all-India and inter-state data, and to that extent disproves the proposition of a weak link between agricultural growth and rural poverty put forward by some, notably Rajaraman (1975) and, Griffin and Ghose (1979). It also confirms the positive association between inflation and rural poverty observed by Narain But unlike Narain's results, ours are based on more rigorous tests covering not only all-India data, the head count ratio (as the dependent variable) and absolute prices but also inter-state data using alternate measures of poverty and price including examining the effects of lagged agricultural output and price variables on rural poverty We also extend our horizon beyond the narrow confines of the agricultural performance and price variables to also empirically study the relatively neglected issues relating to the role of population growth and environment, access to subsidised food through the public distribution system (PDS), the level of infrastructure development, inequality and other factors on the incidence of rural poverty The paper also questions on theoretical and empirical grounds the practice common among many poverty researchers of including a separate time trend variable as an additional explanatory variable in poverty functions to serve the role of a cover-all variable for all other time-related factors not explicitly considered in the given model In short, we not only seek to update and extend further the contributions of Ahluwalia, Narain and others in this area, but also overcome some of their shortcomings As mentioned earlier, in addition to trends in rural poverty at national and state level we also analyse the causal factors behind rural poverty in India This is at two levels—a time series analysis of factors affecting the incidence of rural poverty at all-India level and a cross-section analysis of factors affecting inter-state incidence of rural poverty at three points of time The data for the study are drawn from official reports and refer to the period 1957-58 to 1986-87

Before proceeding, it will be useful to situate the poverty and related question of income distribution in India in an international perspective Table 1 shows that south Asia (including India) with 23 per cent of the world's population alone accounts for almost half of the world's poor India's share itself is more than a third of the world's poor In terms of some social indicators India lags behind though in terms of life expectancy and net primary school enrolment rates India's position is better However, within India, some regions (e g, Kerala) are on par with developed countries in terms of social progress. India's per capita income in 1989 was US $ 340 which is higher than that of Bangladesh but lower than of Pakistan, Sri Lanka and China. Using the UN's ICP estimates, with the US per capita income as base with 100, India's per capita income which is 4 7 of this, is on par with that of Bangladesh, but less than that of Pakistan, Sri Lanka The income distribution pattern in India conforms to that in many countries For instance, the share in income of the bottom 20 per cent population in India and Japan is over 8 per cent each whereas that of the top 10 per cent are 27 and 22 per cents respectively The share of the bottom 20 per cent population in India is higher than in the UK, US, Brazil and several other countries But then the income levels in India are several times lower compared to in Japan, the UK US, Brazil and several other countries

II
Trends in Rural Poverty

Most poverty studies on India rely on the household consumer expenditure survey data collected by the National Sample Survey (NSS) for their analysis These are available almost uninterrupted on an annual basis from the mid-50s up to 1973-74 Subsequently

TABLE 1 POVERTY AND INCOME DISTRIBUTION A GLOBAL PROFILE

Countries/Regions	Percentage Share to World Total (in 1985)		Proportion of Poor (Head Count Ratio in Per Cent)		Social Indicators		
	Population	Poor	1985	2000 (Projected)	Under 5 Mortality (Per 1000 Births)	Life Expectancy (Years)	Net Primary School Enrolment Rate (Per Cent)
Sub Saharan Africa	9.4	16.1	47	43	196	50	56
East Asia	32.8	25.1	20	4	96	67	96
China	23.2	18.8	20	3	58	69	93
South Asia	23.0	46.6	51	26	172	56	74
India	17.1	37.6	55	25	199	57	81
Eastern Europe		0.5	8	8	23	71	90
Middle East/North Africa	8.3	5.4	31	23	148	61	75
Latin America and Caribbean	8.7	6.3	19	11	75	66	92
All developing countries	82.2	100.0	33	18	121	62	83

Countries	GNP Per Capita in US $ (1989)	UN's ICP Estimates of GDP Per Capita US=100 (1989)	Year	Share in Household Income by Percentile Groups of Households: Bottom 20 Per Cent	Top 10 Per Cent
Bangladesh	180	4.7	1981-82	9.3	24.9
India	340	4.7	1983	8.1	26.7
China	350	—	—	-	
Pakistan	370	8.2	1984-85	7.8	31.3
Ghana	390	--	1987-88	6.5	29.1
Sri Lanka	430	10.5	1985-86	4.8	43.0
Indonesia	500	—	1987	8.8	26.5
Colombia	1200		1988	4.0	37.1
Botswana	1600	19.3	1985-86	2.5	42.8
Malaysia	2160	—	1987	4.6	34.8
Venezuela	2450	—	1987	4.7	34.2
Brazil	2540	—	1983	2.4	46.2
UK	14610	66.1	1979	5.8	23.3
USA	20910	100.0	1985	4.7	25.0
Japan	23810	71.5	1979	8.7	22.4

Notes (1) The poverty line in 1985 purchasing power parity (PPP) dollars is $ 370 per capita a year for the poor

(2) Social indicators Under 5 mortality rates are for 1980 85 except for China and south Asia where the period is 1975 80 These are the probabilities of dying before age 5, life expectancy at birth—it is the number of years a new born infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life, net primary enrolment rate—the number of children aged 6 to 11 enrolled in primary school as a percentage of the population age 6 to 11 adjusted for each country's age structure for primary school the figures of the latter two indices refer to the mid 80s

(3) The UN's international comparison programme (ICP) has developed measures of real GDP on an internationally comparable scale using purchasing power parities (PPP) instead of exchange rates as conversion factors

(4) Income distribution For Bangladesh India Ghana and Indonesia data refer to per capita expenditure, for Pakistan—household expenditure, for Sri Lanka, Colombia Malaysia and Venezuela—per capita income, for remaining countries—household income

(2) *World Development Report 1991—The Challenge of Development* World Bank, Oxford University Press, New York, 1991

the NSS decided to collect these data on a quinquennium basis. However, with a view to building a time series of data a decision was again taken to collect such data on an annual basis from 1986-87 based on a smaller sample to supplement those from the quinquennium surveys. In the absence of time series data on household incomes, most poverty researchers in India have relied on the NSS consumer expenditure survey data. Moreover, consumer expenditure being a better proxy for permanent income is more suited for such analysis than household income data which may correspond to only current income. Most Indian researchers on poverty have used a poverty norm of Rs 15 monthly per capita consumption expenditure at 1960-61 prices for rural India to estimate the incidence of poverty in rural India [cf Dandekar and Rath 1971; Bardhan 1973; Ahluwalia 1978]. This expenditure was deemed to ensure a person access to a specified minimum bundle of goods and services. This norm was inflated for subsequent years using the Consumer Price Index for Agricultural Labourers (CPIAL) with the base 1960-61 = 100, collected by the labour bureau, government of India which is the only available rural-specific consumer price index. Because of variations in commodity prices and rates of inflation across states to derive the corresponding state-specific poverty lines this norm was adjusted using the state-specific consumer price indices for rural areas with the all-India rural price as 100 for a given year. Details as to how these are computed are available in a number of studies [cf Bardhan 1973]. The state-specific CPIALs are used to inflate the state level poverty lines for subsequent years. This norm has been used to arrive at the incidence of poverty for rural India as a whole and statewise. Of the measures used to estimate the incidence of poverty, the most popular are the head count ratio which estimates the proportion of poor with reference to the specified poverty line and the Sen's poverty index which is a more sophisticated and composite poverty index which takes note of the proportion of poor, the gap between the poverty line and the mean consumption of the poor and the Lorenz ratio of consumer expenditure of the below poverty households. Using the NSS consumer expenditure data and the above norms Ahluwalia (1978) estimated the incidence of poverty in India in terms of these two indices for the period 1956-57 to 1973-74. These indices have been updated up to 1986-87 for all-India and statewise by Suryanarayana and are readily available in a recent study [Mahendra Dev et al 1991]. These estimates supplemented by those from Ahluwalia's study have been used for our analysis.

Though our analysis spans a 30-year period, as mentioned earlier, we have only 17 observations at our disposal for analysis, because of gaps in the data cited earlier. This implies that while our trends are based on annual observations from 1957-58 to 1973-74, save for two or three missing observations, thereafter up to 1986-87 they are based on observations available at greater point intervals. Most of the trend fitting exercises earlier [cf Ahluwalia 1978] implicitly assume that the period to which the observations belong are structurally and in terms of the policy environment favouring the poor homogeneous which is far from true. It is our view that the period stretching from 1957-58 to 1986-87 can be broadly visualised as consisting of two phases, Period I from 1957-58 to 1968-69 and Period II from 1969-70 to 1986-87, the latest year for which poverty estimates were available at the time of writing. As is well known the green revolution marked an important phase in India's agricultural development when there was a structural break in the trend rate of agricultural growth. Due to the bad drought years of 1965-66 and 1966-67 and its after-effects the benefits of the green revolution were perceptible only from 1967-68/1968-69 onwards. Even a visual examination of the time series data reveals that the incidence of poverty measured in terms of the head count ratio or Sen's poverty index except for the late 50s generally showed an upward tendency and reached peak levels during 1965-68 and thereafter reversed to record a fall. The post-1969-70 period also marked an important shift in the policy environment towards the poor when following the split in the ruling Congress Party Indira Gandhi in a bid to outwit her political opponents and fulfil her 'Garibi Hatao' (Banish Hunger) slogan sought to give a pro-poor content to her party's programmes. Recognition regarding the limitations of the market mechanism in reaching the fruits of development to the poor and also political and economic compulsions, the post-1969-70 phase witnessed a spurt in poor-centred welfare programmes through direct institutional interventions such as Integrated Rural Development Programme, National Rural Employment Programme, Food for Works Programmes, Employment Guarantee Scheme, Mid-day Meal Schemes for school children, etc, focusing on improving their asset base, employment generation and providing access to basic needs, etc. Thus there are strong theoretical and empirical grounds to treat the period from 1957-58 to 1986-87 as consisting of two distinct broad phases, Period I from 1957-58 to 1968-69 and Period II from 1969-70 to 1986-87, as indicated earlier.

Now regarding the mechanics of our analysis. For fitting trends we have two options. One is to fit separate trends for the two sub-periods. But with only limited observations available we will be left with few degrees of freedom for econometric analysis if we fit trends thus. Moreover, this would also imply that our observations pertain to two different samples. Using an alternate methodology which overcomes these shortcomings we propose to estimate the trends for rural poverty in India, using the following model, viz,

$$g_t = a_0 + a_1 t + a_2 d + a_3 \; (d.t)$$

where, g = Head count ratio or Sen's poverty index; t = Time; d = Dummy variable where d=0 for Period I; and d=1 for Period II; d.t = Product of dummy and time.

The advantage of this model is in terms of more degrees of freedom at our disposal for econometric analysis; inferences about periodwise trends can be drawn from a single sample rather than two (as per the alternate methodology posed earlier), and more important it enables us to see whether the slope itself has undergone a change over the two periods. Linear trends using Ordinary Least Squares (OLS) method have been used to estimate the trends in rural poverty at all-India level and across states. The estimates for Periods I and II presented in Table 2 are derived from the estimated linear equations using the above model. The trends are calculated using two alternate measures of poverty, viz, the head count ratio and the Sen's poverty index, as mentioned earlier.

The results presented in Table 2 are quite interesting. Contrary to Ahluwalia's findings and those of other researchers who observed no underlying time trends in the incidence of rural poverty in India and for most states, our results show otherwise. Not only is there a distinct time trend in rural poverty in India but also while this trend was positive and significant in Period I, it was negative and significant in Period II. This is true irrespective of whether poverty is measured in terms of the head count ratio or the Sen's poverty index. Further the rate of decline in the incidence of rural poverty in the latter period was much higher than the rate of increase in rural poverty in the preceding period. These observations hold true at the state level too with most states reporting positive trends in rural poverty during Period I and negative trends in Period II with respect to both indices as well as the rates of decline in rural poverty in Period II being higher than the rates of increase in rural poverty in Period I. These trends (positive or negative) were statistically significant too in most cases. Interestingly three states, Andhra Pradesh, Tamil Nadu and Punjab reported negative trends in both periods. While our results indicate negative trends in rural poverty for India as a whole and across states after 1969-70, it may be noted that the absolute poor still constitute a significant component in India.

III

Factors Affecting Rural Poverty

An obvious question that arises is as to what are the factors accentuating or reducing rural poverty in India and across states. This is our concern in the remaining part of our analysis. Given the importance of the agricultural sector in the Indian economy—contributing as it does to about 40 per cent of the GNP and providing sustenance to more than two-thirds of the people—it is obvious that the fortunes of the rural poor in India are intrinsically linked to that of the agricultural sector. Ahluwalia's study cited earlier observed a close negative association between the incidence of rural poverty in India and agricultural growth. Agriculture impacts on the poor in more ways than one. A higher agricultural output helps lower food prices as well as improve food availability both of which are to the advantage of the poor. It will not only generate employment opportunities in the agricultural sector but also through its linkage effects spur growth in the non-agricultural sector too thereby creating income earning opportunities. Agricultural growth on the whole will give a fillip to overall economic development raising agricultural incomes. However, if agricultural growth involves a shift from labour-intensive crops and technologies to labour saving ones this could as well work to the detriment of the rural poor rather than beneficial since wages from agricultural employment constitute a major component of the incomes of the poor. Evidences from India, however, suggest that on the whole the green revolution resulted in a net increase of labour use and real wage rates [Dantwala 1985]. Some, however, feel that in the context of the institutional and structural constraints characteristic of most low income countries including India the beneficial effects of growth would be mostly expropriated by the non-poor [cf Griffin and Ghose 1979]. The trickle-down effect implied by Ahluwalia's finding of a negative correlation between agricultural growth and the incidence of rural poverty was thus

TABLE 2: TRENDS IN RURAL POVERTY IN INDIA, STATEWISE AND FOR ALL-INDIA, 1957-58 TO 1986-87

Notes: (1) These equations are derived from the estimated equations using the model mentioned in the text. The trends computed here are linear trends.
(2) *, **, ***—Statistically significant at 1, 5 and 10 per cent levels of significance. In the equations for Period II derived from the estimated equations, the significance of the constant term is inferred on the basis of the statistical significance of the dummy variable in the estimated equation, while that of the time trend variable is inferred on the basis of the statistical significance of the (d.t) variable.
(3) + – Trends computed separately for Punjab and Haryana are based on data for the period 1964-65 to 1986-87; Period I—1964-65 to 1968-69 and Period II as in all other cases.

Sources: The basic data for the above analysis were taken from Mahendra Dev et al (1990) and Ahluwalia (1978)

challenged by a number of researchers [cf Rajaraman 1975; Griffin and Ghose 1979]. However, these observations are based on weak theoretical or empirical support. To cite an instance, Rajaraman's empirical findings implying a weak causal link between agricultural growth and rural poverty was based on just 10 observations of which only four pertain to the post-green revolution period.

Another factor influencing the incidence of poverty is inflation. Inflation acts like a regressive tax hitting hard the poor leading to a deterioration in their entitlements and real incomes [Sen 1982; see also Sen in Mellor and Desai 1985]. Agricultural growth itself has an in-built inflationary or deflationary effect. A bumper harvest tends to depress prices whereas a bad harvest tends to push them up. Other domestic and external factors too such as demand-supply situation, import/export decisions, uncertainty, etc, also affect prices. Since food constitutes a predominant portion of the consumption basket of the poor it is the food prices which cause most anxiety to the poor. Dharm Narain's study [*vide*, Mellor and Desai 1985] highlighted the role of nominal prices in affecting the incidence of rural poverty. However, Narain's analysis was restricted only to all-India data, the head count ratio and absolute prices. There is a need to validate this further using data for regional disaggregates, alternate measures of poverty (say, the Sen's poverty index) and prices (relative prices too in addition to absolute prices), including the lagged effects of agricultural output and price on rural poverty. These are attempted in our analysis.

Population growth, poverty and environment are closely inter-linked. Rapid population growth impacts on poverty in many ways. It can offset the beneficial effects of economic growth on poverty as experienced by some of the south Asian countries. Moreover, poverty intertwined with rapid population growth exercises intense pressure on scarce environmental resources resulting in environmental degradation through overexploitation of fragile resources—all of which have an adverse effect on poverty. The role of the above factor on rural poverty too needs to be probed into.

A factor which is believed to have worked to the advantage of the poor in India particularly after 1969 is the plethora of poor-centred welfare programmes through direct institutional interventions. There is hardly any empirical attempt to test the influence of these programmes on rural poverty. Of the various institutional interventions, provision of subsidised food through a public distribution system (PDS) assumes importance for the poor. However, except in Kerala and other southern states the programme is largely urban-oriented, though it is gradually being extended to rural areas in some of the other states too. The specification of this variable posed problems for our analysis. Except for one year (1986-87) where the NSS have furnished data on commoditywise actual purchases from PDS to total purchases separately for rural and urban areas, time series data on PDS are available only in the form of PDS offtake aggregated for the rural and urban sectors. Rather than using a time trend variable (for a critique of this procedure, see below) to account for this factor we preferred to use the PDS variable as limited by the data availability expressing it in the form of PDS offtake to total net availability of foodgrains or alternatively the fair price shops per lakh of population except for the cross-sectional analysis pertaining to 1986-87 where actual data on PDS purchases to total purchases of foodgrains for rural areas have been used. Here only rice and wheat which account for bulk of the cereal purchases through PDS have been considered.

The role of other factors, viz, the rural consumption levels, inequality in rural consumption (a proxy for income inequality), and infrastructure development too need to be incorporated in our analysis.

It has also been customary for some researchers [cf Ahluwalia 1978; Rao and Mishra 1981; Narain *vide* Mellor and Desai 1985; and Saith *vide*, Bhattacharya et al 1991] to include a time trend variable as an additional explanatory variable in poverty functions to serve as a cover-all variable for all other time-related factors influencing poverty not explicitly considered in a given model. This implicitly assumes that all such time-related factors not accounted for have a unidirectional influence on poverty which is questionable. In fact, while some such time-related factors, for e g, rural population pressure on agricultural lands, could be expected to exercise an upward-push effect on poverty, others such as PDS offtake are expected to exercise a downward-push effect on poverty. The inclusion of a separate time trend variable in these circumstances is questionable and could even affect the estimates of other explanatory variables.

Keeping the above factors in view and the limitations of data, we propose to examine the causal factors behind rural poverty in India between 1957-58 to 1986-87. The analysis is at two levels—a time series analysis at all-India level and a cross section analysis of inter-state data. To test the robustness of our results the cross-section analysis of inter-state data is attempted at three points of time, viz, 1960-61, 1970-71 and 1986-87. While 1960-61 falls within Period I, 1970-71 and 1986-87 belong to Period II. Though some have expressed their reservations about cross-sectional analysis [cf Srinivasan, in Mellor and Desai 1985] others have felt that it is important in itself as it offers important perspectives on the varying conditions under which poverty occurs [Mellor and Desai 1985]. Moreover, some of the estimation problems one faces in time-series data (e g, multicollinearity, auto-correlation) pose a less serious problem in cross section data.

The variables for our analysis are as follows

Dependent Variable

Head count ratio (in per cent) or alternatively the Sen s poverty index

Independent Variables

To study the impact of agricultural growth (or performance) prices rural population pressure on environmental resources, PDS, rural consumption levels and inequality, and infrastructure development on rural poverty the following variables are considered

(i) Agricultural Output/Performance Variables (four alternate specifications)

NDPAGRI—Real Net Domestic Product from Agriculture at 1960 61 prices per head of rural population

NDPPRM—Real Net Dometic Product from Primary Sector (excluding mining and quarrying) at 1960 61 prices per head of rural population

INDAGRI—Index of Agricultural Production per head of rural population

INDFDGR—Index of Foodgrains Production per head of rural population

(ii) Price Variables (three alternate specifications)

FDPR—Consumer Price Index for Agricultural Labourers for Food Items (where 1960 61 = 100)

RELFDPR—Relative Food to General Consumer Price Index for Agricultural Labourers (1960 61 = 100)

RELCWPI—Relative Cereal to General Wholesale Price Index

(iii) Population Pressure on Environmental Resources

RPPAL—Rural Population Pressure on Agricultural Lands expressed in lakh population per ha of gross cropped area (so as to take note of land augmenting technologies which became prominent in Period II)

(iv) Institutional Intervention (PDS)

PDS—Proportion of PDS Offtake to Total Net Availability of Foodgrains

PDSFP—Fair Price Shops per lakh of population

PDSr—Proportion of Rice Purchased from PDS to Total Rice Purchases in Rural Areas

PDSw—Proportion of Wheat Purchased from PDS to Total Wheat Purchases in Rural Areas

(The last two variables were available only for 1986-87 and were used for the cross section analysis for the year 1986-87)

(v) Consumption Levels/Consumption Inequality

INEQRC—Lorenz Ratio of Rural Consumption

AVPCEG—Average Monthly Real per Capita Consumer Expenditure of the General Rural Population

AVPCEBD—Average Monthly Real Per Capita Consumer Expenditure of the Bottom Decile of the Rural Population

(vi) Infrastructure Development

INFDEVIND—Infrastructure Development Index as constructed by the Centre for Monitoring Indian Economy (CMIE), Bombay

Not all these variables have been included in an equation at a time because of the constraint of limited observations Further, while some variables, viz, NDPAGRI, RELFDPR, PDS PDSFP, INEQRC were common to both the time series and cross section analyses others, viz NDPPRM, INDAGRI INDFDGR RELCWPI, AVPCEG and AVPCEBD were included only in the time series analysis, similarly FDPR RPPAL PDSr PDSw and INFDEVIND figured only in the cross section analysis

In addition the agricultural output and price variables indicated above were also used in their lagged forms One could take a stand that the level of poverty in a given year is not only determined by that year's agricultural performance but also that of the previous year A good crop not only enables a poor household to repay past debts but also build up reserves to meet unforeseen eventualities Similarly inflation too has a lagged effect For instance given the low incomes of the poor a steep rise in prices of essentials may force them to borrow in order to arrest a deterioration if not maintain their consumption standards, the reverberations of which will be felt in subsequent years as well To take note of these lagged effects, an alternate specification of the agricultural output and price variables is introduced which is computed thus (t + t-1)/2 Thus in all we have four sets of equations In one set the dependent variable is the head count ratio, in another the Sen's poverty index. Within these two categories, again one set of equations are without lagged variables and another set with lagged variables

Multiple linear regressions using OLS technique were used to estimate the coefficients A few variables, viz, AVPCEG, AVPCEBD and RELCWPI had to be dropped from the analysis as these were found to be highly correlated with other explanatory variables The PDS variable was also found to be strongly correlated with the price variable RELFDPR and its lagged version in the time series analysis In such a situation it is common among researchers to drop one of the two collinear variables However this could affect the estimates of the retained variables [Koutsoyiannis 1977] particularly if it is an important one Using a procedure akin to Frisch's confluence analysis suggested by Koutsoyiannis which

enables one to test for the presence of multicollinearity and also adjudge which of such variables to include or drop, it was noted that inclusion of PDS resulted only in a slight improvement in the R^2 Hence in the time series analysis wherever price was included as an explanatory variable, the PDS variable was excluded However, because of our interest in knowing the nature of relationship between PDS and the incidence of poverty, we also fitted a set of equations excluding the price variable but including PDS Only those equations which gave meaningful results have been presented These estimated equations for the time series analysis are presented in Table 3

The results are quite interesting As evident while agricultural output variables are negatively correlated with the incidence of rural poverty measured in terms of either the head count ratio or the Sen s poverty index, the relative food price variable is positively correlated with poverty The coefficients are statistically significant in most cases These results are in conformity with the findings of Ahluwalia and Narain More noteworthy is that while the PDS variable has the expected negative sign, the inequality in rural consumption (a proxy for income inequality) is positively correlated with poverty This is true of both sets of equations where we have used or not used lagged variables as well as where the dependent variable are alternatively the head count ratio and the Sen's poverty index Thus our results suggest that while agricultural growth and PDS tend to reduce rural poverty, price and inequality in rural consumption which are positively correlated with poverty tend to push it up The R^2s of most of the equations are not only quite high but also they are much higher in the case of the equations using lagged variables, indicating the important role of dynamic factors in affecting the incidence of rural poverty

To analyse factors affecting the inter-state incidence of rural poverty in India we now turn to the results of our cross-section analysis presented in Table 4 Here again while agricultural growth was negatively correlated with poverty, price variable was positively correlated with poverty The PDS variable was negatively correlated with poverty Interestingly RPPAL and INEQRC were positively correlated with poerty indicating that rural population pressure on agricultural lands as well as inequality in rural consumption exercise an upward-push effect on poverty Infrastructure development index was negatively correlated with poverty, as it should be Again, as earlier, these observations generally hold true for the four sets of equations, i e, with/without lagged variables and where the dependent variable are alternatively the head count ratio and the Sen's poverty index The R^2s of most of the equations were quite high Thus our cross-section analysis reveals that while the incidence of rural poverty across states is negatively correlated with agricultural growth, PDS and the level of infrastructure development, it is positively correlated with price, rural population pressure on agricultural lands and inequality in rural consumption

IV
Conclusions

Contrary to the findings of other researchers of there being no underlying time trends in rural poverty in India, our evidence shows that there were distinct time

trends both in respect of the head count ratio and the Sen's poverty index. However while these trends were positive and significant in Period I (1957-58 to 1968-69) they were negative and significant during Period II (1969-70 to 1986-87). This phenomenon was true of trends for most states as well, though in three or four states negative trends were reported in both periods. Further, the rate of decline in rural poverty during the latter period was much higher than the rate of increase in rural poverty in the preceding period for all-India and most states. Our study observes a strong negative link between agricultural growth and the incidence of rural poverty in India while price was positively (and significantly too in a number of cases) correlated with rural poverty. These findings are in conformity with those of Ahluwalia earlier and more recently of Dharm Narain. Further our study shows that while access to subsidised food through the public distribution system is negatively correlated with rural poverty, rural population pressure on agricultural lands and inequality in rural consumption were positively correlated with rural poverty. The level of infrastructure development too was negatively correlated with the incidence of rural poverty.

The findings of our study suggest that policies to accelerate agricultural growth, infrastructure development and give better access to subsidised food through the PDS along with measures to control inflation promise to be most effective in reducing rural poverty in India. Measures to control rapid population growth and promoting environmental conservation too ought to be integrated into anti-poverty alleviation strategies in India.

A word or two about the implications of recent policy initiatives in India euphemistically called structural adjustments on rural poverty in India may not be out of place. The low priority accorded to agriculture compared to industry, the slashing of public expenditures on social sectors including food subsidies as part of the government's fiscal deficit pruning exercises are to the detriment of India's poor and if persisted could as well reverse the negative trends in rural poverty visible after 1969-70.

DISCUSSION

NEP and Trade Union Response

N Sundaramurthy

SARATH DAVALA ('New Economic Policy and Trade Union Response', *EPW*, February 19) has shown considerable sincerity in bringing into focus the multi-dimensional problems confronting the Indian trade union movement. De-politicalisation and de-unionisation of labour are global phenomena and union power is declining. The process has accelerated with the advent of new economic policy (NEP) and globalisation. Even in our country, we can come across instances where the number of non-members of any union is bigger than the membership of any union. Secondly, the loyalty of the union member is brittle. Outside the gates of the factory, the worker is guided by various other factors and acts in a manner that defy his class positions. Isn't it paradoxical that workers' combinations have not turned into vote banks in our country! It was said, trade unions are the schools of socialism. Well, let the matter be debated.

In the Indian context, two more factors need consideration: The emergence of caste welfare associations based on job reservations and 'feminisation' of labour. They were not new but their influence has widened. Karl Marx wrote about the Asiatic mode of production, as characteristic of India. Similarly, the two factors are typical and unique in the Indian context. Already the numerical base of the organised workforce is narrow. Within that, a new factor based on job reservations is on the rise. In most of the public sector industries and government offices, the constitutional provisions for SC and ST people in matters of recruitment and promotions are scrupulously implemented. The simple arithmetic is, roughly about 22.5 per cent of the organised workers belong to the SC and ST. This reform could come about due to the efforts of the mainstream trade union movement. However, the emotional integration, the necessary socialisation, has not occurred side by side. In a country already ravaged by a multiplicity of unions, an island of workers grouped on caste basis becomes disconcerting. The SC/ST employees are forming their own welfare organisations and show an increasing tendency to play into the hands of the government in times of strike struggles. In a situation of galloping unemployment, the caste factors can detonate social explosions. The organised trade union movement is sitting on a simmering volcano.

Second, the 'feminisation of labour'. The role of women in agriculture is well known. About 75 per cent of our country lives in the villages. Even in rural India, women constitute major part in the production process, in the agriculture and in the agro-based industries. They come under the unorganised sector. This sector, unfortunately, is not in a position to create public opinion. Public opinion is created by

the urban middle class who are the main base of the organised working class This section is educated, skilled, communicative and organised but constantly vascillating Among this section, the proportion of women is on the increase But the continuously increasing number of women employees does not reflect in the life of the trade unions and decision making They may have a grouse that they are doubly exploited, at home and in the workplace Then, there are the social factors and the misconceptions The woman is a mother, a wife, a cook and dishwasher and a wage-earner Her every activity is scrutinised, most of the times with prejudices and doubts Whether she is emancipated in the real sense is a matter of concern The reality is that women employees are not able to play a vital role in trade unions

Davala has suggested many things Trade union unity is undoubtedly of paramount importance In itself it is a political task It implies, trade unions must have politics and must be able to forge a cohesive unity based on common political understanding That is the answer against de-politicalisation that carries within it the deadly virus to de-unionisation and would fragment the trade union movement Trade unions can be delinked from political parties However, they cannot be delinked from politics The talk of 'no politics' for the workers is an ideological and political offensive

Second, the author suggests international solidarity of the working people as a measure against the globalisation of acute crisis perpetrated by the transnational agencies He also suggests workers' take-over of sick industries, i e, workers' sector, which to me, appears a romantic suggestion It has no doubt worked very well in Kamani Industries and Kerala Dinesh Beedi However, the idea is something akin to the collective forms in the erstwhile Soviet Union It did not work there, apparently The farmers did not feel a sense of belonging There are various difficulties For example, the Kamani experiment could not work in the plywood factory

As for the question of international working class solidarity, the backdrop is frustrating A split in the international communist movement with its ramifications on communist movements in different countries, the devastating set-backs suffered by socialism in Soviet Union and other east European countries, the capacity of capitalism to spring back and hold sway over the world and information imperialism have taken a heavy toll The Communist Party of India was split in 1968 These splits and fragmentations have done immense harm When one advocates the unification of trade unions, the other speaks in favour of forming a confederation. One union itches to grow at the expense of the other There is always that race for one up-manship It is the wheel within the wheel Some thing like 90 per cent of the workforce is unorganised Why is there no urge and initiative to organise them? All these questions are to be directed inwards Otherwise, as Davala has remarked, the already marginalised trade unions are bound to be overtaken by the structural adjustment programme

Lastly NEP will bring along with it its own miseries While more and more struggles are taking place, the ruling classes are resorting to counter-attack with lock outs and closures What can be the new weapon in the hands of the workers' movement? Has the weapon of 'strike' become obsolete? Can it be substituted by something else? Every struggle of the working people, in whatever form it occurs, is an expression of dissent against the ruling class and the government policies If all the struggles can be channelised on the basis of a common programme, cohesively and shorn of all sectarianism and demagogy, it will certainly unleash a tremendous force. Specifically, the two major communist parties must unite followed or preceded by the merger of all the mass fronts This appears inevitable Delay, distrust and cynicism will spell doom Unification of the communist movement will release a tremendous force in the country and will polarise the entire political process The democratic roots will grow deeper and stronger A whole new generation of new workers, the technocrats, the scientific community, the academicians and the ancillary social movements and above all, the movement of women will regenerate, coming under the healthy influence of the unified communist movement The overall impact of such a catalytic process on the trade union movement can hardly be missed
